22 July 2020

Dear Member

Extraordinary Meeting of Council – 29 July 2020

I am now able to enclose, for consideration at the Extraordinary Meeting of Council on 29 July 2020, these documents (all of Appendix 6 to the report) which were too large to be published with the Summons and have therefore been published separately.

6 **Local Plan Review - Inspectors Report on Adoption** *(Pages 3 - 1944)*

To receive and consider an extract from the minutes of the Cabinet meeting that took place on 9 July 2020 which includes recommendations to the Council.

Yours sincerely

Mrs Sarah Lees
Member Services Officer

Available in other languages and formats on request
Please telephone 01884 255255 or email customerfirst@middevon.gov.uk

To contact your local Councillor, his/her name and address can be obtained by visiting our website or telephoning Customer First on 01884 255255

Mid Devon DISTRICT COUNCIL

Local Plan Review: Options Consultation

Interim Sustainability Appraisal

January 2014

1 Background 3

2 Sustainability context 6

3 Sustainability appraisal methodology 21

4 Next steps 25

Appendix 1: Full review of plans and programmes

Appendix 2: Sustainability appraisal of policies and site options

1 Background

1.1 The Local Plan

1.2 Mid Devon's Local Plan sets the levels and distribution of development and strategic policies for the district. The document also sets out the infrastructure requirements needed to deliver the strategic objectives and states the policies by which development management decisions are made when determining planning applications. The existing Local Plan is made up of three parts:

- Core Strategy (adopted 2007)
- Allocations and Infrastructure Development Plan Document (adopted 2010)
- Local Plan Part 3: Development Management policies (adopted 2013)

1.3 Because the first part of the current plan was adopted seven years ago, it now needs to be brought up to date. The Council is therefore reviewing the targets, allocations, and policies contained within the current plan to reflect the latest evidence and guidance including the National Planning Policy Framework (2012). In reviewing the Local Plan, the Council has produced one document which will supersede the three parts of the existing plan. This new document, which is now out for consultation, is entitled 'Local Plan Review: Options Consultation'. The plan sets out the strategic options facing the district in terms of where new development could be located, and in what quantity. The Council will take account of the representations received during the Options Consultation to compile the final 'Submission' version of the Local Plan Review, which will contain preferred policies and allocations, and is scheduled to be made available in late 2014. It is anticipated that the final document will be adopted, following an 'Examination in Public' in 2015.

1.4 Purpose of the Sustainability Appraisal / Strategic Environmental Assessment Report

1.5 In order to be in accordance with EU and UK legislation, any plan must be subject to a Sustainability Appraisal/Strategic Environmental Assessment (SA/SEA). SA/SEA (or SA for short) assists in promoting sustainable development through integrating sustainability considerations into plan making. It is an iterative, ongoing process and integral to plan making. The process helps to consider the effects of the plan (and the effect without the plan) on the environment, on people and on the economy. It helps planning authorities to consider the merit of a variety of options to help determine the most sustainable policy decisions.

1.6 The SA highlights potential negative impacts of a plan, thereby providing the opportunities for these effects to be avoided or mitigated. However, the SA cannot ensure that development will be absolutely sustainable in all its aspects. Where harmful effects are noted, the SA can help to demonstrate how they can be mitigated. It is possible that in some cases development which is in some respects less sustainable may still have to take place, perhaps where the social and/or economic benefits outweigh environmental impact.

1.7 Interim Sustainability Appraisal

1.8 This SA builds on the initial findings set out in the Sustainability Appraisal Scoping Report (July 2013) which accompanied the Local Plan Review: Scoping Report, which was the first stage in the preparation of an SA for the new Local Plan. As set out in Government guidance on applying SA, the Scoping Report involved setting the context and objectives, establishing the baseline and deciding on the scope as follows:

- Identifying other relevant policies, plans and programmes, and sustainability objectives
- Collecting baseline information
- Identifying sustainability issues and problems
- Developing the SA framework
- Consulting on the scope of the SA

1.9 The next stage of preparing a sustainability appraisal involves the developing and refining of options and assessing their effects. Government guidance on undertaking a sustainability appraisal defines this stage as including the following aspects:

- Testing the plan objectives against the sustainability appraisal
- Developing plan options
- Predicting the effects of the plan
- Evaluating the effects of the plan
- Considering ways of mitigating adverse effects and maximizing beneficial effects

1.10 This SA sets out how these stages have been applied. It should be noted that this SA is only an interim report, having taken an initial assessment of the effects of the plan against the framework of indicators proposed within the scoping report. It includes a number of initial recommendations against each policy or site in order to mitigate their negative impacts or maximise the positive. The production of an interim SA, reflects the iterative nature of the appraisal process, and provides a basis against which policies and allocations can be continually assessed as the preparation of the Local Plan Review progresses. The final version of the SA will be produced alongside the Submission version of the Local Plan Review in late 2014. The final version will take account of any representations received during the consultation period regarding significant effects of the plan.

1.11 <u>Compliance with the Strategic Environmental Assessment Directive and Regulations</u>

1.12 The Environmental Assessment of Plans and Programmes Regulations (2004) set out certain requirements for reporting the SA process. The regulations specify that the SA report must set where it has met the SEA requirements. This is set down in the following table:

The SEA Directive requirements	**Section within this SA that meets the requirement**
Preparation of an environmental report in which likely significant effects on the environment of implementing the plan or programme, and reasonable alternatives taking into account the objectives and geographical scope of the plan or programme, are	The SA as a whole

identified, described and evaluated	
a) An outline of the contents and main objectives of the plan and the relationship with other plans	Sections 1, 2 and Appendix 1
b) The relevant aspects of the current state of the environment and the likely evolution thereof without implementation of the plan or programme	Section 2
c) The environmental characteristics of areas likely to be significantly affected	Section 2
d) Any existing environmental problems which are relevant to the plan including in particular those relating to any areas of particular environmental importance	Section 2
e) The environmental projection objectives, established at international, community or national level, which are relevant to the plan or programme and the way those objectives and any environmental considerations have been taken into account	Section 2
f) The likely significant effects on the environment, including on issues such as biodiversity, population, human health, fauna, flora, soil, water, air, climatic factors, material assets, cultural heritage including architectural and archaeological heritage, landscape and the interrelationship between the above factors. These effects should include secondary, cumulative, synergistic, short, medium and long-term permanent and temporary, positive and negative effects.	Appendix 2
g) The measures envisaged to present, reduce and as fully as possible offset any significant adverse effects on the environment of implementing the plan or programme	Appendix 2
h) An outline of the reasons for selecting the alternatives dealt with, and a description of how the assessment was undertaken including any difficulties (such as technical deficiencies or lack of know-how) encountered in compiling the required information	To be included in the final version of the SA
i) A description of the measures envisaged concerning monitoring	To be included in the final version of the SA
j) A non-technical summary of the information provided under the above headings	To be included in the final version of the SA

2 Sustainability context

Review of relevant plans and programmes

2.1 The first stage of undertaking a sustainability appraisal involves identifying and taking account of other relevant policies, plans and sustainability objectives. The Local Plan will not be a document developed in isolation – its content will be influenced by a large number of factors and policies defined by EU or UK legislation, national policies and other plans and strategies at a local level. Understanding the relationship between the Local Plan and these policies is important as it will influence the options considered in preparation of the plan. Information on these relationships will reveal where there are shared objectives or inconsistencies and constraints to be addressed.

2.2 The Scoping Report undertook this review of plans and strategies and grouped them into theme areas. Many of the themes cut across each other, however to permit an analysis they have be collated under particular headings. **Only the conclusions from the review of relevant plans are contained below; the full review of plans and strategies can be found within appendix 1**. The review of the relevant plans and programmes, and the sustainability considerations has been updated to take account of the representations made by the Environment Agency and Natural England following the publication of the Scoping Report.

Air quality

2.3 All the air quality-related policies/strategies reviewed emphasise the need to reduce carbon emissions as a key action to mitigate the effects of climate change. Reducing emissions is also a requirement in areas that suffer from poor air quality, such as in Crediton and Cullompton. Reviewed policies also encourage increasing the use of low carbon vehicles as part of a strategy to reduce emissions. These messages must be clearly reflected within the new Local Plan. The document should ensure that new development does not unacceptably contribute to poorer air quality, and that opportunities for reducing emissions are incorporated. New development should encourage the use of sustainable modes of transport, such as walking, cycling or the use of public transport. New development should also help to promote the market for low carbon vehicles by ensuring the delivery of electric vehicle charging infrastructure, or other latest technological infrastructure needed for low emission transportation.

Biodiversity and green infrastructure

2.4 The biodiversity and green infrastructure plans and strategies reviewed have at heart the need to conserve and enhance biodiversity. Policies should avoid the deterioration of habitats, and look to preserve, restore and recreate priority habitats, with no net loss in priority habitats. Development should provide net gains in biodiversity where possible, balancing the economic and social needs of development with the objectives of bio- and geo-diversity conservation. Policies should also give consideration to biodiversity enhancing development. The Council should consider whether playing field provision can be provided by private as well as public means. Advice from the Environment Agency notes that environmental issues can best be managed at the strategic level.

Climate change mitigation and energy

2.5 The UK is committed to achieving targets in reducing greenhouse gas emissions in order to tackle climate change, and development has a significant part to play to help achieve these targets. Planning needs to minimise vulnerability to the impacts of climate change, and support the delivery of renewable and low carbon energy development. Improving the energy efficiency of the fabric of buildings, particularly by encouraging low or zero carbon energy sources will limit CO_2 emissions.

Community and wellbeing

2.6 The reviewed plans and strategies set out the importance of delivering an integrated approach to new development. Building mixed inclusive communities, around a strong neighbourhood centre, with a mixture of housing, economic uses, community uses and services is a priority. Access to services, the creation of safe neighbourhoods and the availability of local greenspace and quality education and leisure facilities for young people are vital in the creation of healthy, inclusive communities. The provision of accessible, adaptable properties also allows older residents or those with disabilities to remain in their communities, close to family and friends, rather than having to move as their needs change. Residents should be able to influence decisions that affect them.

Economy and economic development

2.7 The planning system should support the development of strong, sustainable and balanced economic growth. Opportunities for meeting the needs of local and inward investment should be met by facilitating the growth of local businesses, both urban and rural, and providing sufficient land for employment. There should be sustained investment in business and transport infrastructure to improve connectivity. The regeneration of the market towns of the district should be supported with a particular aim to reduce the number of empty shops.

Historic environment

2.8 The planning system should set out a positive strategy for the conservation and protection of the historic environment, considering the value it plays in delivering sustainable, distinctive places that are enjoyed by local people. A balance needs to be struck where the priorities of maintaining and enhancing the built environment are balanced against the district's development needs. The impact on heritage assets of development should be proportionally considered in relation to their significance, with the most important nationally significant assets being given the utmost protection.

Housing

2.9 Nationally the country has not been building enough homes to house its population, and therefore significantly boosting the supply of homes is a priority. The proportion of the population of people above retirement age has increased and there is a need to provide appropriate housing in response. Providing for an ageing population or people with disabilities may need to be addressed through the delivery of homes that can be adapted as peoples circumstances change, or through the delivery of extra care housing. A wide variety of house

types should be provided, across a range of tenures to meet the needs of the population. In response to the fact that house prices are nearly ten times local earnings, there is a need to provide affordable housing to address long social housing waiting lists and others with a housing need. Such issues are also acutely felt in some of the more rural locations of the district, where house prices may be even higher, and will need to be addressed through affordable housing delivery to meet an identified need. Provision for the needs of gypsies and travellers should be made planned for which seeks to balance their locational, economic and social needs with the protection of amenity and the environment. There is a need for modern homes to be environmentally sustainable, and meet the consumer demands of the population, including provision of sufficient storage space and private outdoor space.

Infrastructure

2.10 The reviewed plans and strategies highlight the importance of delivering infrastructure to meet the needs of existing and new communities. The Government places great importance on the delivery of the following infrastructure as part of ensuring sustainable economic development: transportation, flood protection, communications, research, energy and waste. Community facilities and schools are important infrastructural elements that are required to meet the needs of local communities as part of the delivery of sustainable development.

Land

2.11 Soil is a fundamental natural resource that has often been degraded by human action. Soils should be protected and enhanced. Planning should consider allocating or developing land with the least environmental value, prioritising lower quality land. Consideration of the soil quality of best and most versatile agricultural land, and the need to remediate contaminated land should be a planning consideration. When considering development, the use of land should be optimised across a site to ensure the efficient use of building footprints whilst setting a density of development appropriate to local circumstances.

Landscape

2.12 Devon has a unique and valued landscape, which also contributes towards the tourism attraction of the county. Mid Devon has borders that are adjacent or in close proximity to two National Parks, whilst the Blackdown Hills Area of Outstanding Natural Beauty crosses the east part of the district. Planning policies should protect valued landscapes, offering protection and enhancement of the most valued such as National Parks and AONBs. The protection of the landscape needs to be balanced against the challenge of mitigating the effects of climate change through the transition to a low carbon future, particularly achieved through the development of renewables technologies, which are often located in rural areas.

Minerals

2.13 There needs to be a sufficient supply of minerals to ensure the long-term ability to deliver infrastructure and development. The need for a supply of minerals needs to be balanced with the priority of protecting the environment. Planning for minerals extraction does not fall within the remit of Mid Devon District Council, being instead undertaken by Devon County Council. However, the consideration of the environmental impact of materials used in buildings and the

desire to promote locally sourced materials is a district issue, as is the effect on local communities who are in close proximity to mineral workings.

Rural areas

2.14 The population in rural areas has grown at a greater rate than urban areas in the last decade. Rural businesses make a substantial contribution to the economy and should be supported to grow. Agriculture remains an industry that has faced many challenges in recent decades and such enterprises should be supported to diversify in order to benefit the rural economy. Rural areas experience social issues such as poor access to services and facilities, whilst the growth of their economies may be hampered by poorer broadband speeds.

Transport

2.15 Reducing carbon emissions produced as a result of transportation is a national priority. This can be achieved by increasing opportunities for the use of sustainable modes of transport, such as public transport, walking and cycling; through the delivery of opportunities to increase the use of electric vehicles and improving the connections between various modes of transportation; improving the condition of the local transport network and protecting existing transportation assets. Ensuring safe and sustainable transport options are available to communities is also a priority.

Waste

2.16 National waste priorities are to protect human health and the environment whilst ensuring the delivery of sustainable waste management. Reducing the carbon footprint of waste will also contribute towards tackling climate change. New development should contribute to sustainable waste management, through the application of the waste hierarchy where disposal is the last resort, instead prioritising re-use, recycling or recovery.

Water

2.17 Managing flood risk and the effects of climate change is a key European, national and local priority, particularly as Mid Devon has suffered serious flooding in the past. There is also growing pressure on water resources and a need to improve resource efficiency. In particular new housing and commercial development should incorporate measures to improve water efficiency and reduce surface water run-off which can contribute to flooding. Water bodies should be protected from the effects of pollution, and there should be no reduction in their quality or status. Consideration should be given to the Water Framework Directive, and the objectives of the South West River Basin Management Plan when planning for development which could impact on the water environment.

<u>Description of the area's baseline characteristics and future changes</u>

2.18 The next stage undertaken within the Scoping Report involved focusing on collecting baseline information about Mid Devon. The information collected provides a basis for predicting and monitoring effects and helping to identify sustainability problems. The information collected is

drawn from a mixture of sources from national plans and strategies and combined with local monitoring data.

2.19 Much of the information represents generic data about the district, rather than specifically generated information in relation to the development of the Local Plan. Some of it will have been relevant in the production of previous local development documents, whilst other data will have been updated more recently. Some information may not be up to date, but may be the most recently available. The information provided covers a broad range of environmental, social and economic matters which collectively understood help to assess sustainability.

Location

2.20 Mid Devon is an inland area in the south west of England, lying roughly equidistant between the Bristol and English Channel coasts. The significant urban areas of Exeter (population 117,800) and Taunton (63,000) are just beyond the southern and eastern boundaries of the district respectively. Major east-west transportation routes run through the district, including the M5, A361, A30 and the Great Western Mainline Railway.

Physical characteristics (including landscape)

2.21 The district of Mid Devon covers an area of 353 square miles (914 sq. km) in the heartland of Devon. It lies between Dartmoor, Exmoor and the Blackdown Hills. From the centre of the district, the north and south coasts of Devon are each about 30 miles away. The majority of Mid Devon's settlements are nestled within the folds of the landscape, with many small historic settlements containing thatched cottages and ancient churches. Tiverton is the main town within the district, with the two smaller market towns of Cullompton and Crediton.

2.22 The Mid Devon district forms the heart of the Devon countryside, linked to the south coast by the River Exe with its valley and surroundings. The intricate course of the River Exe is the most defining landscape feature in Mid Devon, providing a continuous thread flowing from the northern extremities of the district down to the south near Thorverton. To the east the Blackdown Hills have a unique geology and provide an often isolated and valued distinctive rural landscape.

2.23 The Culm Valley to the east is a low lying flat prosperous agricultural area, with good soil fertility. The north and northwest of the district is a high flattish landscape with a rather unsheltered windswept appearance, formed by the Culm Measures, so called for its underlying thin bed of coal known locally as 'Culm'. The farming hinterland to the north of Crediton, often referred to as the Mid Devon farming belt, has all the typical elements that make up the distinctive Devon landscape, with its varied patchwork of irregular shaped fields with green pastures.

2.24 Natural England has divided England into Natural Character Areas, with Mid Devon falling into three distinct areas: the Culm, the Devon Redlands and the Blackdowns. The Mid Devon Landscape Character Assessment provides further more localised characterisation. The Devon Redlands has a very strong, unified character. The underlying red sandstone and consequent red soil dominate the landscape through ploughed fields, cliffs and exposures, and are visually evident in the traditional stone and cob farmsteads, hamlets and villages that are scattered

across the area. Not only does the soil visually characterise the area but its fertility also makes it the agricultural heart of Devon.

Biodiversity and green infrastructure

2.25 The varied nature of Devon's geology and landform has led to a considerable range of biodiversity. There are various protected species found in Mid Devon, such as woodlark, bats and dormice. In comparison with the rest of Devon, Mid Devon has relatively little land designated as being of national importance and no designed or candidate European sites. Within Mid Devon there are 12 Sites of Special Scientific Interest (SSSI), three local nature reserves and two nature reserves managed by Devon Wildlife Trust. Mid Devon has over 8 sq. km. of ancient woodland. The district supports a range of important wildlife including over 200 County Wildlife Sites and Regionally Important Geological Sites.

2.26 Changes in wildlife populations and habitat have occurred throughout the last century and show a general trend of decline. The main threats to biodiversity include environmental pollution, land use change, fragmentation and invasive species introduction. These pressures are likely to continue and biodiversity may also be affected by climate change and recreational pressure. Hedgerow removal and unsympathetic conservation of rural buildings can impact on important species identified in the Devon Biodiversity Action Plan.

2.27 In particular the RSPB's State of Nature Report (June 2013) stated that 60% of species on which they hold data are in decline, whilst 31% have declined strongly. Half of the species assessed have also shown strong changes in abundance or distributing, indicating that recent environmental changes are having a dramatic impact on the nature of the UK's land and seas. In particular species with specific habitat requirements are faring worse that generalist species that are better able to adapt to a changing environment. Action needs to be taken to save nature for its intrinsic value and for the benefits it brings to us that are essential for well-being and prosperity.

2.28 Natura 2000 sites, which are hierarchically the most important sites for biodiversity, are protected under European legislation. Natura 2000 sites include Special Areas of Conservation (SACs) designated for species and habitats and Special Protected Areas (SPAs) designated for birds. Whilst there are no Natura 2000 sites within Mid Devon, there are six within 5km of the district's boundary. The six sites include:

- Hare's Down, Knowstone and Rackenford Moors (North Devon)
- Exmoor Heaths (North Devon and West Somerset)
- Exmoor and Quantock Oak Woodlands (North Devon and West Somerset)
- Holme Moor and Clean Moor (Taunton Deane)
- Quants (Taunton Deane)
- South Dartmoor Woods (Teignbridge)

2.29 The Hare's Down, Knowstone and Rackenford Moors site is considered to be at greatest risk from development, due to its location on the A361 and proximity to the Mid Devon boundary. The A361 is the main route into North Devon from the M5 motorway, providing a vital tourism link as well as a certain amount of commuter and shopping traffic in either direction. Natural

England has advised that any development that encourages through-traffic may impact on the SAC.

2.30 There are many other elements that form part of the district's green infrastructure. These include 476 miles of Public Rights of Way and two regional walking routes (Two Moors Way in the west and Exe Valley Way from North to South). These routes are used recreationally by walkers, cyclists and horse-riders, but many rights of way provide short enough connections through and between towns and villages that they are realistic choices for people travelling to and from work and school.

2.31 The Environment Agency note that the local water environment performs a valued role in contributing to well-functioning ecosystem services. In Mid Devon there are a variety of rivers running through the district, including the Exe, Culm and Creedy, as well as a number of small contributory streams. These play a role as habitats and ecological networks for local biodiversity. The same applies to the Grand Western Canal, a County Wildlife Site.

Climate change mitigation and energy

2.32 Forecasting the future impact of climate change is particularly challenging, though there is extensive scientific evidence that the world's climate is changing. The UK Government has stated that if the global average temperature rises more than 2^{o}C above pre-industrial levels, significant negative impacts of climate change will be more likely and the cost of managing them will rise sharply. To have a 50% chance of keeping climate change to within 2^{o}C of pre-industrial levels, global greenhouse gas emissions need to peak before 2020 and then decline steeply. Evidence suggests at present emissions are continuing to soar. On 10 May 2013, concentrations of CO^2 in the atmosphere passed 400 parts per million, the highest level in 50 years of data collection, and a peak not estimated to have been experienced for three-five million years (the Pliocene period, a time when the arctic was ice-free and sea levels were 40 metres higher than today).

2.33 There are many risks associated with increasing climate change. These include threats to agriculture as a result of higher demand for water resources, reduction in productivity in farming or forestry land as a result of drought or conversely as a result of flooding. Businesses are likely to be effected by increased risk of flooding, competition for water, energy and materials and the disruption of transport networks and communication links. The flooding and resultant disruption to the Great Western Railway line near Stoke Canon in December 2012 highlights the potential impact on the region. The natural environment could be affected resulting in increased concentrations of pollutants in low water levels or reduced river flows damaging freshwater habitats and other ecosystem services; warmer rivers, lakes and seas impacting on biodiversity; flooding impacting on key habitats; ocean acidification affecting species and habitats and changes in seasonal events.

2.34 These effects will be experienced at a time when national energy reserves are declining. Much existing energy infrastructure is in the process of closing as it reaches the end of its operational life, whilst domestic fossil reserves of oil and gas are declining. The amount of spare electricity capacity in the system could fall from 14% (in 2012) to 4% by 2015/16 (Statutory Security of Supply Report, 2012).

2.35 To ensure there is sufficient energy to meet the UK's energy needs, and to mitigate the impacts of climate change there is a need to increase our reliance on low carbon technology. In the last few years this has resulted in increased delivery of renewable electricity generation in Mid Devon, typically in the form of large scale solar photovoltaic farms and to a lesser extent onshore wind turbines. To date there has been less development of renewable heat. Mid Devon has also been able to ensure the delivery of solar PV cells on the roofs of all local authority owned housing.

2.36 Whilst Government pays subsidies in the form of tariffs for renewable energy and maintains a positive approach to moving to low carbon energy sources, pressure for such developments within Mid Devon is likely to increase – particularly given the district's location (i.e. annually more sun in the south, and more wind as the area is exposed to the prevailing south westerly winds). However, this has implications for conflicts that may arise as a result of landscape impacts, particularly given the proximity to National Parks and the Blackdown Hills AONB. Historically, large-scale renewable energy developments have often been vocally opposed by local communities.

2.37 Mitigating the effects of climate change will also require the use of lower carbon resources in the construction industry, particularly as part of the development of houses and other buildings. Buildings will need to use fewer resources through the use of materials with a lower lifecycle carbon use, whilst simultaneously increasing energy and resource efficiency. Building regulations have been gradually amended to improve the energy efficiency of homes which will have affected the carbon output of recent new builds nationally. However, within Mid Devon, the delivery of homes which meet the higher categories of the Code for Sustainable Homes has not been a priority. This trend may start to be reversed as a result of new policies within the Local Plan Part 3 requiring all new major housing development to meet code level 3, rising to code level 5 by 2016. As the Local Plan progresses the housing standards that will be sought will depend on the outcomes of the 'Housing Standards Review' consultation which will set out a range of standards to be considered.

Community and wellbeing

2.38 The health of people in Mid Devon is generally better than the England average. However, life expectancy is 4.9 years lower for men in the most deprived areas of Mid Devon than in the least deprived areas. Over the last 10 years all-cause mortality rates have fallen. About 16.9% of Year 6 children are classified as obese, whilst levels of teenage pregnancy and smoking in pregnancy are lower than the England average. Priorities for Mid Devon include addressing healthy weight in childhood, cardiovascular skin disease, skin cancer prevention, alcohol use and smoking. The Council's Green Infrastructure Plan also recognises that access to public rights of way, playing fields and recreational open space is an essential aspect of public health and wellbeing.

2.39 Despite the impact of the recession, incidents of recorded crime have continued to fall year on year since 2007/08. Furthermore, the area is one of the lowest for recorded crime within Devon and Cornwall. Should the economic downturn continue it is unclear whether this pattern will be able to continue. Social deprivation, however, has increased across the district since 2007, with approximately 1,900 children living in poverty (Mid Devon Health Profile,

2012). Deprivation is highest in Tiverton, Cullompton and in some of the more remote rural areas.

Economy and employment

2.40 The majority of Mid Devon's employment falls within the service sector, which includes occupations where knowledge and time are offered to improve productivity. Examples include transport and distribution, retail and services such as accountants or building surveyors. This sector accounts for 76.7% of Mid Devon employment (Economic Trends Report, August 2012).

2.41 There are low levels of inward commuting and a strong 'pull' from neighbouring urban areas, especially Exeter. Forthcoming data releases from the 2011 Census will provide up-to-date information about travel-to-work patterns. The available information from the Annual Population Survey (2008) estimates that of the people working in Mid Devon, only 25% commute in from outside the district, while only 57% of Mid Devon's working residents stay in Mid Devon for work.

2.42 The district profile produced for the Local Economic Assessment (2012) found that there is a high level of self-employment within Mid Devon, and the district is above the Devon average for business density (number of businesses per working age person) and business start-ups. While school-level attainment is above average for the county, this does not translate to a highly skilled resident workforce, implying that high-attaining school leavers are not staying in Mid Devon.

2.43 The Council commissioned a Retail Study in 2012, to assess both demand and the capacity of the local catchment areas to support different sorts of retail growth. The report highlighted that Mid Devon's market towns are in a vulnerable position, similar to other small-medium sized towns across the country. The study identifies common trends, such as national retailers consolidating their businesses in larger regional centres, while internet shopping also takes trade away from town centre shops. Retail forecasts predict weak growth in spending, resulting in possible reductions in town centre retail space, with these effects potentially being most acutely felt in Crediton and Cullompton. Out-of-centre retail development may be most attractive to developers due to lower land values but may harm the existing town centres. Regeneration of the town centres, particularly as Tiverton is in receipt of government regeneration funding as part of the 'Portas Pilot' programme, is a priority, but one that faces significant challenges.

2.44 Tourism also represents a small but important sector within the district. Devon is a popular destination for domestic tourism, though traditionally Mid Devon has not been a significant recipient of tourism spend as visitors bypass the district en route to other parts of the county, particularly those areas closer to the coast. Previously, tourism development focused on the small scale provision of visitor accommodation, often on farms that were diversifying their activities. A Mid Devon Peer Challenge undertaken in early 2013 highlighted tourism as an economic area on which the district could capitalise. Further detail on the type of tourism offer that should be pursued will be presented by the forthcoming Tourism Study. It is likely this will prioritise modest sized developments seeking to capitalise on existing assets, such as the district's location and rural nature, including its proximity to two National Parks.

Historic environment

2.45 Mid Devon is a district with a rich historic and cultural heritage. There is a wealth of historic buildings and features throughout the district, with over 2680 listings of buildings, bridges and milestones. The district has three historic parks and gardens of national importance – Knightshayes, Bridwell Park and Shobrooke Park, with 16 of local value. The area also has 50 conservation areas and 49 scheduled ancient monuments, including castles, roman forts, stone crosses, bowl barrows, a henge, abbey, ring ditch, iron age earthworks, camps, a Romano-British villa, Neolithic causewayed enclosure and a hillfort. In addition there are a wide range of archaeological remains which are not scheduled.

2.46 The four main towns of the district all have a particular historic importance. Tiverton has its origins in a ford across the Rivers Exe and Lowman and has an attractive historic centre and a rich legacy of buildings of all periods. Crediton is a historic market town with medieval burgage plots that can still be discerned in the south side of the High Street. Cullompton is an old town with two grade I listed properties and some ninety grade II. Bampton was formerly a market town and has the mound of a former medieval motte and bailey castle.

2.47 However, whilst the heritage of the district is critical to local character, there is not comprehensive coverage of documents that provide an aide to protection. Of the 50 conservation areas, only 12 have conservation area appraisals and four have conservation management plans. Whilst the four main towns and a number of the larger villages are all covered, other villages and smaller settlements within the district have no coverage. Production of additional appraisals has slowed in recent years, with only two new CAAs adopted since 2008 (another is currently in draft). Cullompton has an Article 4 direction in place, which offers a degree of protection over and above that of the conservation area designation. Plans to put in place a similar directive in Bradninch were discussed but have not been adopted. There are currently 22 heritage assets in Mid Devon that are considered by English Heritage to be at risk of degradation for various reasons. The Heritage at Risk Register identified three conservation areas (Bow, Cullompton and Tiverton), two buildings and 17 scheduled monuments at risk.

2.48 There are also potential conflicts between the protection of heritage assets and mitigating the impact of climate change. In particular this is played out where home owners wish to install renewable energy features, such as solar PV arrays on roofs in a conservation area or on a listed building. Such developments may not positively contribute to local character or may reduce the significance of the heritage value of a building. This represents a potential conflict of sustainability objectives.

Land

2.49 Building on previously developed land, “brownfield land”, avoids the need to use greenfield land for new housing. In recent years, Mid Devon has developed a high proportion of new housing and employment on brownfield sites, with totals of 59% of new or converted housing and 57% of new employment development in 2011/12. This trend is not likely to continue as previously developed land is a finite resource, which is relatively scarce in a rural setting such as Mid Devon. Government policy encourages the effective use of brownfield land, provided that

it is not of high environmental value; however this approach is less strict than previous national policy. Conversely, national policy now provides less support for the long-term protection of employment land for development for alternative uses. This could mean existing brownfield land being used for housing, potentially reducing the overall amount of greenfield that needs to be allocated.

2.50 Government guidance also states that planning should consider the economic and other benefits of the best and most versatile agricultural land. A national grading system has been in place since the 1960s which classifies the quality of agricultural land based on factors based on soil, climate and site. At the time of original mapping the breakdown of grades within Mid Devon was as follows:

Grade	Percentage land coverage
1	3.48%
2	11.01%
3	64.44%
4	19.86%
5	0.05%
Non-agricultural	0.28%
Urban	0.89%

Source: MAFF (1966)

2.51 This mapping, produced by Central Government, has not been updated on a district-wide basis since it was originally commissioned. However, it is unlikely to have changed significantly despite the growth in urban areas in the last forty years and it highlights the very low levels of the best quality agricultural land available within the district. Any loss of this resource would need robust justification.

Minerals

2.52 Responsibility for minerals planning is a function of Devon County Council. However, Mid Devon is the setting for a number of locations of mineral extraction. Strategic mineral sites producing minerals of national importance or making a significant contribution to delivering sub-regional aggregates include the winning of limestone at Westleigh.

Population and housing

2.53 The release of data from the 2011 Census has shed new light on population trends in Mid Devon. In combination with other data sources, this helps to build a picture of changing household composition and long-term needs. The population according to the census is 77,750, an increase of approximately 11% upon the 2001 figure, a rate of growth that has risen faster than the rest of Devon, the South West and England. The median age of Mid Devon residents has also increased, from 41 to 44 reflecting both regional and national trends of a population that is living longer. The number of households within the district has also increased by 13% within the last ten years, reflecting not only population growth, but changing societal demographics such as older people continuing to live independently in their own

homes for longer and the growth in single parent households. Average household size has stayed consistent at 2.4 over the last decade.

2.54 House prices in Mid Devon are higher than the averages for Devon, the South West and England and Wales. While house prices have fallen slightly since the economic downturn, average 2011 were still 89% higher than they were in 2001 and there are signs that the ratio of house prices to earnings is rising again, with fewer people now in full-time employment.

2.55 Affordability remains a critical issue, and with the Mid Devon population having risen 11% between 2001 and 2011, there is a mismatch between the overall availability and the demand for affordable housing. The Mid Devon Local Housing Needs and Demand Survey 2011 indicated a need for 335 additional affordable dwellings each year to address the backlog of unmet need over the last 10 years. Over that 10 year period, total housing completions in Mid Devon averaged 349 dwellings per annum, the majority of these being market rather than affordable dwellings. Existing plans allocate sufficient land to meet the strategic target of 6,800 dwellings up to the year 2026, but other factors such as mortgage and developer finance availability will have had an impact on housing delivery since 2009.

2.56 The Council intends to commission a new Strategic Housing Market Assessment in partnership with some of our neighbouring district councils. This will provide definitive, up-to-date information on the level of housing need and demand across the Exeter Housing Market Area. Local planning authorities are required to cooperate with each other on strategic planning matters.

Resources

2.57 Energy is a crucial consideration in the functioning of the economy, and one area of concern is the future of non-renewable sources of energy, particularly oil. There has been much discussion about the notion of 'peak oil' in recent decades, the theory being that production of oil will peak in coming decades, with demand outstripping supply. Whilst there is academic disagreement on the reality of the peak oil theory, there is growing consensus that the age of cheap oil is coming to an end. Declining production of existing older oil fields will exacerbate production problems. As a result, more than two thirds of current crude oil production capacity may need to be replaced by 2030, simply to prevent production from falling. This is likely to be extremely challenging, and will likely result in necessary demand reduction and sourcing alternative sources of energy supply. Local effects of peak oil will include increased costs for fuel, with significant rises already having taken place, affecting motor vehicle users, but also passengers on public transport facing higher fare costs. As the government seeks to deliver a balanced future energy supply, there is likely to be greater desire to deliver renewable energy developments, with pressure particularly felt in rural areas for onshore wind and solar farms.

2.58 There is also uncertainty over the future supply of phosphorus, which is an essential ingredient in fertilisers, and plays a critical role in contributing to modern agricultural production. Some researchers have predicted that phosphorus reserves are expected to be completely depleted within 50-100 years, though this is not universally agreed. Such reductions will have a significant impact on farming productivity, land use and food supply.

2.59 Water is essential for human life and to sustain a diverse and thriving water environment. It is important to our economy as an essential requirement for industry, power generation, commerce and agriculture. Over the next 30 years, there will be increasing pressures from rising populations and associated development. Looking further ahead, the impact of climate change could have a major impact on water that will be available for all uses.

Rural areas

2.60 National government statistics classify Mid Devon as a 'Rural-80' based on the location of the local population. This statistic refers to the fact that over 80% of the population are resident in rural settlements (including those with urban areas with between 10,000 and 30,000 population regarded as 'larger market towns'). Classifying Mid Devon as a 'Rural-80' local authority puts it in a category of the most rural local authorities within the UK.

2.61 Rural businesses are a key element of the local economy. There is a growing trend for individuals to set up their own businesses, particularly in rural areas where areas such as Mid Devon can provide a high quality of life and where transport costs and distances can encourage home-working. Broadband access and speeds can be a key issue for rural-based businesses. A programme to connect Devon and Somerset with superfast broadband is underway which will result in speeds of at least 24Mbps to at least of 85% of homes and businesses by 2015. However, many rural areas currently receive less than 2Mbps at present, which may hinder the start up or expansion of rural businesses.

2.62 Access to services is also an issue for rural areas. Statistics for the whole of Devon show a decrease in the number of households within good transport access to key services or work. Levels of public transport providing services to 55 villages in Mid Devon have shown a decrease since 2006. In particular the number of daily services to these settlements has shown a steady decline across this period.

Transport and air quality

2.63 As a rural area, Mid Devon has a high dependency on the car, particularly as public transport provision and coverage is far from extensive, and has shown signs of contracting. These factors are reflected in the level of car ownership, which has increased at both national and local levels. The average household in Mid Devon now owns 1.47 cars, as opposed to 1.33 at the time of the previous census. The percentage of households owning 2, 3 and 4 or more cars has all increased, whilst the share of those who do not own a car has fallen. In particular, the ratio of cars owned per household in Mid Devon has continued to grow at a consistent rate whilst growth in the national level has shown signs of levelling off. High levels of car ownership have not been affected by planning policies to restrict parking provision in recent developments. This has led to inappropriate or anti-social parking, rather than a reduction in car ownership. Future developments should make suitable provision for parking in order to reflect the rural nature of the district and levels of ownership. Neither does it appear that higher fuel costs have had an effect on car ownership, though high levels of ownership do not always translate into high levels of usage.

2.64 High levels of car ownership and hotspots of poor local road infrastructure have impacted on local air quality. Both Cullompton and Crediton were designed as Air Quality Management Areas in 2006 and 2004 respectively. Principal actions to address the excessive levels of Nitrogen Dioxide and particulates in the air include the development of the Crediton Link Road and two relief roads within Cullompton. Work to provide the Crediton Link Road has already commenced, however to date there has been no progress on new roads in Cullompton. Funding is being provided by Central Government to undertake improvements to both junctions 27 and 28 of the M5, however this may only reduce some of the congestion experienced at the Cullompton turn-off.

Waste

2.65 National policy on waste prioritises reduction, re-use or recycling in order to prevent waste going to landfill. Local authorities will experience increasing costs as a result of waste going to landfill, which will need to be reduced by using alternative methods of waste management, particularly given the severe pressures that are on Council finances as a result of Central Government funding cuts. There are also implications for climate change as a result of how waste is managed. In many cases carbon acts as a good proxy for the overall environmental impacts of waste: generally speaking, the higher up the waste hierarchy waste is treated, the smaller the greenhouse gas impacts.

Water

2.66 Mid Devon has suffered serious flooding in the past, and the risk of flooding is likely to increase in the future as a result of climate change. Forward planning must take account of this risk to ensure that new development is sustainable. Winter rainfall is predicted to increase by 15-30% by the 2080s as a result of climate change, with a concomitant 20% rise in peak river flow. Impermeable surfaces of buildings, roads and pavements limit infiltration and increase the volume and rate of surface water runoff. Future development may increase the area of impermeable surfaces unless a sustainable approach to water management is adopted that promotes sustainable urban drainage and improved water efficiency within buildings. A new Strategic Flood Risk Assessment will need to be commissioned once options for future development have been produced. The conclusions from this assessment will need to be used in determining the final strategic and site-specific options in the Local Plan. The assessment will need to consider the status of Mid Devon's existing waterbodies in relation to the Water Framework Directive, and ensure that the priorities of the South West River Basin Management Plan are reflected in the final conclusions.

Sustainability issues and problems

2.67 The next stage undertaken within the Scoping Report involved the identification of any sustainability problems that relate to Mid Devon. These issues will have been highlighted as part of the review of relevant plans and programmes and the baseline data for the district set out earlier in this document. The initial list may expand further as a result of consultations undertaken as the Local Plan is prepared. The issues identified will also inform the sustainability objectives which form the basis of the framework to appraise the Local Plan strategy and policies as set out in the next section of this document.

2.68 This scoping report has highlighted the following sustainability issues within Mid Devon:

- Small areas of social deprivation within Tiverton, Cullompton and some of the remote rural areas (including high levels of child poverty)
- Large population growth within the last decade and demographic household change leading to the need for new housing, particularly affordable housing given the high ratio between prices and local earnings
- Houses have not previously been constructed of a sufficient size to meet the needs of the modern family
- Access to services and facilities for rural communities has worsened and may continue to do so
- Biodiversity levels continuing to fall, often dramatically for some species
- Low levels of the best quality grade 1 agricultural land across the district
- Pressure to develop primarily on greenfield sites as fewer brownfield sites remain or require costly remediation
- The need to avoid disposal of waste, instead prioritising re-use, recycling or reduction
- Rich historic environment across the district, though some heritage assets at risk
- Climate change objectives can conflict with the conservation of the area's historic environment, particularly in the installation of renewables technologies that may impact on heritage assets
- Pressure for the installation of renewable energy developments to meet energy shortage
- Increased risk of flooding as a result of climate change
- Potential for negative impact on the Water Framework Directive status of waterbodies across the district as a result of development
- Low delivery of low or zero carbon homes to date
- High car dependency across the district, with levels of car ownership having grown and continuing to grow
- Traffic congestion and poor air quality within Crediton and Cullompton
- Low levels of inward commuting but strong out-commuting, especially to Exeter and the potential loss of employment within Mid Devon
- Low retention of high-attaining school leavers
- Rural self-employment or small business start-up is a growing sector, however this may be constrained by poor broadband speeds
- Declining town centre health with town centre regeneration having the potential to be affected by any new out-of-centre development

3 Sustainability appraisal methodology

Developing the plan and options

3.1 This is the second consultation that has taken place as part of the preparation of the Local Plan Review. The initial consultation, undertaken during July and August 2013, set out the scope of the review and the issues facing the district, and sought feedback on the broad direction of development for the district over the next 20 years. That consultation included no policies or sites. The current consultation sets out the options available to the district, including a range of strategic options in terms of where growth is focused over the next twenty years. A range of sites across the district where this growth could be located have also been included. The sites presented are options only, with the Council having stated no preference for the strategic decisions that will need to be taken.

3.2 This SA accompanies the Local Plan Review, providing an assessment of the sustainability impacts of the policy options. The SA will be updated following the consultation period to take account of the responses received during the consultation. Natural England and the Environment Agency made a number of recommendations about the content of the Scoping Report. These have been incorporated into this version of the SA. In summary, their responses stated the following:

- The document should include and take account of National Character Areas, which are currently being revised by Natural England (links to the relevant profiles were provided)
- Environmental issues should be addressed at a strategic level, with a holistic approach being applied to all biodiversity and green infrastructure eneds
- The plan should recognise the importance of land management and its implications for the ecological quality and status of a river
- Access to open green space should be referenced in relation to community and well-being
- Reference to water as a resource should be included
- A Strategic Flood Risk Assessment should be undertaken in parallel with the revised Local Plan. Information regarding the Water Framework Directive status of waterbodies in Mid Devon should be included, with reference to the South West River Basin Management Plan
- The framework of indicators should be updated to consideration of impacts on the following indicators: 'resilience to climate change' and 'water resources'
- The Mid Devon Green Infrastructure Assessment, the South West River Basin Management Plan and the Water Framework Directive should be added to the list of relevant plans and programmes

3.3 The Local Plan Review: Options Consultation contains a range of strategic policy options and sites. It contains more sites than the Council will need to allocate. Some of the sites are listed as preferred sites. These have been stated as preferred as they are already allocated, and therefore have been subject to public consultation and Examination in Public as part of the process for adopting the Allocations and Infrastructure Development Plan Document (AIDPD) in 2010. It is therefore the Council's intention that they should be carried forward into the new Local Plan. The sustainability of these sites has previously been subject to appraisal alongside the preparation of that document. Though stated as preferred, they are still to be subject to

ongoing sustainability appraisal and consultation as part of the process of preparing the new Local Plan.

Sustainability appraisal framework of indicators

3.4 A framework is used to understand the sustainability effects of the Local Plan as it is being developed. This framework is central to the process of sustainability appraisal. A framework has been developed consisting of sustainability objectives, each of which includes a number of elements against which a policy will be appraised. The framework includes all those factors highlighted within the Scoping Report that will affect the sustainability of the Local Plan.

3.5 The framework below represents a more simplified approach than that used in previous Mid Devon SAs. This approach is considered to offer greater flexibility as the draft Local Plan contains both high level strategic policies, site allocations and detailed policies to guide development management decisions. This new framework can be applied to all these policies equally.

Sustainability objective	**Elements covered**	**Impact**
A) Protection of the natural environment	Habitats and biodiversity; flora and fauna; protected species; landscape	
B) Protection and promotion of a quality built environment	Heritage assets, including listed buildings, conservation areas, scheduled ancient monuments, registered parks and gardens, locally listed assets, archaeology; design and quality of development	
C) Mitigating the effects of climate change	Reduced flood risk; promotion of low carbon or renewable energy; reductions in carbon emissions; resilience to climate change; walking and cycling provision; low carbon buildings	
D) Safeguarding and minimising resource use	Quality of soils, including contaminated land; water quality, including consideration of water framework directive objectives; water resources; minimisation of waste; impact on best and most versatile agricultural land	
E) Promoting economic growth and employment	Increasing jobs; reducing out-commuting; skills training; growth of rural businesses; tourism provision	
F) Supporting retail	Safeguarding the vitality and viability of town centres; relationship between new development and town centres; supporting viability of shopping facilities in villages	
G) Meeting housing needs	Supply of housing; housing mix; house size; housing affordability; appropriate housing density to location; proximity to services and facilities	
H) Ensuring community health and	Community support for proposals; access to open space and recreation; limiting air, noise and light pollution to levels that do not damage human health or natural systems; integrated	

Sustainability objective	Elements covered	Impact
wellbeing	and sustainable forms of travel including walking, cycling and public transport; social deprivation; safe and secure environments	
I) Delivering the necessary infrastructure	Roads and transportation; schools; health services; community facilities; green infrastructure; telecommunications	

3.6 The sustainability objectives proposed are distinct from the objectives of the Local Plan, though they may in some cases overlap with them. They will provide a way of checking whether the Local Plan objectives are the best possible ones for sustainability and will test the social, environmental and economic effects of the plan. The indicators are not fixed, and can be amended, if required, in response to input received as a result of the Preparation stage consultation exercise.

3.7 In order to consider the impact of the Local Plan against the sustainability objectives, a scoring system is proposed to be used. A score will be provided against each of the objectives to highlight a policy or proposal's sustainability impacts. Collectively, this will allow consideration of a policy's overall impact and permit comparison with other policies or proposals. Where negative impacts are highlighted, it will also permit proposals or policies to be modified and then rescored in order to determine whether their sustainability impacts have been made more positive.

3.8 The use of a scoring system with a range from +3 to -3 will highlight the scale of any potential impact. This offers more scope than the approach taken in the most recent SA of the Local Plan Part 3 where only a positive, negative, zero or indeterminate outcome could be used – a system which could not easily differentiate between a marginal or significant impact.

3.9 The following table sets out the scoring system that has been used:

Score	Rationale
+3	The policy/proposal will have a significant positive contribution towards achieving the objective
+2	The policy/proposal will have a positive impact in contributing towards achieving the objective
+1	The policy/proposal will have a minor positive impact in contributing towards achieving the objective
0	The policy/proposal will have no impact or will have some positive and some negative impacts thereby having a balanced effect in contributing towards achieving the objective
-1	The policy/proposal will have a minor negative impact in contributing towards achieving the objective

-2	The policy/proposal will have a negative impact in contributing towards achieving the objective
-3	The policy/proposal will have a significant negative contribution towards achieving the objective

3.10 In addition to the scoring process, a summary of information against each indicator has been provided. This summary describes the impact against each of the sustainability objectives, setting out the nature of the impact, how each is experienced and whether any of the impacts noted are offset by other effects of the policy. It also sets out mitigation measures that have been applied to reduce, where possible, any negative impacts identified. The nature of impacts, whether they are secondary, cumulative, synergistic, temporary, permanent, short, medium or long-term is also considered.

3.11 Below each policy a summary of recommendations has also been set out. These reflect recommendations that have arisen as a result of applying the SA process to each policy. These recommendations, form advice provided by the SA but they have not been incorporated in the policies at this stage. They reflect the iterative nature of the SA process, and may be used to amend the policies during the preparation of the final version of the Local Plan.

3.12 The assessment of all policies and potential sites can be found in Appendix 2.

Sustainability Appraisal Omissions

3.13 Mid Devon is considering including a policy on self-build housing also known as custom build housing which could also include community-led housing projects to provide affordable homes for the benefit of the community. Should the Council choose to introduce a new policy on these matters a corresponding Sustainability Appraisal will be undertaken which will form part of the final version of the SA.

3.14 Mid Devon also seeks views on a number of Local Green Space designations intended to preserve smaller open areas within or near to settlements for the long term because of the special associations that a place has for the local community. These designations have not undergone Sustainability Appraisal as they are designated under the National Planning Policy Framework (NPPF) rather than being a local policy decision.

4 Next steps

4.1 During the consultation period, representations on the contents of the Local Plan Review and this accompanying Sustainability Appraisal are invited. Representations can be made by any interested party on the policies as set out within the Local Plan Review, or the effects of these policies contained in the SA. The Council will take account of these representations following the consultation period. These will help inform the final draft of the Local Plan Review, which the Council anticipates will be made available for a final consultation period late in 2014. Details of how to make a representation can be found on the Local Plan Review page, on the Council's website, which can be found at:

www.middevon.gov.uk/localplanreview

Appendix 1: Reviewed plans and programmes (full list)

Air quality	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
The 2008 Climate Change Act	The Climate Change Act sets statutory emissions reduction targets to at least 80% below the level of net UK emissions of targeted greenhouse gases in 1990.
The Carbon Plan: Delivering our Low Carbon Future (HM Government, 2011)	The Carbon Plan sets out how the UK will achieve decarbonisation within the framework of energy policy. Within the next 10 years the plan requires the development and deployment of new technologies that will be needed to halve emissions in the 2020s. Domestic transport emissions account for nearly a quarter of UK emissions; to achieve target vehicles will need to run on ultra-low emission technologies such as electric batteries, hydrogen fuel cells and plug-in hybrid technology. These changes will bring environmental benefits including improved local air quality. Encouraging the use of public transport, cycling or walking will boost the reduction in emissions.
The Air Quality Strategy for England, Scotland, Wales and Northern Ireland – Volume 2 (DEFRA, 2011)	The Air Quality Strategy points to certain pollutants where national objectives are in some cases being met, and others not. Pollutants described include: lead, benzene, 1,3-butadiene, carbon monoxide, particulate matter, nitrogen dioxide, ozone, sulphur dioxide and polycyclic aromatic hydrocarbons. Levels for many of these emissions are closely related to transport use, which planning policies will need to consider means to reduce those reaching unacceptable levels.
The Air Quality (Standards) Regulations 2010	The Air Quality (Standards) Regulations transpose into English legislation the requirements of EU directives on air quality and cleaner air. It sets air quality standards for key pollutants and requires the UK to demonstrate how the standards will be achieved and maintained when compliance is breached. Particular attention is given to reducing particulate matter, a pollutant associated with transport emissions, exposure to which can exacerbate existing respiratory conditions.
National Planning Policy Framework (DCLG, 2012)	The NPPF requires local authorities to encourage solutions that result in reductions in greenhouse gas emissions and promote sustainable transport. Local plans should aim to minimise pollution, and should prevent new and existing development from contributing to or being adversely affected by unacceptable levels of air pollution.
Code for Sustainable Homes (DCLG, 2010)	Category 6 of the Code for Sustainable Homes aims to reduce the emissions of gases with high global warming impact associated with the manufacture, installation, use and disposal of foamed thermal and acoustic insulating materials. Building elements affected include roofs, walls, floors, hot water cylinders, cold water storage tanks and external doors. Credits towards achieving levels of the code can be achieved by reducing the use of materials with a high global warming impact. Application of the code is one method for

	reducing emissions at point of manufacture, installation and disposal. Such actions can contribute to the achievement of building sustainable homes.
Local Transport Plan 3, Devon and Torbay Strategy 2011-2026 (Devon County Council, 2011)	The Devon Local Transport Plan states that technology has a key role to play in reducing emissions which affect air quality. To support the market for electric vehicles it requires a network of charging points to be delivered in convenient locations for residents. Capital priorities include improving air quality in Cullompton and Crediton through the delivery of relief/link roads.
Mid Devon Corporate Plan 2012-2015	The Mid Devon Corporate Plan notes that there are areas of poor air quality within the district, especially within the Exeter Road area of Crediton, and Cullompton High Street and Station Road. The Local Plan will need to consider how new development impacts on existing, and areas at risk of poor air quality.
Mid Devon Sustainable Community Strategy 2010-15	There are air quality issues within Crediton and Cullompton. Tackling these is a priority.
Air quality – sustainability conclusions All the air quality-related policies/strategies reviewed emphasise the need to reduce emissions as a key action to mitigate the effects of climate change. Reducing emissions is also a requirement in areas that suffer from poor air quality, such as in Crediton and Cullompton. Reviewed policies also encourage increasing the use of low carbon vehicles as part of a strategy to reduce emissions. These messages must be clearly reflected within the new Local Plan. The document should ensure that new development does not unacceptably contribute to poorer air quality, and that opportunities for reducing emissions are incorporated. New development should encourage the use of sustainable modes of transport, such as walking, cycling or the use of public transport. New development should also help to promote the market for low carbon vehicles by ensuring the delivery of electric vehicle charging infrastructure, or other latest technological infrastructure needed for low emission transportation.	

Biodiversity and green infrastructure	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
European Water Framework Directive (European Commission, 2000)	The European Water Framework Directive (WFD) came into force in December 2000 and became part of UK law in December 2003. It provides an opportunity to plan and deliver a better water environment, focusing on ecology. It provides an opportunity to plan and deliver a better water environment through river basin management planning.

'The Natural Choice' Natural Environment White Paper (DEFRA, 2011)	The paper set out a framework for protecting and enhancing the natural environment. It proposed the introduction of Nature Improvement Areas, in order to provide bigger, connected sites for wildlife to live in and adapt to climate change in both urban and rural areas. Local Nature Partnerships. It also proposed new ways for developers to provide biodiversity offsetting, to ensure wildlife sites are not lost. Also proposed were Local Nature Partnerships to strengthen joined up action across local agencies and government.
Natural Environment and Rural Communities Act 2006	The act places a duty on public authorities (replacing s74 of the Countryside and Rights of Way Act 2000) to have regard to biodiversity as far as is consistent with the proper exercise of their functions. The act also requires the government to publish, review and revise lists of living organisms and types of habitats in England that are of principal importance for the purpose of conserving biodiversity.
Countryside and Rights of Way Act 2000	Requires local authorities to have regard to nature conservation when performing rights of way functions, including power to divert ROWs away from SSSIs. The act gives greater protection to wildlife and natural features by making provisions for the conservation of biodiversity, and improving protection for SSSIs.
Wildlife and Countryside Act 1981	The act sets in place protective measures for wildlife, including wild birds and plants. The act requires local authorities to take steps to bring the protection of wildlife to the attention of the public and schoolchildren. The act (though subsequently amended) allows designation of Sites of Scientific Interest (SSSIs) setting their management and protection measures, and also allows the designation of national nature reserves.
Conservation of Habitats and Species Regulations 2010 (and Amendment 2012)	Translates the EU 'Wild Birds Directive', requiring the protection of biodiversity through the conservation of natural habitats and species of wild fauna and flora. It places a new duty on relevant authorities to protect and create bird habitats, and a duty to avoid pollution or deterioration of bird habitats. The document also states the list of European protected species of animals and plants. The regulations require land use to plans that are likely to have a significant effect on a European site to make an appropriate assessment of the implications for the site in view of the site's conservation objectives. The local authority may only give effect to the land use plan after having ascertained that it will not adversely affect the integrity of the European site.
Biodiversity 2020: A strategy for England's wildlife and ecosystem services (DEFRA, 2002)	The strategy sets a mission for the next decade requiring a halt to overall biodiversity loss, support to healthy well-functioning ecosystems and to establish coherent ecological networks, with more and better places for nature for the benefit of wildlife and people. In particular, reducing environmental pressures on biodiversity is a specific concern. This will be undertaken through reforms of the planning system to ensure a strategic approach to planning for nature will be undertaken. The protection and improvement of the natural environment is a core objective of the planning system. Biodiversity offsetting will be piloted to assess its potential to deliver planning policy more effectively. Particular targets (to be achieved by 2020) include 90% of priority habitats in favourable or recovering condition, and at least 50% of SSSIs in favourable condition, while maintaining at least 95% in favourable or recovering condition. Additional targets include bigger and less fragmented areas for wildlife, with no net loss of priority habitat and an increase in the overall extent of priority habitats by at least 200,000ha.

England Biodiversity Strategy – Climate Change Adaptation Principles (DEFRA, 2008)	The document sets out principles for conserving biodiversity and protecting them from the direct and indirect impacts of climate change. The principles include conserving existing biodiversity, conserving protected areas and all other high quality habitats, conserving the range and ecological variability of habitats and species, maintaining existing ecological networks, creating buffer zones and high quality habitats, understand change is inevitable, make space for the natural development of rivers and coasts and raise awareness of the benefits of the natural environment to society.
National Planning Policy Framework (DCLG, 2012)	The planning system should contribute and enhance the natural and local environment by recognising the wider benefits of ecosystem services; by minimising impacts on biodiversity and providing net gains in biodiversity where possible, contributing to the Government's commitment to halt the overall decline in biodiversity by establishing coherent ecological networks that are more resilient to current and future pressures. Distinctions in policies should be made between the hierarchy of international, national and locally designated sites, so that protection is commensurate with their status. Policies should plan for biodiversity on a landscape wide scale; promote the preservation, restoration and re-creation of priority habitats, ecological networks and the protection and recovery of priority species.
Code for Sustainable Homes (DCLG, 2010)	Category 9 (ecology) states that development can meet this element of the code by promoting the use of land that already has limited value to wildlife, and to discourage it from developing ecologically valuable sites.
South West River Basin Management Plan (Environment Agency, 2009)	The plan is prepared under the European Water Framework Directive, which requires all EU countries throughout the European Union to manage the water environment to consistent standards. Priorities for local government include ensuring that local planning document take into account the objectives of the SWRBMP, actions to reduce the physical impacts of urban development on artificial or heavily modified water bodies, promotion of the use of sustainable urban drainage systems and promote sustainable water management best practice through pre-application discussions with developers.
The Nature of Devon – A Biodiversity and Geodiversity Action Plan (Devon County Council, 2005)	Objectives of the action plan include ensuring that planning policies recognise the importance of biodiversity and the geological features of Devon, to ensure consideration is given to nature conservation issues in the implementation of planning, to reconcile the objectives of bio- and geodiversity conservation with the need for economic and social development in achieving environmental sustainability and to maintain a dialogue with relevant authorities leading to the identification of all sites of national or international geological heritage which do not benefit from SSSI status.
Devon Sustainable Community Strategy 2008-18	The natural environment of Devon needs to be sustained and should continue to be a priority for all those involved in planning for the future.
Mid Devon Green Infrastructure Plan (2013)	The Green Infrastructure Plan promotes a network of multi-functional green space with recreational, visual and biodiversity value. It identifies existing GI assets at the landscape scale and by catchment areas within Mid Devon. GIP objectives are to promote sustainable growth and economic development, to encourage health and well-being, to adapt to mitigate climate change and to improve biodiversity.

Mid Devon Playing Fields Strategy (2010)	Priority action points include: using the development of new and replacement schools as a catalyst for appraising and improving playing field facilities; to adopt and/or continue strong statutory policies protecting existing pitches, including those on education sites; and when planning new and improved facilities, to look holistically at the whole settlement's sporting provision – embracing public, private and education landowners.
Mid Devon Sustainable Community Strategy 2010-15	Mid Devon is a beautiful area with a high quality natural environment, bordering two national parks and the Blackdown Hills AONB, whilst there are also many Sites of Special Scientific Interest, county wildlife sites and local nature reserves. Development will need to be balanced against the priority of maintaining and enhancing the natural environment.
Biodiversity and green infrastructure – sustainability conclusions The biodioversity and green infrastructure plans and strategies reviewed have at heart the need to conserve and enhance biodiversity. Policies should avoid the deterioration of habitats, and look to preserve, restore and recreate priority habitats, with no net loss in priority habitats. Development should provide net gains in biodiversity where possible, balancing the economic and social needs of development with the objectives of bio- and geo-diversity conservation. Policies should also give consideration to biodiversity enhancing development. Policies should take a holistic approach to the provision of playing fields, considering all public and private landowners.	

Climate change mitigation and energy	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Climate Change Act 2008	The act sets a framework for the UK to achieve its long-term goals of reducing greenhouse gas emissions and ensures steps taken towards adapting to the impact of climate change. The act sets statutory emissions reductions targets to be achieved by 2050 and beyond. The act sets out procedures for assessing the risks of the impact of climate change and requires Government to develop an adaptation programme which contributes to sustainable development.
The Carbon Plan: Delivering our Low Carbon Future (HM Government, 2011)	The Carbon Plan sets out how the UK will achieve decarbonisation within the framework of energy policy. Within the next 10 years the plan requires the development and deployment of new technologies that will be needed to halve emissions in the 2020s. By 2050, all buildings will need to have an emissions footprint close to zero, using better insulation, energy-efficient products and having heating from low carbon sources. Manufacturing processes will need to deliver a fair share of emissions cuts. By 2050 emissions from the power sector will need to be close to zero, electricity likely being delivered by wind farms, nuclear power stations and gas and coal-fired power stations.
UK Renewable Energy Roadmap	The UK can meet a target of delivering 15% of UK's energy consumption from renewable sources by 2020. Renewable electricity has become well established, however renewable heat is less well developed. Eight technologies have the greatest potential to help

(DECC, 2011)	meet the 2020 target, these include onshore wind, offshore wind, marine energy, biomass electricity, biomass heat, ground source and air source heat pumps, and renewable transport.
UK Government Sustainable Development Strategy (2005)	The strategy for sustainable development aims to enable all people to satisfy their basic needs and enjoy a better quality of life without compromising the quality of life for future generations. The strategy sets out measure to realise the vision of sustainable communities within England, in both urban and rural areas, which will ensure the delivery of sustainable development, by placing it at the centre of the planning system.
National Planning Policy Framework (DCLG, 2012)	Planning plays a key role in helping shape places to secure radical reductions in greenhouse gas emissions, minimising vulnerability and providing resilience to the impacts of climate change, and supporting the delivery of renewable and low carbon technologies. Local authorities should adopt proactive strategies to mitigate and adapt to climate change. To support the move to a low carbon future, plan for new development in locations and ways to reduce greenhouse gas emissions; actively support energy efficiency improvements to existing buildings; set standards that are consistent with Government's zero carbon buildings policy. New development should consider the inclusion of decentralised energy supplies; take account of landform, layout, building orientation, massing and landscaping to minimise energy consumption. To increase the use and supply of renewable and low carbon energy developments all communities should contribute to their generation.
Planning practice guidance for renewable and low carbon energy (DCLG, 2013)	Increasing the amount of energy from renewable and low carbon technologies will help to make sure the UK has a secure energy supply, reduce greenhouse gas emissions to slow down climate change and stimulate investment in new jobs and businesses. Planning has an important role in the delivery of new renewable and low carbon energy infrastructure in locations where the local environmental impact is acceptable.
Planning practice guidance for onshore oil and gas (DCLG, 2013)	Oil and gas (hydrocarbons) underpin key aspects of modern society, supplying energy to power industry and heat homes, fuel for transport to carry goods and people all over the world, and raw materials to produce everyday items. Hydrocarbons remain an important part of the UK's energy mix whilst the country transitions to low carbon energy supplies. This guidance provides advice on the planning issues associated with the three phases of extraction of hydrocarbons.
Code for Sustainable Homes (DCLG, 2010)	Category 1 (energy and carbon dioxide emissions) of the code aims to limit CO_2 emissions arising from the operation of a dwelling, improving the fabric energy efficiency of dwellings, encouraging the specification of low and zero carbon energy sources, promotion of cycling and the need for cycle storage. Category 3 (materials) aims to specify the use of materials with lower environmental impacts over their life-cycle.
Devon Sustainable Community Strategy 2008-18	The county needs to reduce its carbon emissions, and incorporate necessary adaptations to manage the effects of climate change into new developments.
Climate change mitigation and energy – sustainability conclusions	
The UK is committed to achieving targets in reducing greenhouse gas emissions in order to tackle climate change. Development has a significant part to	

play to help achieve these targets for reducing carbon emissions. Planning needs to minimise vulnerability to the impacts of climate change, and support the delivery of renewable and low carbon energy development. Improving the energy efficiency of the fabric of buildings, particularly by encouraging low or zero carbon energy sources will limit CO_2 emissions.

Community and wellbeing (including equalities and health)	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Localism Act 2011	The aim of the act was to devolve more decision making powers from central government to local communities. The act contained a number of changes to the planning system, including the abolition of the regional strategies and the new 'duty to cooperate'. The act contains more rights for communities, including the community right to bid for assets of community value, community right to build, and neighbourhood planning.
Lifetime neighbourhoods (DCLG, 2011)	The report contains guidance on the design of neighbourhoods to make them inclusive regardless of age or disability. The components that make up lifetime neighbourhoods include good access (enabling residents to get out and about in the area they live), services and amenities (neighbourhoods with a mix of residential, retail and employment uses and access to services including health, post officer, banking facilities or cash machines), safe and inclusive built environments, with locally accessible greenspace and a range of affordable housing choices (based on inclusive design principles with adaptable space/layout to meet changing needs).
Laying the Foundations: A Housing Strategy for England (HM Government, 2011)	Housing and planning policies should widely positively reflect the wide range of circumstances and lifestyles of older people, who already occupy nearly a third of all homes. Planning for homes and communities where older people can remain involved with their families, friends and communities and able to choose where and how they live. New housing developments need to make suitable provision for ageing populations in the long-term, ensuring a mix of property types, including Lifetime Homes.
National Planning Policy Framework (DCLG, 2012)	Planning policies should aim to achieve places which promote opportunities for meetings between members of the community, including through mixed-use developments, strong neighbourhood centres and active street frontages; safe and accessible developments; high quality public space, which encourage the active continual use of public areas. Policies should deliver the social, recreational and cultural facilities and services the community needs, to enhance the sustainability of communities and residential environments; should guard against the unnecessary loss of valued facilities and services; ensure that local facilities can develop in a sustainable manner; and ensure an integrated approach to considering the location of housing, economic uses and community facilities and services. Local authorities should take a proactive, positive and collaborative approach to ensuring sufficient choice of school places to meet community needs. Access to high quality open spaces and opportunities for sport and

	recreation can make an important contribution to the health and well-being of communities.
Code for Sustainable Homes (DCLG, 2010)	Category 7 of the code (health and well-being) aims to provide homes that promote good daylighting thereby improving quality of life, improved sound insulation to reduce noise complaints from neighbours, provision of inclusive outdoor space which is at least partially private and construction of homes that are easily accessible and adaptable.
Devon Sustainable Community Strategy 2008-18	The strategy values diversity, using equality of opportunity for everyone as a guiding principle. Another guiding principle is the need to improve access to services and opportunities. There is a wide range in life expectancy between different communities, whilst Devon has a higher proportion of older people than the rest of the South West, with the number of older people due to reach one third of the population in the next 15 years. People will also need the opportunities to influence decision making which affects them.
Mid Devon Corporate Plan 2012-2015	'Better Homes' and 'Empowering our Communities' are objectives of the plan. Actions to meet the objectives include working with partners to provide extra care schemes in Tiverton and Cullompton, improve the most deprived areas of the district, work with partners to look at issues around rural isolation and access to services.
Mid Devon Sustainable Community Strategy 2010-15	The population of the district has grown by 20% over the last 20 years and much of this increase is down to inward migration from other parts of the UK. The largest increase is among those of retirement age, and meeting the service needs of the ageing population is a priority. There also needs to be good quality education and leisure facilities for children and young people.
Community and wellbeing – sustainability conclusions The reviewed plans and strategies set out the importance of delivering an integrated approach to new development. Building mixed inclusive communities, around a strong neighbourhood centre, with a mixture of housing, economic uses, community uses and services is a priority. Access to services, the creation of safe neighbourhoods and the availability of local greenspace and quality education and leisure facilities for young people are vital in the creation of healthy, inclusive communities. The provision of accessible, adaptable properties also allows older residents or those with disabilities to remain in their communities, close to family and friends, rather than having to move as their needs change. Residents should be able to influence decisions that affect them.	

Economy and employment	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**

The Plan for Growth (HM Treasury/BIS, 2011)	The Government's economic policy objective is to achieve strong, sustainable and balanced growth evenly shared across the country and between industries. Goals include making the UK one of the best places in Europe to start, finance and grow a business (through the implementation of a presumption in favour of sustainable development, liberalisation of use classes and guarantees on planning application decision timetable) and encouraging investment and exports as a route to a more balanced economy (including through increased investment in low carbon technologies).
The Government's Response to the Mary Portas Review (DCLG, 2012	High Streets have been left in a fragile state as people opt to visit out-of-town centres offering free parking and a range of outlets, or choose to do their shopping online. High Streets cannot rely on retail alone, and need to offer something new and different.
National Planning Policy Framework (DCLG, 2012)	The planning system should do everything it can to support sustainable economic growth, by planning proactively to meet the needs of business and support an economy fit for the 21st century. Local authorities should set out a clear economic vision and strategy for their area, and set criteria or identify strategic sites for local and inward investment to meet anticipated needs. Local authorities should also support existing business sectors, whether expanding or contracting and be flexible in accommodating needs not anticipated in the plan. Long term protection of sites not likely to come forward for employment should be avoided.
Heart of the South West Local Enterprise Partnership (LEP) Business Plan	Objectives include promoting infrastructure to connect markets. Priorities include addressing existing and future constraints on business growth (emphasising the need for ongoing public and private investment to improve connections into and within the area where current connectivity is impacting on productivity and competitiveness), encouraging the roll out of future electronic communication technologies for the region, encourage a joined up approach to future housing development to secure economic prosperity (including social infrastructure and appropriate affordable housing), ensure an integrated approach to economic development recognising the constraints the planning system can place on business growth, particularly affecting rural businesses wishing to expand.
Devon Sustainable Community Strategy 2008-18	The conditions need to be created for the county to have a strong and growing economy, ensuring maximum opportunities are available for everyone to contribute and benefit from it. There needs to be sustained investment, including in business infrastructure, communications and transport infrastructure, whilst the development of the knowledge economy should be encouraged.
Mid Devon Corporate Plan 2012-2015	'Thriving economy' is one aim of the corporate plan, in order to create a prosperous economy, sure and well-paid jobs and a sustainable environment. The aims are to increase inward investment, provide start up, relocation and expansion opportunities for businesses, provide opportunities and support to new and existing businesses and regenerate and improve the market towns.
Mid Devon Economic Development Strategy (2012)	Priorities include: increasing inward investment in the district; providing start up, relocation and expansion opportunities for businesses; provision of opportunities to support new and existing businesses; regenerating and improving the market towns; and raising skill levels, education attainment and income.

Mid Devon Sustainable Community Strategy 2010-15	The economy of the district is dominated by retail and manufacturing businesses primarily focused on the three market towns. Encouraging businesses to set up or locate within Mid Devon by providing sufficient land for development is a priority. Work needs to be undertaken with local businesses to reduce the number of empty shops in the market towns.
Economy and economic development – sustainability conclusions The planning system should support the development of strong, sustainable and balanced economic growth. Opportunities for meeting the needs of local and inward investment should be met by facilitating the growth of local businesses, both urban and rural, and providing sufficient land for employment. There should be sustained investment in business and transport infrastructure to improve connectivity. The regeneration of the market towns of the district should be supported with a particular aim to reduce the number of empty shops.	

Historic environment	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
National Heritage Protection Plan (English Heritage, 2012)	The plan seeks to ensure that England's historic environment is not needlessly at risk of damage, erosion or loss; is experienced, understood and enjoyed by local communities; contributes to sustainable and distinctive places to live and work; and helps deliver positive and sustainable economic growth.
National Planning Policy Framework (DCLG, 2012)	Local authorities should set out a positive strategy for the conservation and enjoyment of the historic environment, recognising that heritage assets are irreplaceable, and should be conserved in a manner appropriate to their significance.
Mid Devon Sustainable Community Strategy 2010-15	The district has a rich cultural heritage with many listed buildings, conservation areas and scheduled monuments. The district will need to balance development with the need to maintain and enhance the built environment.
Killerton Park Setting Study (Land Use Consultants, 2013)	The document sets out a 'zone of potential influence' around the historic park and garden which delineates its setting. The document identifies discrete areas within the setting that have a high significance to Killerton Park, and where impacts on the setting of the historic asset are most likely to occur.
Knightshayes Setting Study (The Parks	The document describes the setting for the historic park and garden, which it states extends beyond the visual envelope, and includes an assessment of the views into and out of the site and their designed or opportunist nature. The document notes that if

Agency, 2007)	the character and appearance of Knightshayes is to be preserved, it is necessary, as far as reasonable, for the setting to be protected from intrusive development, and that the effect on any development on the setting should be a material consideration in the planning process.
Historic environment – sustainability conclusions The planning system should set out a positive strategy for the conservation and protection of the historic environment, considering the value it plays in delivering sustainable, distinctive places that are enjoyed by local people. A balance needs to be struck where the priorities of maintaining and enhancing the built environment are balanced against the district's development needs. The impact on heritage assets of development should be proportionally considered in relation to their significance, with the most important nationally significant assets being given the utmost protection.	

Housing	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Laying the Foundations: A Housing Strategy for England (HM Government, 2011)	The document sets the strategy for getting the housing market moving. Priorities include increasing the supply of housing, by supporting locally planned large scale development; planning reforms to give communities more control over development, including through the Community Right to Build; stronger support for custom home building (self build); need to deliver more new affordable housing, both for rent and affordable home ownership; homes need to be well-designed, of the highest quality and environmentally sustainable; delivery of Zero Carbon Homes from 2016; new housing developments need to make suitable provision for ageing populations in the long-term, ensuring a mix of property types, including Lifetime Homes.
National Planning Policy Framework (DCLG, 2012)	The supply of housing should be significantly boosted. In order to deliver a wide choice of high quality homes, local authorities should widen opportunities for home ownership, by planning for a mix of housing basing for different groups of the community; identify the size, type, tenure and range of housing required in a location and reflecting local demand; provide affordable housing where it is needed. Housing should be located where it accords with sustainable development, and new homes within the countryside should be avoided unless there are special circumstances.
Planning policy for traveller sites (DCLG, 2012)	There should be fair and equal treatment for travellers, in a way that facilitates the traditional and nomadic way of life of travellers while respecting the interests of the settled community. Local planning authorities should work collaboratively to develop fair and effective strategies to meet need through the identification of land for sites, planning over a reasonable timescale. In doing so, the Green Belt should be protected, and plan-making should aim to reduce the number of unauthorised developments. New policies should be fair, realistic and inclusive, and should increase the number of traveller sites in appropriate locations, reducing tensions between settled and traveller communities and enabling provision of suitable accommodation from which travellers can access education, health, welfare and employment infrastructure whilst having due regard to the protection of local amenity and the

	environment.
Code for Sustainable Homes (DCLG, 2010)	The code sets nine categories of sustainable design against which new dwellings can be assessed to consider their environmental sustainability. The code sets minimum standards, which are in excess of building regulations, ranging from levels 1 to 6 (6 being the highest) against a range of criteria including energy and CO_2 emissions, water, materials, surface water run-off, waste, pollution, health and well-being, management, and ecology.
The Way We Live Now (RIBA, 2012)	Consumers in the 21st century have particular requirements within modern housing that have not always been met by housing developments in recent decades. These requirements include larger windows for natural light and higher ceilings; large main living areas for eating and socialising; layouts which take into account technology used within the home; space for private time away from other members of the household; private outside space, particularly for families, or access to green public space in urban locations; long-term and short-term storage for functional items; dedicated space for domestic utility tasks, including washing, drying and ironing clothes, as well as storing vacuum cleaners, rubbish bins and recycling; and, options for different layouts.
Devon Sustainable Community Strategy 2008-18	The shortage of affordable housing is a significant issue as average house prices are nearly 10 times average earnings in Devon. Demand for affordable housing has increased. The county will need to deliver good quality, affordable housing, with sufficient development to respond to projected growth, and include provision for the homeless and vulnerable people.
Commissioning Strategy for Extra Care Housing (Devon County Council, 2010)	Increasing numbers of people are living longer, but with more complex conditions such as dementia and chronic illnesses. By 2022 20% of the English population will be over 65, and this figure is predicted to be even higher in Devon. The provision of Extra Care Housing for older people is an important element in preventing older people from moving into residential care and increasing choice and independence. Devon intends to develop an extra care housing programme to promote the health and well being of older people who wish to live independently.
A Community Housing Strategy for Mid Devon 2010-2015	Mid Devon's housing vision is to provide good quality housing both in terms of the condition and surroundings of existing stock and the supply of new housing. Large housing waiting lists indicate the existence of a problem with the availability of affordable housing, both in the social rental sector and home owner sector. Provision of rural affordable housing is also a priority, though local opposition to such development can be an issue, though good consultation has helped the process. The plan contains an objective of locating a suitable site in Tiverton for an extra care facility.
Mid Devon Corporate Plan 2012-2015	'Better Homes' is a priority for the corporate plan. High rates of inward migration from other parts of the country have led to house price inflation, with prices now far outstripping local average wages. This situation is even further felt within the rural parts of the district. An ageing population also needs support to live in their own homes and suitably adapted accommodation. The district needs to ensure that there is sufficient decent housing for local residents and key workers who cannot afford to pay market prices.
Mid Devon Sustainable Community Strategy 2010-15	High inward migration has led to house price inflation, where prices have more than doubled in the last ten years, making them unaffordable for many in the district. There needs to be sufficient decent affordable housing for local residents and key workers. Also, people need to be able to remain in their homes longer as they get older.

Housing – sustainability conclusions
Nationally the country has not been building enough homes to house its population, and therefore significantly boosting the supply of homes is a priority. The proportion of the population of people above retirement age has increased and there is a need to provide appropriate housing in response. Providing for an ageing population or people with disabilities may need to be addressed through the delivery of homes that can be adapted as peoples circumstances change, or through the delivery of extra care housing. Wide variety of home types should be provided, across a range of tenures to meet the needs of the population. In response to the fact that house prices are nearly ten times local earnings, there is a need to provide affordable housing to address long social housing waiting lists. Such issues are also acutely felt in some of the more rural locations of the district, where house prices may be even higher, and will need to be addressed through affordable housing delivery to meet an identified need. Provision for the needs of gypsies and travellers should be made planned for which seeks to balance their locational, economic and social needs with the protection of amenity and the environment. There is a need for modern homes to be environmentally sustainable, and meets the consumer demands of the population, including provision of sufficient storage space and private outdoor space.

Infrastructure	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
National Infrastructure Plan: update 2012 (HM Treasury & Infrastructure UK)	The plan outlines the government's vision for the future of UK economic infrastructure. It sets out the challenges facing the UK infrastructure and the government's strategy for meeting the infrastructure needs of the economy containing particular commitments for investment in important infrastructure projects and plans for attracting new private sector investment. Priorities include: ensuring the road network is fit for the UK's future transport needs; protecting homes and businesses from flooding and unlocking sites for development; enabling the UK to have the fastest and best connected communications networks in Europe; investing to ensure the UK has the facilities to maintain and develop its world class research base; ensuring the security of supply and shift to a diverse, low carbon power sector; moving to a 'zero waste economy'.
Gas Generation Strategy (DECC, 2012)	Gas in an integral part of the UK's generation mix and is a reliable, flexible source of electricity. The government expects that gas will continue to play a major role in our electricity mix over the coming decades, alongside low-carbon technologies as we decarbonise our electricity system. Measures outlined in the plan are designed to ensure that: adequate gas generation capacity is available, including ensuring we maintain an appropriate capacity margin to maintain security of electricity supply; flexible plant is available to meet the intermittency associated with renewables and that the necessary gas supply infrastructure is in place to support the role of gas in generation.

National Planning Policy Framework (DCLG, 2012)	Planning policies should recognise and seek to address potential barriers to investment including a lack of infrastructure, and should identify priority areas for infrastructure provision. Local authorities should work with neighbouring and transport authorities to develop strategies for the provision of viable infrastructure necessary to support sustainable development, including large scale facilities such as rail freight interchanges, roadside facilities, and other major generators of travel demand. The provision of advanced, high quality communications infrastructure is essential for sustainable economic growth, and local plans should support the expansion of electronic communications networks. To meet the needs of local communities, planning policies should plan positively for community facilities such as local shops, meeting places, sports venues, cultural buildings, public houses and places of workshop. Policies should also take a positive, proactive approach to ensuring there is a sufficient choice of school places available to meet the needs of existing and new communities.
Infrastructure – sustainability conclusions The reviewed plans and strategies highlight the importance of delivering infrastructure to meet the needs of existing and new communities. The Government places great importance on the delivery of the following infrastructure as part of ensuring sustainable economic development: transportation, flood protection, communications, research, energy and waste. Community facilities and schools are important infrastructural elements that are required to meet the needs of local communities as part of the delivery of sustainable development.	

Land (including agricultural land, brownfield land and contaminated land)	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Safeguarding Our Soils: A Strategy for England (DEFRA, 2009)	Soil is a fundamental and essentially non-renewable natural resource, providing an essential link between the components that make up our environment. Soils vary hugely from region to region and even from field to field. Soils perform valuable functions including nutrient cycling, water regulation, carbon storage, support for biodiversity and wildlife, and providing a platform for food and fibre production and infrastructure. Soils have been degraded by human actions, and are vulnerable to erosion, compaction and loss of organic matter; such changes are likely to be exacerbated by climate change. By 2030 all England's soils will be managed sustainably and degradation threats tackled successfully. Planning decisions must take sufficient account of soil quality, particularly when significant areas of the best and most versatile agricultural land are involved. The document also considers the need for local authority officers to make proportionate and robust decisions regarding the remediation of contaminated land. Sustainable remediation that does not involve the wholesale removal and replacement of soil should be encouraged.

National Planning Policy Framework (DCLG, 2012)	The planning system should contribute and enhance the natural environment by protecting and enhancing soils. It should prevent new and existing development from contributing to or being put at unacceptable risk from, or being adversely affected by unacceptable levels of soil pollution or land instability. The planning system should, where appropriate, seek the remediation and mitigation of despoiled, degraded, derelict, contaminated and unstable land. Plans should allocate land with the least environmental or amenity value. The re-use of land that has been previously developed (brownfield) should be encouraged (provided it is not of high environmental value). The development of lower quality land should be prioritised over the best and most versatile agricultural land. Local authorities can set their own approach to determining housing densities to reflect local circumstances.
Code for Sustainable Homes (DCLG, 2010)	Category 9 (ecology) of the code aims to promote development on land that already has a limited value to wildlife and discourages the development of ecologically valuable sites. An additional aim is to promote the most efficient use of a building's footprint by ensuring that land and material use is optimised across the development.
Land – sustainability conclusions Soil is a fundamental natural resource that has been degraded by human action. Soils should be protected and enhanced. Planning should consider allocating or developing land with the least environmental value, prioritising lower quality land. Consideration of the soil quality of best and most versatile agricultural land, and the need to remediate contaminated land should be a planning consideration. When considering development, the use of land should be optimised across a site to ensure the efficient use of building footprints whilst setting a density of development appropriate to local circumstances.	

Landscape	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Countryside and Rights of Way Act 2000	Places a duty on relevant authorities in exercising their functions, to have regard to the effect on land in an AONB, and to have regard to the purpose of conserving and enhancing the natural beauty of the AONB.
National Character Areas (Natural England)	National Character Areas (NCAs) divide England into 159 distinct natural areas. Each is defined by a unique combination of landscape, biodiversity, geodiversity and cultural and economic activity. Their boundaries follow natural lines in the landscape rather than administrative boundaries, making them a good decision making framework for the natural environment.
National Planning Policy Framework (DCLG, 2012)	The planning system should contribute to and enhance the natural environment by protecting and enhancing valued landscapes. Great weight should be given to conserving landscape and scenic beauty of National Parks and Areas of Outstanding Natural Beauty, and planning permission for major development in these designated areas should be refused except in exceptional circumstances.

Devon Landscape Policy Group Advice Note No. 2: Guidance on the siting, design and assessment of wind and solar PV developments in Devon (June, 2013)	Devon is faced with a wide range of challenges arising from a changing climate. Balancing the need to support the transition to a low carbon future and the need for energy security with the management of Devon's unique and valued landscape is one of these challenges. The landscape is also a major contributor to a strong tourism industry. The conservation of special landscape character is a core principle of the NPPF. However, Devon also has good conditions to produce wind and solar electricity, but it is important that the characteristics of Devon's landscape are not unacceptably harmed by poor design or inappropriate siting of renewable or low carbon technologies.
Dartmoor National Park Authority Core Strategy (2008)	Purposes of the park are to conserve and enhance the natural beauty of the National Park, and to promote opportunities for the understanding and enjoyment of its special qualities. The core strategy sets a vision for the park, highlighting the distinctive characteristics and special qualities of Dartmoor and points to the role of planning in sustaining those qualities.
Blackdown Hills AONB Management Plan 2009-14	The plan highlights the special qualities of the AONB as the isolated, unspoilt rural area; the diversity of landscape patterns and pictures; the unique geology; and the architectural appeal. Priorities include maintaining and enhancing the features that make the landscape distinctive; the sense of tranquillity is enjoyed free from noise and visual intrusion; key wildlife sites and sites of geological importance are conserved and enhanced; key natural resources such as air, water and soils are protected and conserved; greenhouse gas emissions are reduced; sustainable agricultural practices that converse and enhance the landscape, environment, water quality and nature conservation; sustainable recreation and tourism, based on the qualities of the landscape; new development to be of the highest quality, in keeping with landscape, historic character and other special qualities; use of traditional, local materials and energy/water efficient technologies; restricting or reducing noise and light pollution; restrictions on major developments in or adjacent to the AONB; appropriate affordable housing to enable local people to remain in their communities; a sustainable rural economy that conserves and enhances landscape character; and access to appropriate local facilities, services and amenities for local communities.
Landscape – sustainability conclusions Devon has a unique and valued landscape, which also contributes towards the tourism attraction of the county. Mid Devon has borders that are adjacent or in close proximity to two national parks, whilst the Blackdown Hills Area of Outstanding Natural Beauty crosses the east part of the district. Planning policies should offer protect valued landscapes, offering protection and enhancement of the most valued landscapes such as national parks and AONBs. The protection of the landscape needs to be balanced against the challenge of mitigating the effects of climate change through the transition to a low carbon future, particularly achieved through the development of renewables technologies, which are often located in rural areas.	

Minerals	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
National Planning Policy Framework (DCLG, 2012)	Minerals are essential to support sustainable economic growth and our quality of life. It is therefore important that there is a sufficient supply of material to provide the infrastructure, buildings, energy and goods that the country needs. However, minerals represent a finite resource, and it is important to make best use of them to secure their long-term conservation.
Technical Guidance to the National Planning Policy Framework (DCLG, 2012)	The technical guidance sets out planning considerations including those to protect communities in proximity of mineral workings, control of dust and noise emissions, stability in surface mine workings, restoration and aftercare of mineral sites, and the landbanking of industrial minerals.
Code for Sustainable Homes (DCLG, 2010)	Category 3 of the code (materials) states that consideration of the environmental impact of materials can contribute to the development of sustainable homes. This part of the code aims to specify materials with lower environmental impacts over their life-cycle; to promote the specification of responsibly sourced materials for the basic building elements, as well as finishing elements.
Devon Minerals Plan 2011-2031 (Options Consultation, 2011)	Devon has minerals that are of national, and in some cases, international importance. The objectives of the document include: securing mineral development with minimal transportation by road while conserving environmental assets; making prudent use of existing resources; reinforce the distinctiveness of Devon's built environment through appropriate use of local sources of materials; safeguard mineral resources and associated infrastructure; manage mineral development in a manner that protect Devon's communities from adverse impacts and conserves the environment.
Minerals Local Plan (Devon County Council, 2004)	Objectives of the plan including: striking a balance between the demand for minerals and the need to protect the environment, having regard to sustainable development; to maintain a stock of reserves; to re-use waste minerals to reduce the requirement for new resources; to protect the County's earth science and nature conservation interest, historic environment, water environment and landscape character; to identify Mineral Working Areas; to consult with communities; and to prevent sterilisation of mineral resources by other development.
Minerals – sustainability conclusions There needs to be a sufficient supply of minerals to ensure the long-term ability to deliver infrastructure and development. The need for a supply of minerals needs to be balanced with the priority of protecting the environment. Planning for minerals extraction does not fall within the remit of Mid Devon District Council, being instead undertaken by Devon County Council. However, the consideration of the environmental impact of materials used in buildings and the desire to promote locally sourced materials is a district issue, as is the effect on local communities who are close proximity to mineral workings.	

Rural areas	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Rural Statement (DEFRA, 2012)	Rural areas are home to one-fifth of the English population, and 28% of England's businesses. The key priorities include wanting rural businesses to make a sustainable contribution to national growth; engaging directly with rural communities; wanting rural people to have fair access to public services and be actively engaged in shaping the places in which they live.
Rural Economy Growth Review (DEFRA, 2011)	Businesses in rural areas make a substantial contribution to the national economy, generating about 22% of employment. Between 2001 and 2009, the population of England's rural areas grew 10% faster than urban areas. There are strong interdependencies between market towns and their rural hinterlands. Smaller businesses play a relatively strong role in rural areas, accounting for over 50% of employment in rural areas, whilst home working rates are more than twice as high in rural than urban areas. Growth of rural businesses is restricted by broadband coverage, with 23% of rural household having no or slow connections. Populations of rural areas tend to be older than urban populations, and there are a substantially lower proportion of ethnic minority backgrounds.
Foresight. The Future of Food and Farming (Government Office for Science, 2011)	The global food system will experience an unprecedented confluence of pressures over the next 40 years. Population size will increase, raising demand, whilst competition for land, water and energy will intensify, while the effects of climate change will become increasingly apparent. Priorities for action include making sustainable food production central in development; working on the assumption there is little new land for agriculture; promoting sustainable intensification; including the environment in food system economics; reducing waste; anticipate major issues with water availability for food production and work to change consumption patterns.
National Planning Policy Framework (DCLG, 2012)	National planning policy encourages supporting economic growth in rural areas to create jobs and prosperity. This can be achieved through supporting sustainable business growth, development and diversification of agricultural activities, supporting rural tourism and retaining local services. The economic value of retaining the best and most versatile agricultural land should be considered.
Mid Devon Sustainable Community Strategy 2010-15	In a rural district, access to vital services can be a significant problem. Communities in rural areas need access to facilities and services they need. Isolated small rural communities experience issues with transport and declining services. Broadband speeds needs to be increased in rural areas.
Rural areas – sustainability conclusions The population in rural areas has grown at a greater rate than urban areas in last decade. Rural businesses make a substantial contribution to the economy and should be supported to grow. Agriculture remains an industry that has faced many challenges in recent decades and such enterprises should be supported to diversify in order to benefit the rural economy. Rural areas experience social issues such as poor access to services and facilities, whilst the growth of their economies may be hampered by poorer broadband speeds.	

Transport	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Department for Transport Priorities (gov.uk, 2013)	DfT priorities include: continuing to develop the preparations for a high speed rail network; improving existing rail network and creating new capacity; tackling congestion on roads; continuing to improve road safety; encouraging sustainable local transport; promoting lower carbon transport, such as walking and cycling; supporting the development of the market for electric and other ultra-low emission vehicles; supporting the development of aviation; and maintaining high standards of safety and security for passengers and freight.
Door to Door: A strategy for improving sustainable transport integration (DfT, 2013)	The government wants more journeys to be made by public transport, cycling and walking. The vision is for an inclusive, integrated and innovative transport system where the use of sustainable transport is made more attractive for the entire door-to-door journey. Specific actions to achieve these goals include investing in high-quality cycling and walking environment, particularly close to train and bus stations; and ensuring the future needs of society are considered at the beginning of any new developments, so that interchange facilities can be designed around expected customer needs from the outset.
Creating Growth, Cutting Carbon: making sustainable local transport happen white paper (DfT, 2011)	The document sets a vision for a transport system that is an engine for economic growth, but is also greener and safer and improves quality of life. It notes that investment on its own is not enough, as people will need to make transport choices that are good for society as a whole. Two-thirds of all journeys are less than five miles – many of which could be easily walked, cycled or undertaken on public transport. Many drivers would be willing to drive less (particularly for shorter trips), if practical alternatives were available. The report highlighted key areas which needed to be addressed to encourage more people to use sustainable travel options including: making connections between different steps in the journey, and different modes of transport, easier; and providing better interchange facilities.
National Planning Policy Framework (DCLG, 2012)	Transport policies have an important role to play in facilitating sustainable development. The transport system needs to be balanced in favour of sustainable transport modes, giving people a choice about how they travel. Different approaches will be required within different communities. Developments that generate significant movement should be located where the need to travel is minimised and the use of sustainable modes of travel maximised. Developments should exploit opportunities for sustainable development and designed to: accommodate efficient delivery of goods; give priority to pedestrian and cycle movements and have access to high quality public transport facilities; create safe and secure layouts which minimise conflicts between different transport groups; incorporate facilities for charging low emission vehicles; and consider the needs of people with disabilities.
Local Transport Plan: Devon and Torbay	Devon and Torbay's transport system will offer business, communities and individuals safe and sustainable travel choices. The transport system will help to deliver a low carbon future, a successful economy and a prosperous, healthy population living in an

Strategy 2011-2026	attractive environment. Objectives include: deliver and support new development and economic growth; making best use of transport network and protect existing transport assets; work with communities to provide safe, sustainable and low carbon transport choices; strengthen and improve the public transport network; and make Devon the 'place to be naturally active'.
Code for Sustainable Homes (DCLG, 2010)	Category 1 of the code (energy and carbon dioxide emissions) can be delivered in part by the provision of cycle storage space within new dwellings. The code states that the wider use of bicycles as transport reduces the need for short car journeys and the associated CO_2 emissions.
Transport – sustainability conclusions Reducing carbon emissions produced as a result of transportation is a national priority. This can be achieved by increasing opportunities for the use of sustainable modes of transport, such as public transport, walking and cycling; through the delivery of opportunities to increase the use of electric vehicles and improving the connections between various modes of transportation. Improve the condition of local transport network, protecting existing transportation assets. Ensure safe and sustainable transport options are available to communities.	

Waste	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Department for Communities and Local Government: Waste Priorities (gov.uk, 2013)	The main objective of government policy on waste is to protect human health and the environment by producing less waste and by using it as a resource where possible. Waste should be managed according to the 'waste hierarchy' of prevention, reuse, recycling and composting, and then using waste as a source of energy, with disposal (waste going to landfill) being a last resort. Objectives of government waste policy include: preparation of planning strategies by local authorities in which communities take more responsibility for their own waste; handling waste safely, without endangering human health and without harming the environment, and disposing of waste on one of the nearest appropriate places; assessing the suitability of waste sites, including the physical and environmental constraints on development and the cumulative effect of previous waste disposal facilities on the well-being of the local community.
Planning Policy Statement 10: Planning for Sustainable Waste Management (DCLG, 2011)	Key objectives for local authorities include: helping to deliver sustainable development through driving waste management up the waste hierarchy, addressing waste as a resource and looking to disposal as the last option, but one which must be catered for; providing a framework within which communities take more responsibility for their own waste; help implement the national waste strategy; help secure the recovery or disposal of waste without endangering human health and harming the environment; ensure the design and layout of new development supports sustainable waste management.
Updated national	Alongside the intention to have a more streamlined policy approach on waste, National policy has been revised to reflect the

waste planning policy: Planning for sustainable waste management (Consultation, July 2013)	Government's aspirations for waste management and changes made necessary due to the implementation of provisions in the Localism Act 2011. Changes include emphasising the need to increase the use of waste as a resource, placing greater emphasis on the prevention and recycling of waste, while protecting human health and the environment, as well as reflecting the principles of proximity and self-sufficiency. The policy stresses the importance of close co-operation between waste planning authorities, encourages the use of heat as an energy source where energy from waste development is being considered and removes the former reference in policy that waste planning authorities should give significant weight towards locational needs and wider environmental and economic benefits when considering waste planning applications in the Green Belt.
Waste Strategy for England (DEFRA, 2007)	Objectives of the strategy are to: decouple waste growth from economic growth and put more emphasis on prevention and re-use; meet and exceed landfill diversion targets; increase diversion from landfill of non-municipal waste and secure better integration of treatment for municipal and non-municipal waste; secure investment in infrastructure needed to divert waste from landfill; and get the most environmental benefit from that investment, through increased recycling of resources and recovery of energy from residual waste using a mix of technologies.
Code for Sustainable Homes (DCLG, 2010)	Category 5 of the code (waste) has the aim of providing adequate internal and external storage space for non-recycling waste and recyclable household waste. The code also aims to promote resource efficiency via the effective and appropriate management of construction site waste. Additional credits can be achieved by promoting the provision of compost facilities to reduce the amount of household waste sent to landfill.
Devon Sustainable Community Strategy 2008-18	Waste production will need to be reduced so that resilience on landfill is decreased, whilst the need to process waste overall is reduced, whilst recycling of all types needs to increase.
Devon Waste Plan: Preferred Options (2012)	Objectives of the plan include: playing a major role in the development of an integrated approach to waste policy, waste-related behavioural change, waste collection and infrastructure delivery; enabling waste management to supporting a sustainable economy; tackling climate change by reducing the carbon footprint of waste management; meet the needs of Devon through the delivery of new waste management infrastructure; apply the 'waste hierarchy'; support the delivery of waste facilities that use a range of technologies; achieve a reduction in negative waste management impacts on the natural, built and historic environment; and minimise the negative transport impacts of waste management. Consider four sites within Mid Devon as potential locations for recovery and/or disposal.
Devon County Waste Local Plan (2006)	The objectives of the plan are: to promote encourage communities to take more responsibility for the waste they create; to minimise any adverse effects on human health and the environment caused by the introduction of waste management facilities, and to enhance the local environment when considering plans for site restoration, after-use and aftercare; to ensure than any proposal for a waste management facility is achieved in as sustainable a manner as possible; to ensure that the management of waste is undertaken in accordance with the 'waste hierarchy' of reduction, re-use, recycling and composting, energy recovery and disposal; to encourage the provision of waste management facilities at or close to major centres of population; to ensure Devon's

	waste is treated or disposed of within the County; and to promote the establishment of an effective and integrated network of waste management facilities to serve national, regional, sub-regional and local needs.
Mid Devon Waste Strategy & Recycling Plan 2008 to 2013	Priority 1 is to reduce waste, particularly the amount of municipal waste going to landfill, increasing the 'dry' recycling rate, offering opportunities to participate in organic waste composting, and work with Devon County Council to secure provision of a Recycling Centre in the Culm Valley area.
Mid Devon Corporate Plan 2012-2015	A priority of the plan is to reduce the amount of waste going to landfill and increase recycling/composting.
Mid Devon Sustainable Community Strategy 2010-15	The district needs to reduce the amount of waste that goes to landfill.
Waste – sustainability conclusions National waste priorities are to protect human health and the environment whilst ensuring the delivery of sustainable waste management. Reducing the carbon footprint of waste will also contribute towards tackling climate change. New development should contribute to sustainable waste management, through the application of the waste hierarchy where disposal is the last resort, instead prioritising re-use, recycling or recovery.	

Water	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
European Water Framework Directive (European Commission, 2000)	The European Water Framework Directive (WFD) came into force in December 2000 and became part of UK law in December 2003. It provides an opportunity to plan and deliver a better water environment, focussing on ecology. It provides an opportunity to plan and deliver a better water environment through river basin management planning.
Flood and Water Management Act 2010	The act gives the Environment Agency a strategic overview of the management of flood and coastal erosion risk in England. It also requires upper tier authorities (locally this is Devon County Council) responsibility for preparing a strategy for managing flood risk from groundwater, surface water and other watercourses. The act places a duty on local authorities to aim to make a contribution towards the achievement of sustainable development when discharging flood management functions. The act introduces standards for the design, construction, maintenance and operation of new rainwater drainage systems, including sustainable drainage systems, and introduces an approving body (which is generally the local authority).
Water for people	The strategy sets out how the Environment Agency believes water resources should be managed to 2050 and beyond, to ensure

and the environment – Water Resources Strategy for England and Wales (Environment Agency, 2009)	that there will be enough water for people and the environment. The strategy sets out the EAs role to manage the water resources, and plan how to use them in a sustainable way. It notes that pressures on water resources are growing, given that more houses are being built, population is increasing and forecasts show we will use more water. The strategy sets out how the EA believes water resources should be managed to deliver a secure supply and safeguard the environment.
Water Resources Strategy Regional Action Plan for the South West (Environment Agency, 2009)	The action plan shows how the South West region will meet the challenges posed by pressures on water resources over the next 50 years. Actions include ensuring the water supply and demand is resilient to the effects of climate change, reducing carbon emissions associated with the supply of water, managing catchments better to protect water resources, enhancing biodiversity, reducing flood risk and improving the water efficiency of new housing and commercial developments.
National Planning Policy Framework (DCLG, 2012)	The NPPF requires local planning authorities to adopt proactive strategies to mitigate and adapt to climate change, taking full account of flood risk and water supply and demand considerations. New development should be planned to avoid increased vulnerability to the impacts arising from climate change. Local authorities should prevent new and existing development from contributing to or being put at unacceptable risk from water pollution. Local authorities should plan strategically and work with other authorities for the provision of infrastructure for water supply and flood risk. Development should be directed away from areas at highest risk of flooding. Land should be safeguarded that is required for current and future flood management. New development should reduce the causes and impacts of flooding, and should not increase flooding elsewhere.
Technical Guidance to the NPPF	The overall aim should be to steer new development to Flood Zone 1. Where there are no reasonably available sites in Flood Zone 1, local planning authorities allocating land in local plans should take into account the flood risk vulnerability of land uses, and consider reasonably available sites in Flood Zone 2. Only where there are no reasonably available sites in Flood Zones 1 or 2 should the suitability of sites in Flood Zone 3 be considered.
South West River Basin Management Plan (Environment Agency, 2009)	The plan is prepared under the European Water Framework Directive, which requires all EU countries throughout the European Union to manage the water environment to consistent standards. Priorities for local government include ensuring that local planning document take into account the objectives of the SWRBMP, actions to reduce the physical impacts of urban development on artificial or heavily modified water bodies, promotion of the use of sustainable urban drainage systems and promote sustainable water management best practice through pre-application discussions with developers.
Code for Sustainable Homes (DLCG, 2010)	Category 2 (water) of the code is mandatory, and requires a reduction of potable water in the home from all sources, through the use of water efficient fittings, appliances and water recycling systems. Category 4 (surface water run-off) is mandatory and requires the design of surface water drainage for housing developments which avoid, reduce and delay the surcharge of rainfall run-off to watercourses and public sewers using sustainable drainage techniques. This protects receiving waters from pollution and

	minimises the risk of flooding.
A Warm Response - Our Climate Change Response (Devon County Council, 2005)	A strategic objective of the plan is to adapt to climate change by 'climate-proofing' for current and future weather hazards, in particular the impact of flooding. Consideration of actions required for the maintenance or adaptation of strategic infrastructure such as the built environment, transport network and utilities.
Devon Sustainable Community Strategy 2008-18	The county will need to incorporate necessary adaptations to mitigate the effects of climate change and flooding into new development.
Mid Devon Strategic Flood Risk Assessment (2009)	Mid Devon has suffered serious flooding in the past, and the risk of flooding is likely to increase in the future as a result of climate change. With more than 7000 homes to be built in the district over the next 20 years (at the time of writing), spatial planning must take account of this risk to ensure that new development is sustainable.
Water – sustainability conclusions Managing flood risk and the effects of climate change is a key European, national and local priority, particularly as Mid Devon has suffered serious flooding in the past. There is also growing pressure on water resources and a need to improve resource efficiency. In particular new housing and commercial development should incorporate measures to improve water efficiency and reduce surface water run-off which can contribute to flooding. Water bodies should be protected from the effects of pollution, and there should be no reduction in their quality or status.

Managing Development Policies 259

Strategic Policies

Policy S1: Presumption in favour of sustainable development

The policy sets out the approach the Council will take when considering planning applications in order to deliver sustainable development.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The policy sets out that development affecting protected habitats or species, designated landscapes or Local Green Spaces should be restricted and mitigation measures sought where appropriate to achieve neutral or positive impacts.	+3
B) Protection and promotion of a quality built and historic environment	The policy sets out that development affecting designated heritage assets should be restricted and mitigation measures sought where appropriate to achieve neutral or positive impacts.	+3
C) Mitigating the effects of climate change	Sustainable development is defined as 'meeting the needs of the present without compromising the ability of future generations to meet their own needs'. As such, addressing the significant challenge of climate change works towards achieving this objective.	+3
D) Safeguarding and minimising resource use	Sustainable development is defined as 'meeting the needs of the present without compromising the ability of future generations to meet their own needs'. As such, reducing resource use, is a key element of achieving this objective.	+3
E) Promoting economic growth and employment	Economic development is one of the three strands which constitute sustainable development. This policy ensures that economic development, that is sustainable, should be approved wherever possible.	+3
F) Supporting retail	Economic development is one of the three strands which constitute sustainable development. This policy ensures that economic development, that is sustainable, should be approved wherever possible.	+3
G) Meeting housing needs	Economic development is one of the three strands which constitute sustainable development. This policy ensures that economic development, that is sustainable, should be approved wherever possible.	+3
H) Ensuring community health and wellbeing	Delivering sustainable development should ensure that communities are benefitted by proposals which improve the economic, social and environmental conditions in the area.	+3
I) Delivering the necessary infrastructure	The policy should be read in conjunction with the National Planning Policy Framework as a whole, which sets out the requirement for Local Plans to plan positively for infrastructure within their area in order to meet the objectives of the framework, including the delivery of sustainable development.	+3

Secondary/cumulative/synergistic effects:	Synergistically this policy underpins and should be read alongside all the other policies of the plan.

	Cumulatively, this policy should result in the delivery of schemes across the district which have individually met the definition of sustainable development.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The policy should result in the permanent delivery of proposals that meet the definition of 'sustainable development' as set out in the NPPF (though some proposals may only be granted temporary planning permission. The effects will be felt across the whole period of the plan.
Spatial extent: (District wide / local)	District wide and beyond

Summary of Recommendations

1. No recommendations following SA.

Policy S2: Sustainable development priorities

The Policy sets out the strategic priorities that will need to be achieved to deliver the vision and address key issues within Mid Devon to support sustainable communities.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This option has a significant positive contribution towards this objective. It aims to conserve and enhance the natural environment and valued landscapes, including the Blackdown Hills AONB and National Parks on the periphery of the district. The option aspires to encourage a net gain in biodiversity and aims to prevent unacceptable impact on the soil, air and water quality in the area and it also requires good design to conserve and enhance the natural environment and supports green infrastructure. It strengthens the existing policy which did not include a priority to conserve and enhance the natural environment.	+3
B) Protection and promotion of a quality built and historic environment	This option has a significant positive contribution towards achieving this objective. The option requires well designed development which reflects local surroundings and materials, creates safe and accessible environments and establishes a strong sense of place. The policy option also aims to conserve and enhance the historic environment through the protection of both designated and non-designated heritage assets and assessing the impact of new development on the historic character of Mid Devon's landscapes and townscapes. It strengthens the existing policy which did not include a priority to protect heritage assets or the historic character or Mid Devon.	+3
C) Mitigating the effects of climate change	This option has a significant positive contribution towards achieving this objective. It aims to meet the challenge of climate change and encourages the use and supply of renewable and low carbon energy. The option also promotes sustainable transport by reducing the need to travel by car and integrating sustainable travel such as walking and cycling, and aims to prevent unacceptable pollution levels in soil, air and water. These priorities will have a secondary effect of minimising greenhouse gas emissions. The option refers managing flood risk and sustainable design. Other policies in the plan refer the sequential approach to flood risk. This option builds on the existing policy by supporting a low carbon future and increasing the use and supply of renewable and low carbon energy.	+3

Sustainability objective	Commentary	Impact
D) Safeguarding and minimising resource use	This option has a positive impact in contributing towards achieving this objective through supporting the effective use of land and aiming to prevent unacceptable levels of soil and water pollution as well as reducing pollution through good sustainable design. The option enhances the existing adopted policy which does not prevent unacceptable pollution to soil or water. The option is silent on the management of waste however the option should be read in the context of other policies in the plan.	+2
E) Promoting economic growth and employment	The option will have a significant positive contribution on building a strong, competitive economy. It encourages access to education, training and jobs as well as the creation of new enterprise, economic regeneration and flexibility of use. The option aims to enhance and diversify the economy in general. The policy has a similar contribution to promoting the economic growth and employment of the area as the existing policy.	+3
F) Supporting retail	This option aims to ensure the vitality of town centres and will have a significant contribution towards achieving the objective to support retail. It suggests a hierarchy of centres, defined town centre shopping areas and a diverse retail offer at the three main towns (Tiverton, Crediton and Cullompton). The option supports a prosperous rural economy including through the retention and development of local services and community facilities in villages. This policy builds on the current adopted Local Plan policy which did not directly mention the importance of supporting the vitality of town centres.	+3
G) Meeting housing needs	The option promotes a delivery of a wide choice of high quality homes through a development focus at the three main towns as Mid Devon's most sustainable settlements where services and facilities are located. The option also refers to the long-term option of a new community and limited development in identified villages. In this case there may be a requirement for the provision of new services and facilities to meet the needs of the new housing development; this is however dependent on the location of the new community. The option supports the housing needs of all sectors of the community including housing for the elderly, affordable housing and gypsy and traveller pitches, this enhances the existing policy. Overall the option is likely to have a significant positive impact on meeting housing needs. However the impact on existing services and facilities is unknown as it is dependent on the location of development.	+3
H) Ensuring community health and wellbeing	The option will have a significant positive impact in contributing towards this objective. It supports walking, cycling, public transport and the provision of social recreational, sport and cultural facilities and services. The option enhances the existing policy as it aims to prevent unacceptable levels of pollution as a whole and highlights Crediton and Cullompton as areas where this is a particular local issue. Good sustainable design is required to create safe accessible environments. The option also aims to create jobs and a wide choice of high quality homes while meeting the needs of all sectors of the community which helps to reduce poverty and social exclusion.	+3
I) Delivering the necessary infrastructure	The option overall will have a positive impact on this objective. It promotes sustainable travel and supports the delivery of social, recreational, accessible green infrastructure, cultural services and facilities. The option enhances the existing policy as it supports the expansion of telecommunications and high speed broadband. The option is silent on the provision of new transport infrastructure but the option should be read in the context of the local plan as a whole. Development focus at the main towns (Tiverton, Cullompton and Crediton) contributes to making efficient use of existing infrastructure and is likely to reduce the overall need to travel. The impact of the long-term option of a new community on existing infrastructure is dependent on its location.	+2

Secondary/cumulative/synergistic effects:	This policy provides a strategic overview of sustainable development priorities in Mid Devon. It aims to meet the needs of the community and protect the natural and cultural environment. A number of issues are silent in the policy; these issues are however set out in detail by other policies in the plan which should be read as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The aims of the policy are over the lifetime of the plan. A number of impacts such as new housing development to meet the needs of the community will be permanent, whereas other effects of the policy will be dependent on market demand and may change over time, for example, economic development. The policy provides flexibility to respond to changing circumstances.
Spatial extent: (District wide / local)	The policy option aims to meet the needs across the district. Housing development is focussed at the three main towns (Tiverton, Cullompton and Crediton). The policy option also suggests the provision of a new community in the long term. The exact location of this development is not set out in the policy option but it is noted that it will be in an accessible location.

Summary of Recommendations

1. Policy S2 to include reference to 'energy efficiency', for example, re-use materials to minimise energy consumption to enhance sustainability objective C.
2. Policy S2 supporting text to clarify the policy term 'the effective use of land', for example, the protection of Greenfield land, best quality agricultural land and the reduction of derelict, degraded or underused land.
3. Policy S2 to make reference to waste management to enhance sustainability objective D.
4. To reference 'inward investment' in the supporting text in line with the Local Plan 'Vision and Objectives' to enhance sustainability objective E.
5. To include a reference in policy S2 for the provision of new infrastructure, for example, 'the provision for new infrastructure to meet the needs of new development such as roads' to enhance sustainability objective I.
6. To include a clause in policy S2 'support the social, economic and environmental regeneration of disadvantaged areas and communities'. Although this clause helps to focus the support for disadvantaged areas within the policy, the promotion of good quality housing to meet all sectors of the community and the aim to create jobs already helps to meet this intention.

Policy S3 Amount and Distribution of Development
Option 1 – Town Focus

The development needs of the community will be met through the provision of approximately 8,400 dwellings and 154,000 square metres of commercial floorspace between 1 April 2013 and 31 March 2033. Option continues to concentrated development at Tiverton, Cullompton and Crediton, to a scale and mix

appropriate to their individual infrastructures, economies, character and constraints. Rural Areas will have more limited development which meets local needs and promotes vibrant rural communities.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	By focusing new development at the main towns this strategy will protect biodiversity and landscape character in the rest of Mid Devon, a positive effect. Development opportunities at Tiverton and Crediton and constrained by topography and the potential for landscape impact, a negative effect. To policy acknowledges that development will be to a scale and mix appropriate to their individual infrastructures, economies, character and constraints. This option accords with the aspirations of the NPPF to prevent isolated new homes and to protect and enhance valued landscapes. There may also be opportunities for enhancement of landscape character and biodiversity, but this is likely to be on an individual site basis. On balance a neutral score is considered to reflect the policy aspirations.	0
B) Protection and promotion of a quality built and historic environment	New development in towns and villages has the potential to have a negative impact on the historic environment located in and around these settlements. There may however be some opportunities for a positive effect through enhancement of heritage assets and local distinctiveness, but this is likely to be on an individual site basis. On balance this option is considered to have no effect. The protection of the historic environment is justified in policies elsewhere in the plan.	0
C) Mitigating the effects of climate change	By focusing new build development in the settlements where jobs and services are located the option will reduce the need to travel and therefore reduce greenhouse gas emissions. There is also potential for the provision of low carbon and renewable energy as part of larger development in and around the main towns. This option is considered to have a positive effect towards climate change mitigation. Where some settlements are vulnerable to flood risk, new development would be subject to safeguards in policies, with levels of development dependent on the capacity of the settlement and available suitable land. There may be some opportunities for flood mitigation and promotion of low carbon and renewable energy measures, but this is likely to be on an individual site basis, for example through design. The protection against flood risk and provision of renewable energy policy is justified in policies elsewhere in the plan.	+2
D) Safeguarding and minimising resource use	Option scores positively towards safeguarding and minimising resource use as it focuses new development in the main towns and makes use of brownfield land to reduce the need for greenfield development. There could be some loss of the best and most versatile agricultural land around some settlements, a negative effect, although this is not likely to be significant. The provision of approximately 8,400 dwellings and 154,000 sqm commercial floorspace will contribute to waste levels. New development will add to waste water levels however the option considers environmental capacity. On balance this option is considered to have no effect. There may be some opportunities for resource-efficient design and/or construction following the principles of the waste hierarchy.	0
E) Promoting economic growth and employment	This option takes forward the Core Strategy development strategy by directing development to the existing main towns of Mid Devon until 2033. This option will have a significant positive effect as it increases jobs and reduces out commuting by focusing commercial floorspace at existing main towns and settlements. The option also supports rural business by providing commercial floor space in villages. This option will help meet the employment needs of the district and enhance the economy in general while encouraging inward investment and future prosperity. The main towns have good connection to the strategic road network for storage and distribution uses.	+3
F) Supporting retail	Focusing development in the main towns and larger villages will support the vitality and viability of existing town centres and shopping facilities in the larger villages. Although the option suggests retail provision could be provided this is not	+1

	outlined as a policy requirement. Given the uncertainty the policy has only a slight positive effect.	
G) Meeting housing needs	This option takes forward the Core Strategy development strategy by directing development to the existing main towns of Mid Devon until 2033. The strategic option provides for approximately 8,400 dwellings across the district to meet the anticipated housing needs target for the district, a significant positive effect. Housing is concentrated at the main towns where existing services and facilities are located, a further positive effect. The policy option allows for a scale and mix of development to help contribute to balanced communities. The percentage of affordable housing provision is justified in other policies within the plan.	+3
H) Ensuring community health and wellbeing	Focusing development at the main towns and villages will result in the majority of new development having access to community facilities, open space and recreation available within existing settlements, a significant positive effect. Option focuses development towards Crediton and Cullompton which are designated air quality management areas, a negative effect. There may be some opportunities for mitigation measures, on a town wide basis. For example through new road layout / relief road and /or walking and cycling. Development is focused away from Exmoor National Park an international dark sky reserve, a positive effect. Walking, cycling and public transport are encouraged through proximity of development to town centres and other key services, a further positive effect. The mix of development will contribute to reducing social exclusion. Policy option supports limited development which meets local needs and promotes vibrant rural communities. On balance a significant positive effect.	+3
I) Delivering the necessary infrastructure	Option contributes towards the efficient use of existing infrastructure by focusing growth in the main towns, reducing the need to travel, a positive effect. The policy option considers infrastructure capacity. The provision of infrastructure is justified in policies elsewhere in the plan.	+2

Secondary/cumulative/synergistic effects:	A number of mitigation measures are suggested which are covered by other policies in the plan. The Local Plan should be read as a whole and would mitigate against the sustainability issues which cross-reference across the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option meets the housing and commercial needs for the district and the three main towns of Tiverton, Cullompton and Crediton. Policy option enables the distribution of development across the district to meet local needs.

Summary of Recommendations

1. Policy S3 to clarify definition of 'Commercial Floor Space' to specifically reference retail development.
2. Policy S3 to cross reference affordable housing policy S4.

Option 2 – New Community

The development needs of the community will be met through the provision of approximately 8,400 dwellings and 154,000 square metres of commercial floorspace between 1 April 2013 and 31 March 2033. Option concentrates development at Tiverton, Cullompton and Crediton to a scale and mix appropriate to their individual infrastructures, economies, characters and constraints with additional strategic growth being directed to a new community with close connections to the M5 Motorway. Rural Areas will have more limited development which meets local needs and promotes vibrant rural communities.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	By focusing new development at the main towns and a new community this strategy will continue to protect the rural biodiversity and landscape character in the rest of Mid Devon, a positive effect. A new community will likely however have a positive impact on the landscape as there will be substantial development opportunities in the open countryside away from areas of the highest landscape value. There may however be opportunities for enhancement of landscape character and biodiversity in the towns, but this is likely to be on an individual site basis and not applicable to a new settlement. Instead biodiversity off-setting maybe more appropriate.	-1
B) Protection and promotion of a quality built and historic environment	New development in towns and villages may have the potential to impact on the historic environment located in and around these settlements. There may be some opportunities for enhancement of heritage assets and local distinctiveness, but this is likely to be on an individual site basis. A new community is likely to have less impact on the existing built environment as it will be further from the existing towns and villages; however this will be subject to individual site location. On balance this option is considered to have no effect. The protection of the historic environment is justified in policies elsewhere in the plan.	0
C) Mitigating the effects of climate change	By focusing new build development in the settlements where jobs and services are located the option will reduce the need to travel and therefore reduce greenhouse gas emissions. There is potential for the provision of low carbon and renewable energy as part of a new community or as part of larger development in and around the main towns or new community. This option is considered to have a positive effect towards climate change mitigation. Where some settlements are vulnerable to flood risk, new development would be subject to safeguards in policies, and levels of development will be dependent on the capacity of the settlement and available suitable land. There may be some opportunities for flood mitigation and promotion of low carbon and renewable energy measures, but this is likely to be on an individual site basis, for example through design. The impact of a new community on flood risk and its vulnerability and the opportunities available for walking and cycling is uncertain as this is dependent on its location. The protection against flood risk and provision of renewable energy policy is justified in policies elsewhere in the plan.	+2
D) Safeguarding and minimising resource use	This option scores positively towards safeguarding and minimising resource use as it direct some new development in the main towns and makes use of brownfield land to reduce the need for greenfield development. The new community proposed is however likely to be entirely greenfield. There could be some loss of the best and most versatile agricultural land around some settlements, a negative effect, although this is not likely to be significant. The provision of approximately 8,400 dwellings and 154,000 sqm commercial floorspace will contribute to waste levels. New development will add to waste water levels however the option considers environmental capacity. On balance his option is therefore considered to have a negative effect. There may be some opportunities for resource-efficient design and/or construction following the principles of the waste hierarchy.	-1

Sustainability objective	Commentary	Impact
E) Promoting economic growth and employment	This option diverges from the Core Strategy development strategy by directing future growth away from the main towns and towards a new community with close connections to the M5 motorway. Option scores positively as it focuses some development in the existing towns and villages which increases jobs and reduces out commuting through the provision of commercial floorspace in these settlements. Option supports rural business by providing commercial floor space in villages. The new community will add to the provision of commercial floorspace in the district as a whole but may direct some economic growth away from the existing towns and villages, a negative effect. The new community may also encourage greater travel however this is dependent on its location. A new community has the potential to encourage larger investment and economic development. The Employment Land Review however encourages small scale employment sites to cover the needs of the district. The option will encourage inward investment and future prosperity. On balance this option is considered to have a slight positive effect.	+1
F) Supporting retail	Focusing development in the main towns and larger villages will support the vitality and viability of existing town centres and shopping facilities in the larger villages. A new community provides the potential for encouraging larger investment and economic development however this could direct some retail away from the main towns and villages, a negative effect, the level of impact is however dependent its location. Although the option suggests retail provision could be provided this is not outlined as a policy requirement. Given the uncertainty the policy has only a slight positive effect.	+1
G) Meeting housing needs	This option diverges from the Core Strategy development strategy by directing future growth away from the main towns and towards a new community with close connections to the M5 motorway. Option provides for 8,400 dwellings across the district to meet the anticipated housing need target for the district, a significant positive effect. The policy option allows for a scale and mix of development to help contribute to balanced communities. Some housing is directed to the main towns where existing services and facilities are located. The new community would help meet the housing needs of the district however key services and facilities would need to be provided. The percentage of affordable housing provision is justified in other policies within the plan.	+3
H) Ensuring community health and wellbeing	Development at the main towns will result in some new development having access to community facilities, open space and recreation within existing settlements, a significant positive effect. New services, facilities and walking, cycling and public transport links may need to be provided in a new community dependent on location. Development at Crediton and Cullompton may affect the designated air quality management areas resulting in a slight negative effect. There may be some opportunities for mitigation measures on a town wide basis, for example through new road layout / relief road and /or walking and cycling. Development in the main towns is located away from Exmoor National Park an international dark sky reserve, a positive effect. Walking, cycling and public transport are encouraged through proximity of some development at town centres and other key services, a further positive effect. The mix of development will contribute to reducing social exclusion. Policy option supports limited development which meets local needs and promotes vibrant rural communities.	+2
I) Delivering the necessary infrastructure	Option contributes towards the efficient use of existing infrastructure by directing some growth to the main towns, reducing the need to travel, a positive effect. The new community may encourage greater travel however this is dependent on location. The policy option considers infrastructure capacity. The provision of infrastructure is justified in policies elsewhere in the plan.	+2

Secondary/cumulative/synergistic effects:	A number of mitigation measures are suggested which are covered by other policies in the plan. The Local Plan should be read as a whole and would mitigate against the sustainability issues which cross-reference across the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option meets the housing and commercial needs for the district. Policy option enables some distribution of development across the district with a focus on a new community.

Summary of Recommendations

1. Policy S3 to clarify definition of 'Commercial Floor Space' to specifically reference retail development.
2. Policy S3 to cross reference affordable housing policy S4.

Policy S4: Meeting Housing Needs

Policy S4 outlines the District's diverse housing needs including the provision of 8,400 dwellings between 1 April 2013 and 31 March 2033, thresholds for seeking 35% affordable housing in towns and rural localities, that 20% of new housing should be designed for elderly occupants and the five year supply of gypsy and traveller pitches.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Similar to the existing policy, the level of impact on this objective will be dependent on individual proposals. The policy option should however be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes and designated biodiversity and geodiversity sites are conserved.	0
B) Protection and promotion of a quality built and historic environment	Similar to the existing policy, this option will have some positive and some negative impacts in contributing to this objective depending on each individual proposal. The policy option should be considered in the context of other policies which aim to protect heritage assets and which promote high quality design which supports the positive contribution of new development to local character.	0
C) Mitigating the effects of climate change	The construction of new homes and catering for a greater population can increase carbon emissions; however there may be opportunities by meeting housing needs to enhance features such as walking and cycling provision for the community as a whole. Opportunities to reduce flood risk; promote low carbon or renewable energy and create low carbon buildings also arise. Similar to the existing policy this option may have some positive and some negative impacts in contributing to this objective depending on each individual proposal. The policy option should be considered in the context of other policies such as sustainable design.	0
D) Safeguarding and	Similar to the existing policy this option may have some positive and some negative impacts on this objective, this is	0

Sustainability objective	Commentary	Impact
minimising resource use	however dependent on each individual proposal and should be read in the context of other policies in the plan, for example sustainable design.	
E) Promoting economic growth and employment	The policy option does not proactively aim to promote economic growth and employment; however by meeting housing needs of Mid Devon it may encourage inward investment. Conversely meeting the housing needs of the community does not guarantee increased jobs or reduced out-commuting. This policy option takes a similar approach as the existing policy. The level of impact on this objective is unknown.	0
F) Supporting retail	The impact of this option on this objective is unknown. The policy option does not proactively aim to support retail, however by meeting the diverse housing needs of Mid Devon could help support retail in local areas although this cannot be directly connected to be as a result of this option. This option takes a similar approach as the existing policy.	0
G) Meeting housing needs	This option will have a significant positive contribution towards achieving this objective. The key purpose of this option is to meet the housing needs of the district. The policy option meets the housing needs target of 8,400 and promotes balanced communities by encouraging an appropriate mix of housing such as affordable housing, housing designed for the elderly and gypsy and traveller pitches. The impact of this policy option on existing services and facilities is unknown as this will be on a site by site basis. This option should however be read in the context of other policies in the plan which aim to meet the demand for services and facilities of the community. This policy option enhances the existing policy in the Local Plan through updating the level of housing need for the district up to 2033 and strengthening the focus on the range of housing needs in the district. It also updates the target for affordable housing in line with recent viability assessment work.	+3
H) Ensuring community health and wellbeing	The option helps to reduce barriers to housing by meeting the diverse housing needs of the district and is therefore likely to have at least a minor positive contribution to this objective. Similar to the existing policy the option does not however proactively aim to meet the variety of indices in this option. The impact on the provision of open space, limiting air, noise and light pollution and promoting safe and secure environments is unknown. The option should however be read in the context of other policies which support community health and wellbeing.	+1
I) Delivering the necessary infrastructure	This policy option could have some positive or some negative impacts on delivering the necessary infrastructure. The level of impact will be on a site by site basis. The policy option should read in the context of other policies which aim to deliver the necessary infrastructure. This policy option takes a similar approach as the existing policy. Any proposals will also have to abide to the infrastructure policy in the plan.	0

Secondary/cumulative/synergistic effects:	The impact of this policy option will be dependent on the scale and location of individual proposals.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option aims to meet the housing needs across the district.

Summary of Recommendations

1. To make reference to the infrastructure policy in the Local Plan.

Policy S5: Ensuring housing delivery

The policy sets out the mechanism that will allow further sites to come forward if for any reason the expected level of delivery falls significantly below the annual target set out in Policy S4.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The level of impact of this option on the natural environment will be dependent on the site location and individual proposals for exception sites. The policy option should be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes and designated biodiversity and geodiversity sites are conserved.	0
B) Protection and promotion of a quality built and historic environment	The impact of this option on the quality of the built and historic environment is unknown as the level of impact will be dependent on the site location and individual proposals for exception sites. The policy option should be considered in the context of other policies which aim to protect heritage assets and which promote high quality design which supports the positive contribution of new development to local character.	0
C) Mitigating the effects of climate change	The impact of this option on the potential to mitigate the effects of climate change is unknown as the level of impact will be dependent on individual proposals where exception sites are permitted. The policy option should be considered in the context of other policies such as sustainable design.	0
D) Safeguarding and minimising resource use	The impact of this option on resources is unknown as the level of impact will be dependent on individual proposals where exception sites are permitted. The policy option should be considered in the context of other policies in the plan such as sustainable design and waste management.	0
E) Promoting economic growth and employment	The impact of this policy option on this objective is unknown. The policy option does not proactively aim to promote economic growth and employment; however by providing a tool to ensure housing delivery is met by meeting the housing needs of Mid Devon it may encourage inward investment. Conversely meeting the housing needs of the community does not guarantee increased jobs or reduced out-commuting.	0
F) Supporting retail	The impact of this policy option on this objective is unknown. The policy option does not proactively aim to support retail; however by providing a tool to ensure housing delivery is met by meeting the housing needs of Mid Devon it could help support retail in local areas, although this cannot be directly connected to be as a result of this option.	0
G) Meeting housing needs	This option will have a significant positive contribution towards achieving this objective by supporting 'Policy S4 Meeting Housing Needs'. The policy option enables a tool to ensure housing delivery to meet the target set out under Policy S4. This option enhances the existing plan by providing a strategic policy to ensure housing delivery.	+3

Sustainability objective	Commentary	Impact
H) Ensuring community health and wellbeing	This policy option does not proactively aim to meet the variety of indices in this option, for example, its impact on the provision of open space, limiting air, noise and light pollution and promoting safe and secure environments is unknown. However the option supports 'Policy S4 Meeting Housing Needs' to ensure housing delivery throughout the lifetime of the plan. By providing a tool to ensure housing delivery across the district, the provision of a wide range of housing as outlined in S4 will help reduce barriers to housing and is therefore likely to have at least a minor positive contribution to this objective.	+1
I) Delivering the necessary infrastructure	This policy option does not proactively aim to deliver necessary infrastructure. The level of impact on the existing infrastructure is unknown as this will be dependent on site location and individual proposals. The policy option should read in the context of other policies which aim to deliver the necessary infrastructure.	0

Secondary/cumulative/synergistic effects:	The secondary and cumulative impact of this policy option will be dependent on the scale and location of individual proposals.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option aims to ensure housing delivery across the district.

Summary of Recommendations

1. No recommendations following SA

Policy S6 Public Open Space
Option 1 – Update Policy

Option deviates from Allocations and Infrastructure DPD by requiring new housing developments to provide levels of on-site public open space equating to National Playing Fields Association (NPFA) 'Six Acre standard'. For smaller developers the Council will utilise CIL, with the exception of where developers offer contributions greater than CIL payment.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Option has a positive effect, as the provision of public open space in new development can contribute to green infrastructure and the creation of wildlife corridors within built development. In-site open space can also be used to break	+2

	up the built form of development and protection of valued landscapes.	
B) Protection and promotion of a quality built and historic environment	Open space within new development can be strategically located to enhance the townscape and reinforce local distinctiveness, a positive effect.	+2
C) Mitigating the effects of climate change	No impact.	0
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option has a slight negative effect by reducing housing density and increasing the costs of development, thereby reducing the overall supply of housing.	-1
H) Ensuring community health and wellbeing	Option has a significant positive effect for communities by increasing the access to open space and recreation development either directly on-site or off site through CIL contributions. The Council is preparing an Open Space and Play Area Strategy to deliver new facilities and has undertaken a green infrastructure Assessment to determine the level of supply across the district. Existing public open spaces are protected from development by policies elsewhere in this plan, and communities may also seek to protect them by seeking their designation as local green spaces, registering them as Assets of Community Value or through protection in a Neighbourhood Plan.	+3
I) Delivering the necessary infrastructure	The provision of public open space in new development can contribute to green infrastructure provision, a positive effect.	+2

Secondary/cumulative/synergistic effects:	The cumulative effect of planning obligations / CIL is considered through an assessment of Plan wide viability and is not considered overly burdensome to prevent most new housing development.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Public open space is not considered to have a permanent effect on the environment.
Spatial extent: (District wide / local)	Policy option will contribute toward the open space needs for the district and will be concentrated where new development is delivered.

Summary of Recommendations

1. No recommendations following SA

Policy S7: Employment

The policy sets out the employment needs of the community through the development of 154,000 square metres of commercial floorspace comprising a range of employment generating uses; Office, industry storage and distribution, retail tourism and leisure development for healthcare, education and public facilities and other forms of sustainable employment generating uses.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The level of impact of this option on the natural environment will be dependent on site location and individual proposals. The option should be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes and designated biodiversity and geodiversity sites are conserved.	0
B) Protection and promotion of a quality built and historic environment	The level of impact of this option on the built and historic environment is unknown as this will be dependent on each individual proposal. The option should be considered in the context of other policies which aim to protect heritage assets and which promote high quality design.	0
C) Mitigating the effects of climate change	The impact of this option on this objective is unknown. Opportunities may arise to help mitigate against the effects of climate change however this is dependent on each individual proposal. The policy option should be considered in the context of other policies such as sustainable design.	0
D) Safeguarding and minimising resource use	The impact of this option on this objective is unknown. Opportunities may arise to help minimise resource use however this is dependent on each individual proposal. The policy option should be considered in the context of other policies such as sustainable design.	0
E) Promoting economic growth and employment	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this option is to meet the employment needs of the community. The policy option differs from the existing policy in the current plan, it reduces the amount of employment land proposed in line with up-to-date economic evidence which improves the viability of sites. It also increases flexibility in the type of employment generating uses by introducing a wider range of use classes in comparison to the existing policy. It promotes uses that provide jobs which will help enhance and diversify the economy.	+3
F) Supporting retail	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this option is to meet the employment needs of the community which can include the provision of retail development. In providing the opportunity for retail development, this policy option will help enhance the vitality and viability of town centres and rural shopping. The policy differs from the existing policy by providing flexibility of uses to meet the overall commercial floorspace, whereas the existing policy set aside 10,000m2 to be met by retail floorspace. As it is noted in the supporting text that forecasting retail demand is not very reliable, this flexible approach allows retail development to respond to	+3

Sustainability objective	Commentary	Impact
	market demand.	
G) Meeting housing needs	This option will have a minor positive contribution to meeting housing needs. The option does not proactively aim to meet housing needs such as the supply or mix of housing however by providing for commercial floor space across the district this could help improve access to local services and facilities for local communities. The option enhances the existing policy as it broadens the potential use classes which will be promoted by the policy, including development for healthcare, education and public facilities.	+1
H) Ensuring community health and wellbeing	This option will have a positive contribution to ensuring community health and wellbeing. The option strengthens the existing policy by encouraging healthcare, education and public facilities. The option supports development for community facilities and should help reduce social deprivation through the creation of jobs. However the impact of the option on features such as open space, sustainable forms of travel and pollution are unknown but should be read in the context of the local plan as a whole.	+2
I) Delivering the necessary infrastructure	This option could have some positive or some negative impacts on delivering the necessary infrastructure. The level of impact will be dependent on the site location and individual proposals. The option should read in the context of other policies which aim to deliver the necessary infrastructure. This option takes a similar approach as the existing.	0

Secondary/cumulative/synergistic effects:	The impact of this option will be dependent on the scale and location of individual proposals.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the development will be permanent but the use class of the development may change over time depending on market demand.
Spatial extent: (District wide / local)	Policy option aims to meet the employment needs across the district.

Summary of Recommendations

1. Policy S7 to make reference to ‘protecting countryside character’ to enhance sustainability objective A.
2. Policy S7 to reference ‘measures to diversity the agricultural and rural economy’. Although it is not prescribed in the policy option clause ‘d’ is likely to encompass these forms of development and this recommendation therefore will not enhance the sustainability appraisal score.
3. Cross-reference ‘Amount and distribution if development’ and ‘Infrastructure’ policies to enhance sustainability objective I.

Policy S8 Town Centres
Option 1 – Update Policy

The vitality and viability of the town centres of Tiverton, Cullompton and Crediton will be protected and enhanced by positive management so that economic regeneration and heritage conservation reinforce each other. Option deviates from the Core Strategy by proposing to revise Bampton's status to that of the larger villages, so it will not have a town centre boundary.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	No impact.	0
B) Protection and promotion of a quality built and historic environment	Option has a positive effect by protecting and enhancing the town centres of Tiverton, Cullompton and Crediton so that regeneration and heritage reinforce one another. Option supports town centre uses that are well designed a further positive effect.	+2
C) Mitigating the effects of climate change	Through a town centre focus, the option has a positive effect on walking, cycling and public transport.	+2
D) Safeguarding and minimising resource use	The option has a positive effect, by encourages economic regeneration of town centre locations optimising the use of previously developed land and reducing the amount of derelict / underused land.	+2
E) Promoting economic growth and employment	The central aim of the option is to protect and enhance the vitality and viability of the town centres of Tiverton, Crediton and Cullompton to support economic regeneration. Through enhancement and regeneration this option will have a positive effect on economic growth and employment.	+2
F) Supporting retail	The vitality and viability of the town centres of Tiverton, Crediton and Cullompton will be supported through this policy, a significant positive effect. The option deviates from the Core Strategy by removing Bampton's status and changing it to that of the larger villages, so that it will no-longer have a town centre boundary. The Retail Study suggests that a changing role or focus for town centres may be required, involving conversion and redevelopment to other uses. The policy therefore has a positive effect in supporting retail by promoting new houses, shops, leisure and offices as well as other key town centre uses in town centre locations or outside of town centres in sequentially preferable locations. The sequential test is set out in full elsewhere in the plan.	+3
G) Meeting housing needs	Town centre redevelopment is expected to include some residential accommodation, to improve the viability of development and the vitality of the town centre, a positive effect.	+2
H) Ensuring community health and wellbeing	The option directs town centre uses to sequentially preferable locations and improve opportunities for walking and cycling, a slight positive effect. The option will also contribute towards measures to enhance and improve community uses, a further positive effect.	+1
I) Delivering the necessary infrastructure	The policy option requires traffic management measures to improve the environment and accessibility, a positive effect.	+2

Secondary/cumulative/synergistic effects:	The policy option should be considered alongside the retail sequential test. The Local Plan should be read as a whole
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	The policy applies district wide by focus new housing, retail development and other town centre uses into the districts three main town centres with proposals outside these locations considered through the Plans sequential test.

Summary of Recommendations

1. Policy S8 to reference retail, leisure and office development as well as other key town centre uses as an option within the proposed new community at Junction 27 as an exception to the town centre first policy or provide the proposed new community with a town centre boundary.

Policy S9: Infrastructure

The Council will work with providers and developers to ensure new development is served by the necessary infrastructure in a predictable, timely and effective fashion. The policy sets out key infrastructure and facilities required for new development in an infrastructure plan taking account of existing provision and cumulative impact and seeks financial contributions towards improved infrastructure from developers.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This option has the potential to negatively impact on this objective as the principle of this development is to ensure development is served by infrastructure which can include large scale man-made development although it does take into account the cumulative impact. The policy option enhances the existing policy option as it promotes sustainable modes of transport, however overall the policy option does not set out significant mitigation measures to protect the natural environment. The policy option should however be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes and designated biodiversity and geodiversity sites are conserved.	-2
B) Protection and promotion of a quality built and historic environment	Infrastructure development can involve large man-made development such as roads which can negatively impact on the built and historic environment such as listed buildings, conservation areas and archaeology. In some cases a negative impact of infrastructure on this objective cannot be completely mediated due to the nature of the development and the requirement for its location. Overall the option does not set out significant mitigation measures to protect the built and historic environment, however the nature of the type of development can help contribute to the improve safety in the built environment and cumulative impacts are considered in the option. Opportunities to enhance the built environment may also arise. The option therefore will have some positive and some negative impacts in contributing to this objective.	0

Sustainability objective	Commentary	Impact
	The option should be considered in the context of other policies in the plan which aim to protect heritage assets and which promote high quality design.	
C) Mitigating the effects of climate change	The provision of infrastructure such as roads can encourage greater use of the car however the option enhances the existing policy by promoting the use of sustainable modes of transport which will help reduce carbon emissions. Although not set out explicitly, the option also enables the provision the infrastructure to reduce flood risk and promote low carbon or renewable energy. New development can also be guided to locations where its infrastructure will help to achieve wider planning objectives such as air quality improvements. Overall this policy option is likely to have a positive impact towards achieving this objective.	+2
D) Safeguarding and minimising resource use	The impact of this option on resources such as water quality and versatile agricultural land is unknown as this will be site specific. The option provides some opportunities to support this objective through enabling infrastructure, for example, to manage waste or protect water quality. The option also considers the cumulative impact of development. Similar to the existing policy, there is potential for this option to have both positive and negative impacts on this objective.	0
E) Promoting economic growth and employment	This option enables the provision of new infrastructure where required. It states that new development will be served by necessary infrastructure in a predictable, timely and effective fashion; this in turn can help to serve the economic growth and employment of the district by providing good transport links and necessary infrastructure to attract economic development into the district. Similar to the existing policy the option does not proactively aim to promote this objective however it is likely to have at least a minor positive impact in promoting economic growth and employment.	+1
F) Supporting retail	This option enables the provision of new infrastructure where required. It states that new development will be served by necessary infrastructure in a predictable, timely and effective fashion; this in turn can help to serve the support retail in the district. The option is likely to have at least a minor positive impact in contributing towards achieving the objective. Similar to the existing policy, the option is not set out to support retail development and therefore the potential for enhancing the vitality and viability of the town centre or rural shopping is unknown.	+1
G) Meeting housing needs	This option does not directly add to the supply of housing, or affect the size and mix of housing and therefore won't significantly contribute to this objective. However the option states that new infrastructure development will be guided by the need for community facilities and any existing shortages, the option will therefore help minimise pressure of existing and improve access to services and community facilities. Similar to the existing policy it will have at least a minor positive impact in achieving this objective.	+1
H) Ensuring community health and wellbeing	The option is guided by the need for community facilities and existing shortages. This option enhances the existing policy by promoting improvements to accessibility for the whole community and sustainable modes of transport. There is also the possibility that new development can be guided to locations where its infrastructure will help to achieve wide planning objectives such as air quality improvements. The impact of this option on some features of this objective such as pollution levels will be dependent on the development proposed. Overall this option will have a positive impact on achieving this objective.	+2
I) Delivering the necessary	The key purpose of this option is to help deliver the necessary infrastructure in the district. It is guided by the need for community facilities and any existing shortages and therefore aims to minimise pressure on existing infrastructure. By not categorising types of infrastructure, the policy option ensures that a flexible approach is taken to deliver the wide range of	+3

Sustainability objective	Commentary	Impact
infrastructure	infrastructure required, for example, roads, green infrastructure and telecommunications.	

Secondary/cumulative/synergistic effects:	The policy option takes into account the cumulative impact of new development and enables infrastructure development to meet the needs of existing and future communities.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect can be permanent, for example, the creation of a new road. Provision for other development such as schools may change over time. In the short term, particularly for large scale infrastructure development carbon emissions could be increased during the construction stage however depending on the individual proposal, the longer term impact could benefit carbon emissions overall.
Spatial extent: (District wide / local)	The policy option aims to meet the needs of the community across the district.

Summary of Recommendations

1. Policy S9 supporting text to note the importance of protecting the natural environment and cross-reference policies in the plan that protect the natural environment to enhance sustainability objective A.
2. Policy S9 to set out the importance of protecting and enhancing the built and historic environment, this could include a cross-reference to policies in the plan that set out criteria to enhance the built and historic environment to enhance sustainability objective B.

Policy S10 Environment
Option 1 – Update Policy

New development will be located, designed and constructed in ways that reinforce local distinctiveness, respond to climate charge and provide positive solutions for protecting and enhancing environmental assets. Option deviates from Core Strategy by combining criteria from policies on Local Distinctiveness, Flooding and Climate change.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The option will have a significant positive effect through the preservation and enhancement of the distinctive qualities of Mid Devon's natural landscape and by supporting opportunities within landscape character. Renewable energy development will also be expected to be located in areas of acceptable landscape and wildlife impact, balanced with the wider sustainability benefits of renewable energy. The policy option has the primary objective of protecting the special	+3

	environmental qualities of the landscape setting including within the Blackdown Hills AONB and locations on the edge of AONBs or Dartmoor or Exmoor National Parks. The policy criteria seek the protection and enhancement of designated sites of national and local biodiversity and geodiversity importance, a positive effect. On both designated and undesignated site development will also be expected to protect species populations and linking habitats. The policy should be considered in the context of other policies within the plan including those on landscape and green infrastructure.	
B) Protection and promotion of a quality built and historic environment	The option is considered to have a significant positive effect on the protection and promotion of the built environment through the implementation of high quality sustainable design which reinforces the character and distinctiveness of Mid Devon's built environment and also through the preservation and enhancement of Mid Devon's cultural and historic environment.	+3
C) Mitigating the effects of climate change	The aim of the policy is to minimise the impact of development on climate change. This option will have a significant positive effect on climate through the implementation of high quality sustainable design which mitigates and adapts to climate change. The policy option however restricts renewable energy development to locations only where there is an acceptable local impact, including criteria on visual, nearby residents, landscape character and wildlife. Given the scope of restrictions this policy may have a negative effect depending on how the policy is interpreted. The policy also includes measures to reduce the risk of flooding by guiding development to locations of lowest flood risk by applying a sequential test. On balance a positive effect is considered to occur.	+2
D) Safeguarding and minimising resource use	The option is considered to have a significant positive effect by setting out a range of criteria to minimise resource use. The policy option seeks to minimise the impact of development through the efficient use and conservation of natural resources of land, water and energy.	+3
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	The policy seeks the preservation and enhancement of Mid Devon's natural landscape safeguarding areas of high landscape quality for public enjoyment. Given access difficulties to areas of high landscape quality the effect is considered minimal for community well-being.	+1
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Development Managements policies on design, flooding, green infrastructure, protected landscapes/habitats and heritage assets provide detailed criteria for development.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The policy will apply over the lifetime of the Plan up to 2033.

Spatial extent: (District wide / local)	The policy applies throughout the district and benefits environmental designations (such as AONBs & National Parks) and biodiversity networks across district boundaries.

Summary of Recommendations

1. Policy S10 - Policy should introduce transport requirements from COR9 as sustainable transport is a key component in preventing climate change.
2. Policy S10 to cross reference DM27 Development affecting heritage assets.

Justification: Heritage assets are protected by other policies within the plan.

Policy S11: Tiverton

This policy sets out Tiverton's role as a medium sized market town serving a rural hinterland.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The option notes that Tiverton will develop in a balanced way as a medium sized market town serving a rural hinterland and aims to retain the green setting provided by the steep open hillsides noting the importance of Knightshayes as a historic parkland to the north of the A361. The option also ensures the protection of areas of biodiversity value and green infrastructure. The option enhances the existing policy by providing flexibility in 'opportunities for enhancement'. The level of development proposed will probably have some negative impact on the natural environment however overall the option is positive in helping to meet this objective as it aims to protect the natural environment where possible.	+2
B) Protection and promotion of a quality built and historic environment	The impact across Tiverton on the built and historic environment is somewhat unknown as this will be dependent on site location and individual proposals. However the option does aim to achieve high quality development and aspires to manage the town centre so that economic success and heritage reinforce each other. The option also promotes the retention of the green setting of the area particularly the historic parkland of Knightshayes. The level of development is likely to have some negative impacts on the built and historic environment in some locations however the option overall has a positive impact in achieving this objective.	+2
C) Mitigating the effects of climate change	The impact of the option on mitigating the effects of climate change is somewhat unknown as this is dependent on individual proposals and site locations. Similar to the existing policy the option aims to enhance public transport, walking and cycling opportunities. The existing policy enhances the potential for mitigating the effects of climate change through including the clause 'reduce the risk of flooding' in comparison to this option. However the option should be read in the context of other policies in the plan which aim to mitigate against the effects of climate change and reduce the risk of flooding. Overall the policy option will have a minor positive impact on this objective through encouragement of sustainable travel.	+1
D) Safeguarding and minimising resource	The impact of this policy option on resources is unknown; the level of impact will be dependent on site location and individual proposals. The option is silent on a number of features regarded in this objective, such as water quality, waste	0

Sustainability objective	Commentary	Impact
use	management and resource efficient design; however the policy should be read in the context of other policies in the plan which safeguard and minimise resource use. There is potential in the policy option through the level of development proposed to negatively impact on resources such as increasing waste levels and loss of agricultural land; however opportunities may also arise from this option to improve water quality through design and remediate contaminated land, the level of impact will be on a site by site basis.	
E) Promoting economic growth and employment	The option will have a significant positive contribution to this objective as it aims to provide for commercial floorspace to meet the needs of the community which increases jobs and reduces out commuting by focusing commercial floorspace in and around the town. It aims to improve access to employment for its population and that of the surrounding rural areas. It guides high quality development and other investment to ensure that economic success and heritage reinforce each other and promotes shops, leisure, offices and key town centre uses in the town centre. It differs from the existing policy as the average annual development rate proposed is lower, in response to up-to-date economic evidence.	+3
F) Supporting retail	The option will have a significant positive contribution in supporting retail through its provision of commercial floorspace to meet the needs of the community. It will enhance the vitality and viability of the town centre of Tiverton promoting shops and key town centre uses. The existing policy in the current plan proposes 3,900m2 of additional comparison net retail floorspace. This option instead proposes 14,000 additional m2 of gross commercial floorspace which could include retail. Enhanced walking and cycling opportunities and bus services around the town particularly to access the town centre is also promoted.	+3
G) Meeting housing needs	The option promotes annual development rates for both market and affordable dwellings which will have a significant positive impact on meet housing needs. The figures reflect the latest housing needs up to 2033 which updates the existing policy in the current plan. The provision of housing in the largest settlement in Mid Devon which had the largest economic concentration and level of social and commercial services suggests that it will be well related to existing services and facilities. The impact of development on the existing services and community facilities is unknown as this will be dependent on the site location individual proposals. The option also promotes new homes in the town centre to reinforce the economic success and heritage in town centres.	+3
H) Ensuring community health and wellbeing	The option has a positive impact on this objective as it aims to improve access to housing, employment and services for its population and that of the surrounding rural areas. The town centre is managed to promote new homes, shops, leisure, offices and key town centre uses. The promotion of new housing and commercial floorspace will help reduce poverty and social exclusion. The option also promotes walking and cycling opportunities which will encourage healthy lifestyles and mitigate against air pollution levels. The option does not account for the provision of open space, sport and recreational opportunities. The impact of this option on noise and light pollution is also unknown. The option should however be read in the context of other policies in the plan.	+2
I) Delivering the necessary infrastructure	The policy option considers the delivery of infrastructure through improving access to housing, employment and services. It also notes that high quality development and investment will be guided to enhance walking and cycling opportunities and bus services around town, particularly to access the town centre and enhance public transport access to Tiverton Parkway Station, Exeter and Taunton. The option also protects green infrastructure and supports opportunities for enhancement. This policy option is likely to have a positive impact on this objective however the impact of this option on	+2

Sustainability objective	Commentary	Impact
	existing infrastructure such as roads and telecommunications is unknown. This policy option should be read in the context of other policies in the plan which set out the delivery of infrastructure.	

Secondary/cumulative/synergistic effects:	The cumulative impact of this policy option will lead to improved access to housing, employment and services for its population. The impact of this option on the existing infrastructure and services is however unknown but should be read in the context of other policies in the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the plan. Once delivered the majority of the development will be permanent. Features such as public transport and services may change over time according to market demand.
Spatial extent: (District wide / local)	Policy helps meet the housing and commercial needs of the district and meets the needs of the local community.

Summary of Recommendations

1. Policy S11 to include a clause to protect the built and historic environment outside of the town centre as well as inside the town centre to enhance sustainability objective B.

2. Policy S11 to reference the enhancement of open space, sport, recreation and cultural opportunities to increase sustainability objective H.

Policy S12: Cullompton
Option 1 – Meet the needs of the community for housing and commercial floorspace

This policy option aims to meet the housing and commercial floorspace needs of the community.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The policy is silent on protecting the natural environment. The impact on the biodiversity and landscape character at and surrounding Cullompton unknown as the level of impact is likely to be dependent on site location and individual proposals. This option aims to continue to develop Cullompton as a small market town and with a town focus strategy, this will help minimise the impact of development on the natural environment. This policy option should be read in the context of other policies which aim to protect the natural environment.	0
B) Protection and promotion of a quality	The option is likely to have a minor positive impact on this option as it aims to achieve high quality development and aspires to manage the town centre so that economic success and heritage reinforce each other. The option is however	+1

Sustainability objective	Commentary	Impact
built and historic environment	silent on the protection and promotion of the built and historic environment outside the town centre and the impact is likely to be dependent on site location and individual proposals, therefore the impact is unknown. This policy option should be read in the context of other policies which aim to protect and promote the built and historic environment.	
C) Mitigating the effects of climate change	The impact of the option on mitigating the effects of climate change is somewhat unknown as this is dependent on individual proposals and site locations. Similar to the existing policy the option has a minor positive impact on this objective as it aims to support the Air Quality Action Plan to enhance walking and cycling opportunities. Further public transport improvements within Cullompton are also promoted. The existing policy however enhances the potential for mitigating the effects of climate change through including the clause 'reduce the risk of flooding' in comparison to this option. The policy option should however be read in the context of other policies in the plan which aim to mitigate against the effects of climate change and reduce the risk of flooding.	+1
D) Safeguarding and minimising resource use	The impact of this policy option on resources is unknown as this will be dependent on site locations and individual proposals. The option is silent on a number of features regarded in this objective, such as water quality, waste management and resource efficient design; however the policy should be read in the context of other policies in the plan. There is potential in the option through the level of development proposed to negatively impact on resources such as increasing waste levels and loss of agricultural land; however opportunities may also arise from this option to improve water quality through design and remediate contaminated land, the level of impact will be on a site by site basis. The town focus element of this option will help restrict the impact of this option in the Cullompton area by limiting development to meet the needs of the community towards the town.	0
E) Promoting economic growth and employment	This option will have a significant positive contribution on this objective as it will meet the employment needs of the community which increases jobs and will reduce out commuting by focussing commercial floorspace in and around the town. It aims to expand employment opportunities for its population and that of nearby rural areas. It guides high quality development and other investment to ensure that economic success and heritage reinforce each other and promotes shops, leisure, offices and key town centre uses in the town centre. It updates the existing employment figures for Cullompton in response to up-to-date economic evidence to meet the needs of the community.	+3
F) Supporting retail	The option will have a significant positive contribution in supporting retail through its provision of commercial floorspace to meet the needs of the community. It will enhance the vitality and viability of the town centre of Cullompton by promoting shops and key town centre uses. It updates the existing employment figures for Cullompton in response to up-to-date economic evidence to meet the needs of the community.	+3
G) Meeting housing needs	The option updated the existing housing figures for Cullompton in response to up-to-date housing evidence which takes the figures up to 2033. The option there will therefore enable the housing target to be met and will have a significant positive contribution to this objective. It sets out figures for both market and affordable dwellings and aims to improve access to housing within the town and improve services for its population. The option also promotes new homes in the town centre to reinforce the economic success and heritage in town centres. The policy option should be read in the context of other policies in the plan that provide further detail regarding housing mix and size.	+3
H) Ensuring community health and wellbeing	The policy option is positive on improving access to housing, expanding employment and improving services for its population and that of the nearby rural areas. The town centre is managed to promote new homes, shops, leisure, offices	+2

Sustainability objective	Commentary	Impact
	and key town centre uses. Through these means the policy option allows for community facilities to be enhanced and will help reduce poverty and social exclusion. The option does not account for the provision of open space, sport and recreational opportunities. The option should however be read in the context of other policies in the plan which promote these services and facilities. The policy option does however promote walking and cycling opportunities which will encourage healthy lifestyles. The option also supports the implementation of the Cullompton Air Quality Action which will help reduce air pollution.	
I) Delivering the necessary infrastructure	The option considers the delivery of infrastructure through improving access to housing, enhancing walking and cycling opportunities around the town, making necessary improvements to the M5 motorway J28 to maintain highway capacity and safety and promotes further public transport improvements within Cullompton, to other urban centres and access to the rail network. This option is likely to have a positive impact on this objective however the impact of this option on existing infrastructure, green infrastructure and telecommunications is unknown. This option should be read in the context of other policies in the plan which set out the delivery of infrastructure.	+2

Secondary/cumulative/synergistic effects:	The cumulative impact of this policy option will lead to improved access to housing, expanded employment opportunities and improved services for its population. The impact of this option on the existing infrastructure and services is however unknown but should be read in the context of other policies in the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the plan. Once delivered the majority of the development will be permanent. Features such as public transport and services may change over time according to market demand.
Spatial extent: (District wide / local)	Policy helps meet the housing and commercial needs of the district and will meet the needs of the local community.

Summary of Recommendations

1. Policy S12 to include reference to biodiversity and green infrastructure, for example, 'Protect areas of biodiversity value and green infrastructure supporting enhancement' to improve sustainability objective A and I.
2. Policy S12 to include a clause to protect the built and historic environment outside of the town centre as well as inside the town centre to enhance sustainability objective B.
3. Policy S12 to make reference to open space, sport, recreation and cultural opportunities to improve sustainability objective H.

Option 2 – Overprovision of housing and commercial floorspace

This policy option is an over provision of housing and commercial floorspace to help meet the needs of the district as well as the local needs of Cullompton.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The policy is silent on protecting the natural environment. The impact on the biodiversity and landscape character at and surrounding Cullompton is unknown as the level of impact is likely to be on dependent on site location and individual proposals. The level of development which is approximately double of the needs of Cullompton is likely to at least have a negative impact on the natural environment due to the scale of development. This policy option should be read in the context of other policies which aim to protect the natural environment.	-2
B) Protection and promotion of a quality built and historic environment	The option aims to achieve high quality development and aspires to manage the town centre so that economic success and heritage reinforce each other. The scale of development is likely to have some negative impact on the built and historic environment in some locations. The option is silent on the protection and promotion of the built and historic environment outside the town centre and the impact is likely to be dependent on site location and individual proposals and therefore the impact is unknown. This policy option is therefore likely to have both positive and negative impacts on this objective. The option should be read in the context of other policies which aim to protect and promote the built and historic environment.	0
C) Mitigating the effects of climate change	The impact of the option on mitigating the effects of climate change is somewhat unknown as this is dependent on individual proposals and site locations. Similar to the existing policy the option aims to support the Air Quality Action Plan to enhance walking and cycling opportunities. Further public transport improvements within Cullompton are also promoted. The existing policy however enhances the potential for mitigating the effects of climate change through including the clause 'reduce the risk of flooding' in comparison to this option. The option should be read in the context of other policies which aim to mitigate against the effects of climate change and reduce the risk of flooding. As the option does not proactively mitigate the effects of climate change but is likely to reduce carbon emissions through the promotion of sustainable travel and supporting the Air Quality Action Plan the option is likely to have a minor positive impact on this objective.	+1
D) Safeguarding and minimising resource use	The impact of this option on resources is somewhat unknown however the scale of the development to meet approximately double the needs of the community in Cullompton is likely to increase resource use and negatively impact on this objective including the loss of versatile agricultural land however the exact extent of the impact will be based on site locations and individual proposals. The option is silent on a number of features regarded in this objective, such as water quality, waste management and resource efficient design. The option should be read in the context of other policies in the plan. There is potential in the policy option through the level of development proposed to negatively impact on resources such as increasing waste levels; however opportunities may also arise from this option to improve water quality through design and remediate contaminated land, the level of impact will be on a site by site basis.	-2
E) Promoting economic growth and employment	This option will have a significant positive contribution on this objective as it aims to expand employment opportunities for its population and that of nearby rural areas as well as the district as a whole. It guides high quality development and other investment to ensure that economic success and heritage reinforce each other and promotes shops, leisure, offices and key town centre uses.	+3

Sustainability objective	Commentary	Impact
F) Supporting retail	The option will have a significant positive contribution in supporting retail through its provision of commercial floorspace to meet the needs of the community and the district. It will enhance the vitality and viability of the town centre of Cullompton by promoting shops and key town centre uses.	+3
G) Meeting housing needs	This option overprovides housing for the local community to help meet the housing needs of the district. The option will therefore enable the housing target to be met and will have a significant positive contribution to this objective. The policy option promotes new homes in the town centre to reinforce the economic success and heritage in town centres. The option sets out annual development rates for both market and affordable dwellings and should be read in the context of other policies in the plan which provide further detail regarding housing mix and size. The option aims to improve access to housing within the town and improve services for its population.	+3
H) Ensuring community health and wellbeing	The option is positive on improving access to housing, expanding employment and improving services for its population and that of the nearby rural areas. The town centre is managed to promote new homes, shops, leisure, offices and key town centre uses. Through these means the policy option allows for community facilities to be enhanced and will help reduce poverty and social exclusion. The policy option does not account for the provision of open space, sport and recreational opportunities, the policy should however accord with other policies in the plan which aim to promote these services and facilities. The policy option does however promote walking and cycling opportunities which will encourage healthy lifestyles. The implementation of the Cullompton Air Quality Action Plan is also supported to reduce air pollution.	+2
I) Delivering the necessary infrastructure	The option considers the delivery of infrastructure through improving access to housing, enhancing walking and cycling opportunities around the town, making necessary improvements to the M5 motorway J28 to maintain highway capacity and safety and promotes further public transport improvements within Cullompton, to other urban centres and access to the rail network. This option is likely to have a positive impact on this objective however; the impact of this option on existing infrastructure, green infrastructure and telecommunications is unknown. This policy option should be read in the context of other policies in the plan which set out the delivery of infrastructure.	+2

Secondary/cumulative/synergistic effects:	The cumulative impact of this policy option will lead to improved access to housing, expanded employment opportunities and improved services for its population. The impact of this option on the existing infrastructure and services is unknown but should be read in the context of other policies in the plan. There is the potential for this option to have a negative impact on the natural environment and the existing services provided.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the plan. Once delivered the majority of the development will be permanent. Features such as public transport and services may change over time according to market demand.
Spatial extent: (District wide / local)	The policy option for Cullompton will help meet the needs of the local community as well as the housing and employment needs of the district as a whole.

Summary of Recommendations

1. Policy S12 to include reference to biodiversity and green infrastructure, for example, 'Protect areas of biodiversity value and green infrastructure supporting enhancement' to improve sustainability objective A and I.
2. Policy S12 to include a clause to protect the built and historic environment outside of the town centre as well as inside the town centre to enhance sustainability objective B.
3. Policy S12 to make reference to open space, sport, recreation and cultural opportunities to improve sustainability objective H.

Option 3 – Under provision of housing and commercial floorspace

This policy option is an under provision of housing and commercial floorspace to meet the needs of Cullompton in the event that land between J27 and Willand is promoted as the new community which will help meet the needs of the district as a whole.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The option is silent on protecting the natural environment. The impact on the biodiversity and landscape character at and surrounding Cullompton unknown as the level of impact is likely to be dependent on site location and individual proposals. The option should be read in the context of other policies which aim to protect the natural environment. The under provision of development at Cullompton is likely to minimise the impact on the natural environment in the local area.	0
B) Protection and promotion of a quality built and historic environment	The option is likely to have a minor positive impact on this option as it aims to achieve high quality development and aspires to manage the town centre so that economic success and heritage reinforce each other. The option is however silent on the protection and promotion of the built and historic environment outside the town centre and the impact is likely to be dependent on site location and individual proposals and therefore the impact is unknown. The option should be read in the context of other policies which aim to protect and promote the built and historic environment.	+1
C) Mitigating the effects of climate change	The impact of the option on mitigating the effects of climate change is somewhat unknown as this is dependent on individual proposals and site locations. Although similar to the existing policy the option aims to support the Air Quality Action Plan to enhance walking and cycling opportunities. Further public transport improvements within Cullompton are also promoted. The existing policy however enhances the potential for mitigating the effects of climate change by including the clause 'reduce the risk of flooding' in comparison to this option. However the option should be read in the context of other policies which aim to mitigate against the effects of climate change and reduce the risk of flooding. As the option does not proactively mitigate the effects of climate change but can help reduce carbon emissions through sustainable travel and supporting the Air Quality Action Plan, the option is likely to have a minor positive impact on this objective.	+1
D) Safeguarding and	The impact of this option on resources is somewhat unknown as the level of impact will be on a site by site basis, however	0

Sustainability objective	Commentary	Impact
minimising resource use	the scale of the development which under provides the needs of the community in Cullompton will limit the impact on resource use. The option is silent on a number of features regarded in this objective, such as water quality, waste management and resource efficient design; however the policy should be read in the context of other policies in the plan.	
E) Promoting economic growth and employment	This option will have a positive contribution to this objective as it will help provide commercial floorspace, however this only meets approximately 2/3rds of community need in Cullompton. It aims to expand employment opportunities for its population and that of nearby rural areas as well as the district as a whole. It guides high quality development and other investment to ensure that economic success and heritage reinforce each other and promotes shops, leisure, offices and key town centre uses in the town centre.	+2
F) Supporting retail	The option will have a positive contribution in supporting retail through its provision of commercial floorspace. It will enhance the vitality and viability of the town centre of Cullompton by promoting shops and key town centre uses. It does not however meet the need of the community as it under provides.	+2
G) Meeting housing needs	This option under provides housing for the local community and therefore does not meet the needs of the community as a whole. The policy option does however promote new homes in the town centre to reinforce the economic success and heritage in town centres. The policy option sets out annual development rates for both market and affordable dwellings which meets approximately 2/3rds of community need. The policy option should be read in the context of other policies in the plan that provide further detail regarding housing mix and size. The option aims to improve access to housing within the town and improve services for its population and overall will have a positive impact on this .	+2
H) Ensuring community health and wellbeing	The policy option is positive on improving access to housing, expanding employment and improving services for its population and that of the nearby rural areas. The town centre is managed to promote new homes, shops, leisure, offices and key town centre uses. Overall this option is likely to have a minor positive impact as it contributes to this objective however it does not meet the complete needs of the community which suggest that the level of poverty and social exclusion in line with population growth will not be reduced. The policy option also does not account for the provision of open space, sport and recreational opportunities. It should however accord with other policies in the plan which aim to promote these services and facilities. The policy option does however promote walking and cycling opportunities which will encourage healthy lifestyles. The implementation of the Cullompton Air Quality Action Plan is also supported to reduce air pollution.	+1
I) Delivering the necessary infrastructure	The option considers the delivery of infrastructure through improving access to housing, enhancing walking and cycling opportunities around the town, making necessary improvements to the M5 motorway J28 to maintain highway capacity and safety. It also promotes further public transport improvements within Cullompton, to other urban centres and access to the rail network. This option is likely to have a positive impact on this objective however the impact of this option on existing infrastructure, green infrastructure and telecommunications is unknown. This option should be read in the context of other policies in the plan which set out the delivery of infrastructure.	+2

Secondary/cumulative/synergistic effects:	The cumulative impact of this policy option will lead to improved access to housing, expanded employment opportunities and improved services for its population. The impact of this option on the existing infrastructure

	and services is unknown but should be read in the context of other policies in the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the plan. Once delivered the majority of the development will be permanent. Features such as public transport and services may change over time according to market demand.
Spatial extent: (District wide / local)	The policy option only meets approximately 2/3rds of the housing and employment needs of Cullompton. It will cumulatively help meet the needs of the district as a whole.

Summary of Recommendations

1. Policy S12 to include reference to biodiversity and green infrastructure, for example, 'Protect areas of biodiversity value and green infrastructure supporting enhancement' to improve sustainability objective A and I.
2. Policy S12 to include a clause to protect the built and historic environment outside of the town centre as well as inside the town centre to enhance sustainability objective B.
3. Policy S12 to make reference to open space, sport, recreation and cultural opportunities to improve sustainability objective H.

Policy S13 Crediton

Option 1 – Develop According to need

The strategy aims to improve access to housing within the town, expand employment opportunities and improve the quality of the existing retail provision. The proposal will provide for an average annual development rate of 26 market housing, 14 affordable dwellings and 265 sqm of commercial floor space. Due to the physical constraints of the town's topography, less development was allocated in 2010 than was set out in the Core Strategy (only a total of 413 dwellings and 4,150 square metres employment floorspace). This under-provision of development allocations was considered to be offset by over-provision elsewhere. Option 1 therefore deviates from the Core Strategy by providing sufficient development to meet the town's housing and commercial needs.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This option sets an average annual development rate of 26 market and 14 affordable dwellings, alongside 265sqm of commercial floor space. Given the lack of suitable development sites within the town and the sensitive landscape of the "Crediton Trough" there is a high likelihood that new development will need to be located on land of high landscape value, a significant negative effect. Criteria within the policy however seek only proposals which respect the setting provided by the open areas of hillside and the adjoining historic parkland, a positive effect. On balance therefore this option is considered to have only a slightly negative impact. The policy should be considered in the context of other policies within the plan including those on biodiversity and landscape.	-1

B) Protection and promotion of a quality built and historic environment	The policy option states that all proposals within the town centre will need to play a positive role in sustaining and enhancing the significance of the areas heritage, a positive effect. The option puts development pressure on the town to expand, potentially into the setting of the nearby historic park lands of Creedy Park, Shobrooke Park and Downs, a negative effect. Criteria within the policy however states that development will be supported only where proposals respect the setting of the adjoining historic park land, a mitigating effect. The policy should be considered in the context of other policies within the plan including those on design and the historic environment. On-balance the option is considered to have a neutral effect.	0
C) Mitigating the effects of climate change	The policy option does not contribute towards minimising the risk of flooding, a slight negative effect. The policy should be considered in the context of other policies within the plan including those on flooding and climate change.	-1
D) Safeguarding and minimising resource use	In directing development towards Crediton, the option maximises the potential use of underused land, a positive effect. The proposed level of growth within the policy will however require some loss of greenfield land, a negative effect. On-balance a neutral effect is considered.	0
E) Promoting economic growth and employment	The strategy option aims to expand employment opportunities by providing 265 sqm commercial floorspace as an annual average development rate. Criteria within the policy seek to enhance the tourism and visitor role of the town and surrounding countryside. Criteria within the policy allows for development that support the economic regeneration of the town centre and commercial development, a significant positive effect. The option will therefore significantly contribute to meeting the employment needs of the community, encourage inwards investment and promote future prosperity.	+3
F) Supporting retail	The strategy aims to improve the quality of the existing retail provision within the town. Criteria within the policy allow for development that support the economic regeneration of the town centre and other key town centre uses which support the town centre's viability and vitality, a significant positive effect. Particular support will be given for proposals which improve the quality of existing retail provision within the town centre. The policy seeks an average development rate of 265 sqm commercial floorspace per annum of which a portion will be expected to be retail. On balance a positive effect is considered given the uncertainty surrounding the retail target.	+2
G) Meeting housing needs	The strategy aims to improve access to housing within the town by setting an average development rate of 26 market and 14 affordable dwellings per annum. This option provides sufficient development to meet the town's housing needs, a significant positive effect. This approach will also improve access to local services and facilities a further positive.	+3
H) Ensuring community health and wellbeing	Historically poor air quality is a factor which has an impact on Crediton's development, with the town being a designated Air Quality Management Area as a result of unacceptably high levels of airborne pollutants in the centre of the settlement. New development may impact on air quality, a negative effect. A criterion in the policy seeks the continuation of measures to support the implementation of the Crediton Air Quality Action Plan, beyond the completion of the Crediton link road if still required. The proposed level of growth at Crediton will improve cultural, sport and recreation opportunities, enable walking and cycling and promote healthy lifestyles, a positive effect. On balance, given the positive and negative effects a neutral effect is considered appropriate.	0
I) Delivering the necessary infrastructure	The policy strategy directs development to Crediton a sustainable settlement helping to reduce the overall need to travel, reducing traffic congestion and increasing access to key services, a significant positive effect. The policy should be considered in the context of other policies within the plan including those on infrastructure.	+3

Secondary/cumulative/synergistic effects:	The policy should be used alongside policies S11-S15.

Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered permanent.
Spatial extent: (District wide / local)	The policy applies to within the settlement limits of Crediton only.

Summary of Recommendations

1. Policy S13 to clarify definition of 'Commercial Floor Space' to specifically reference retail development.
2. Policy S13 to cross reference flooding policy S10 Environment.

Justification: Measures to reduce the risk of flooding are justified in other policies within the plan.

Option 2 – Under provision due to local constraints

The strategy aims to improve access to housing within the town, expand employment opportunities and improve the quality of the existing retail provision. The proposal will provide for an average annual development rate of 16 market housing, 8 affordable dwellings and 208 sqm of commercial floor space. Due to the physical constraints of the town's topography, less development was allocated in 2010 than was set out in the Core Strategy (only a total of 413 dwellings and 4,150 square metres employment floorspace). Option 2 continues the approach set out in the Allocations & Infrastructure DPD by providing less development as a result of the constraint provided by the challenging local topography.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This option sets an average annual development rate of 16 market and 8 affordable dwellings, alongside 208sqm of commercial floor space. The housing number under Option 2 are calculated based on only including allocated sites that have not yet been built out, and other sites assessed under the SHLAA process (Strategic Housing Land Availability Assessment) that are deliverable without having large landscape and/or visual impacts. The employment figure has been calculated based on existing allocations not yet built out. Given the housing and commercial targets are based on allocations that do not need to compromise the landscape setting of Crediton, a positive effect is considered. Criteria within the policy also seek only proposals which respect the setting provided by the open areas of hillside and the adjoining historic parkland, a further positive effect. The policy should be considered in the context of other policies within the plan including those on biodiversity and landscape.	+2
B) Protection and promotion of a quality built and historic environment	The policy option states that all proposals within the town centre will need to play a positive role in sustaining and enhancing the significance of the areas heritage, a positive effect. The housing number under Option 2 are calculated based on only including allocated sites that have not yet been built out, and other sites assessed under the SHLAA process (Strategic Housing Land Availability Assessment) that are deliverable without having large landscape and/or visual impacts. The employment figure has been calculated based on existing allocations not yet built out. Criteria within the policy state that development will be supported only where proposals respect the setting of the adjoining historic park land, a	0

Sustainability objective	Commentary	Impact
	mitigating effect. The policy should be considered in the context of other policies within the plan including those on design and the historic environment. On-balance the option is considered to have a neutral effect.	
C) Mitigating the effects of climate change	The policy option does not contribute towards minimising the risk of flooding, a slight negative effect. The policy should be considered in the context of other policies within the plan including those on flooding and climate change.	-1
D) Safeguarding and minimising resource use	In directing development towards Crediton, the option maximises the potential use of underused land, a positive effect. The proposed level of growth within the policy will however require some loss of greenfield land, a negative effect. On-balance a neutral effect is considered.	0
E) Promoting economic growth and employment	The strategy option aims to expand employment opportunities by providing 208 sqm commercial floorspace as an annual average development rate. This option provides less development as a result of the constraint provided by the challenging local topography. The employment figure has been calculated based on existing allocations not yet built out. Criteria within the policy seek to enhance the tourism and visitor role of the town and surrounding countryside. Criteria within the policy allows for development that support the economic regeneration of the town centre and commercial development, a significant positive effect. Given this option does not meet all of Crediton's commercial needs a negative effect is anticipated. This option therefore only slightly contributes to meeting the employment needs of the community, encourages inwards investment and promotes future prosperity. On balance a slight positive effect will be experienced.	-2
F) Supporting retail	The strategy aims to improve the quality of the existing retail provision within the town. Criteria within the policy allow for development that support the economic regeneration of the town centre and other key town centre uses which support the town centre's viability and vitality, a significant positive effect. Particular support will be given for proposals which improve the quality of existing retail provision within the town centre. The policy seeks an average development rate of 208 sqm commercial floorspace per annum of which a portion will be expected to be retail. On balance a positive effect is considered given the uncertainty surrounding the retail target.	+2
G) Meeting housing needs	The strategy aims to improve access to housing within the town by setting an average development rate of 16 market and 8 affordable dwellings per annum. This Option provides less development as a result of the constraint provided by the challenging local topography. The housing number under Option 2 has been calculated based on including allocated sites that have not yet been built out, and other sites assessed under the SHLAA process (Strategic Housing Land Availability Assessment) that are deliverable without having large landscape and/or visual impacts. Given this option does not meet all of Crediton's housing need a negative effect is anticipated. This approach will also improve access to local services and facilities a positive effect.	-2
H) Ensuring community health and wellbeing	Historically poor air quality is a factor which has an impact on Crediton's development, with the town being a designated Air Quality Management Area as a result of unacceptably high levels of airborne pollutants in the centre of the settlement. New development may impact on air quality, a negative effect. A criterion in the policy seeks the continuation of measures to support the implementation of the Crediton Air Quality Action Plan, beyond the completion of the Crediton link road if still required. The proposed level of growth at Crediton will improve cultural, sport and recreation opportunities, enable walking and cycling and promote healthy lifestyles, a positive effect. On balance, given the positive and negative effects a neutral effect is considered appropriate.	0
I) Delivering the necessary	The policy strategy directs development to Crediton a sustainable settlement helping to reduce the overall need to travel, reducing traffic congestion and increasing access to key services, a significant positive effect. The policy should be	+3

Sustainability objective	Commentary	Impact
infrastructure	considered in the context of other policies within the plan including those on infrastructure.	

Secondary/cumulative/synergistic effects:	The policy should be used alongside policies S11-S15.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered permanent.
Spatial extent: (District wide / local)	The policy applies to within the settlement limits of Crediton only.

Summary of Recommendations

1. Policy S13 to clarify definition of 'Commercial Floor Space' to specifically reference retail development.
2. Policy S13 to cross reference flooding policy S10 Environment.

Policy S14 Villages

Option

Policy option identifies a list of 22 rural settlements designated as villages and suitable for small scale housing, employment, tourism and leisure, services and facilities and limited development that enhances community vitality or meets local social or economic need. Option deviates from Core Strategy through the identification of Bampton as a rural village. The definition of "rural village" within the supporting text has also been simplified to require settlements to only three key services for inclusion; an education facility, convenience store and transport service. Based on the amended criteria, Holcombe Rogus is identified as an additional settlement. Burlescombe (including Westleigh) did not meet the essential criteria. Yeoford does not meet the essential criteria of the policy as it does not have a shop however it has been included as an exception because of its strong transport links, a bus and daily train service.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Development is limited to minor proposals within the defined settlement limits, a significant positive effect in protecting the countryside. Hemyock is located in the Blackdown Hills Area of Outstanding Natural Beauty (AONB).	+3
B) Protection and promotion of a quality built and historic environment	The policy makes no reference to the built or historic environment. A large number of the villages have conservation areas.	0
C) Mitigating the	The policy makes no reference to climate change mitigation or flood risk. The option directs some limited growth to villages with	+1

effects of climate change	the most services therefore reducing the need to travel, a minor positive effect.	
D) Safeguarding and minimising resource use	The policy makes no reference to safeguarding or minimising resources.	0
E) Promoting economic growth and employment	Criteria within the policy allow for employment, tourism and leisure development within rural settlements and development that enhances community vitality and social and economic needs, a significant positive effect towards economic growth and employment in the district.	+3
F) Supporting retail	Criteria within the policy allow for services and facilities within rural settlements and development that enhances community vitality and social and economic needs, a significant positive effect towards supporting the self-sufficiency of rural shopping.	+3
G) Meeting housing needs	National planning policy advocates the provision of market housing in rural areas where it would facilitate the delivery of significant affordable housing required to meet housing need. To facilitate the provision of affordable housing in villages across Mid Devon, the supporting text of the policy clarifies that some market housing may be permitted. Rural exception sites will also be considered in line with development management policies and an existing Supplementary Planning Document on Meeting Housing Needs. The policy is supportive of small scale housing, a significant positive effect.	+3
H) Ensuring community health and wellbeing	The option criteria allow for service and facilities serving the locality and other limited development which enhances community vitality or meets a local social or economic need. The policy option contributes towards maintaining and enhancing community facilities, provision of open space and the district's cultural sport and recreation opportunities. This wording directly accords with the SA objective to ensure community health and well-being, a significant positive effect. The supporting text lists transport services as one of the key criteria for defining rural settlements and therefore the list of 22 settlements will be locations most accessible by public transport. The option does not consider light, noise or air pollution, a negative effect. On-balance the policy is considered still to have a significant positive effect.	+3
I) Delivering the necessary infrastructure	The supporting text clarifies that rural settlements should include an education facility, convenience store and transport service to be listed as a sustainable location for development. Burlescombe (including Westleigh) did not meet the essential criteria are are not proposed to be carried forward. Yeoford does not meet the essential criteria of the policy as it does not have a shop however it has been included for its strong transport links with provision of a bus and daily train service, a negative effect. The policy directs development to sustainable locations helping to reduce the overall need to travel, reducing traffic congestion and increasing access to key services, a significant positive effect. As the criteria do not list access to health or social care, this option could be directing development away from the most sustainable locations in respect of health, a negative effect. On-balance the policy option is considered to still have a positive effect.	+2

Secondary/cumulative/synergistic effects:	The policy should be used alongside policies S11-S15. The policy does not prevent the cumulative impact of development within the policy or through other development management policies.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered permanent.
Spatial extent: (District wide / local)	Policy is restricted to land within defined settlement limits of villages.

Summary of Recommendations

1. No recommendations from SA.

Policy S15 Countryside
Option

Policy option restricts development outside the settlements defined by Policies S11-S14 to that which will enhance the character, appearance and biodiversity of the countryside while promoting sustainable diversification of the rural economy. Option deviates from the Core Strategy through a change in the definition of affordable housing which can now include market housing and reference to rural workers rather than agricultural or forestry workers. The option also introduces appropriate residential conversion of existing buildings and amends horse riding establishments to equestrian development. Golf facilities are no-longer specifically mentioned.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The policy option strictly controls development outside of defined settlement boundaries (Policies S11-S14) to a limited number of uses that promote sustainable diversification of the rural economy, a significant positive effect in protecting the countryside. The policy option also requires development to enhance the character, appearance and biodiversity of the Countryside, reinforcing this significant positive effect.	+3
B) Protection and promotion of a quality built and historic environment	The policy options allows for the residential conversion of existing buildings and appropriately scaled and designed extensions and other physical alterations, but does not reference the appropriate use and/or access to buildings of historical / cultural value, a negative effect.	-2
C) Mitigating the effects of climate change	Option allows for renewable energy proposals in the countryside, a significant positive effect towards mitigating the effects of climate change. The policy option does not contribute towards minimising the risk of flooding, a negative effect. The policy should be considered in the context of other policies within the plan including those on flooding and climate change. On balance the option is considered to therefore have a positive effect.	+2
D) Safeguarding and minimising resource use	The policy options allows for the conversion of existing buildings and appropriately scaled and designed extensions and other physical alterations, a significant positive effect towards the re-use of previously developed land and buildings. The policy restricts development in the open countryside minimising the loss of greenfield land. Option supports development such as residential conversions and other uses in rural locations often with few connections to the existing waste water / sewage network, although alternative storage solutions exist, this option is considered to have only a slight negative effect. On balance this option is considered to have a positive effect to the safeguarding and minimising resource use.	+2
E) Promoting economic growth	The policy is particularly supportive of development that promotes the sustainable diversification of the rural economy, a significant positive effect towards economic growth. The policy includes criteria for appropriately scaled, retail, employment, farm	+3

and employment	diversification, agricultural and equestrian development, tourism and leisure related development, a further positive effect. Other criteria include equestrian development, renewable energy and telecommunications which are all actives that can further contribute to the rural economy and inward investment.	
F) Supporting retail	The policy includes criteria for appropriately scaled, retail development that will enhance the self-sufficiency of rural shopping, a significant positive effect.	+3
G) Meeting housing needs	The central aim of the policy is to strictly control development in the open countryside, outside settlement limits to that which will enhance the character, appearance and biodiversity of the countryside while promoting sustainable diversification of the rural economy. The policy significantly restricts market housing in the open countryside therefore reducing access to market housing, a negative effect. The policy is however more supportive of affordable housing to meet local needs, gypsy and traveller accommodation and residential conversions, a significant positive effect. On-balance a neutral effect is considered to best represent the positive and negative effects.	0
H) Ensuring community health and wellbeing	Community facilities, such as education facilities, buildings associated with public open space, transport and infrastructure proposals will be permitted, a significant positive effect towards community health and well-being. The option does not consider light, noise or air pollution a negative effect or encourage sustainable means of travel either through, walking, cycling or public transport, a negative effect. On-balance a minor positive effect is considered.	+1
I) Delivering the necessary infrastructure	Community facilities, such as education facilities, buildings associated with public open space, transport and infrastructure proposals will be permitted, a significant positive effect towards infrastructure provision. This approach provides better access to schools, supports telecommunications, reduces traffic congestion and the unacceptable pressure on existing infrastructure. The option does not specifically reference health facilities, a slight negative effect.	+3

Secondary/cumulative/synergistic effects:	The policy should be used alongside policies S11-S15. The policy does not prevent the cumulative impact of development within the policy or through other development management policies.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered permanent.
Spatial extent: (District wide / local)	The policy applies district wide with the exception of sites within defined settlement limits (Policies S11-S14).

Summary of Recommendations

1. No recommendations from SA.

Tiverton Site Options

Policy TIV1: Eastern Urban Extension

Preferred Option

A site of 153 hectares at Tiverton Eastern Urban Extension is allocated for mixed used development including 1000-1500 dwellings, 35% affordable housing subject to further assessment of viability to include at least five pitches for gypsies and travellers and 35,000-40,000 square metres employment floorspace. Transport provision, environmental protection, community facilities, carbon reduction, agreed phasing and a public Masterplanning exercise are also required.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	6.91ha of the site forms part of Tidcombe Fen which is a SSSI. A number of important trees are in the centre of the site. There are records of common dormice nests, badger setts, otters and water voles within the site. The canal to the south of the site is a conservation area, County Wildlife Site and Local Nature Reserve. The site is typified as being an open, low lying flat landscape which is agriculturally prosperous. Given the presence of an important protected area (SSSI), important trees and biodiversity there is potential for development on this site to negatively impact on species, habitats and sites designated for their nature conservation interests. The policy requires 'environmental protection and enhancement' which will help mitigate against the impact on this objective however the level of development on the site will have an impact on the character of the area.	-2
B) Protection and promotion of a quality built and historic environment	The site contains two listed buildings which are located towards the south. The site also contains some Scheduled Ancient Monuments including one Long Barrow located in the north of the site. There is also an area of archaeological potential. The site contains pockets of housing and other development, school and playing fields. The level of development will be a large urban extension significantly larger than the existing development at post hill. A masterplan could help minimise the impact on the built and historic environment and there is the potential to enhance the built environment through good design, however it is likely that there will be some negative impact on this sustainability objective due to the scale of development proposed and the presence of heritage assets which could be affected by this development. The policy requires a public Masterplanning exercise to be undertaken before any planning application is made and which will improve the quality of the final design of the development.	-2
C) Mitigating the effects of climate change	The majority of the site (152.5ha) is in flood zone 1 with the rest of the site in flood zone 2 and 3, a neutral effect. Energy use in buildings account for nearly half of emissions of carbon dioxide, with more than a quarter coming from the energy used to heat, light and run homes. The policy requires carbon reduction and air quality improvements and will help mitigate the effects of climate change. Transport provision to ensure appropriate accessibility for all modes is also supported. A waste to energy plant is also mentioned in the supporting text as a potential addition to the employment area. This will help minimise the overall carbon footprint of the development. There are no existing services or facilities however the draft policy promotes community facilities to meet local needs arising. Given the scale of the development at this site it is likely some negative impacts will occur with regard to carbon emissions through construction and increased traffic movement, however if the mitigating clauses in the policy are upheld positive impacts will also occur. Taking into account flood risk and	+1

Sustainability objective	Commentary	Impact
	mitigation measures for climate change an overall slight positive effect is considered.	
D) Safeguarding and minimising resource use	The majority of the site is made up of Grade 2 agricultural land based on 1991 mapping data which was surveyed by the resource planning group. It is likely that this site will have a negative impact on this objective due to the scale of development of a site that is predominantly Grade 2 agricultural greenfield land. The supporting text of the policy mentions the potential to include a 'waste-to-energy' plant within the site. The site scores negatively in this objective.	-3
E) Promoting economic growth and employment	The development of this site would not result in the loss of any employment land. The policy for the Eastern Urban Extension allocates 35,000-40,000 m2 of employment floorspace. The site would provide the opportunity to enhance this sustainability objective. The level of employment floorspace allocated is justified by recent evidence provided by the Employment Land Review. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+3
F) Supporting retail	The provision for retail is uncertain however the opportunity to provide for retail on-site is provided by the allocation of 35,000-40,000 m2 of employment floorspace. The impact on the town Tiverton town centre is also uncertain as there could be both positive and negative impacts. However overall it is likely there will be a positive impact on the support for retail with a large scale housing development in the largest town in the district.	+2
G) Meeting housing needs	The site allocation will provide for 1000-1500 dwellings which will include 35% affordable housing subject to further assessment of viability and to include at least five pitches for gypsies and travellers. The site therefore will have a significant positive impact on meeting housing needs for the district.	+3
H) Ensuring community health and wellbeing	The site allocation makes note of carbon reduction and air quality improvements which will help minimise pollution and benefit community health and wellbeing. Option will contribute towards light and noise pollution, a slight negative effect. The policy also promotes the delivery of community facilities to meet local needs arising and transport provision to ensure appropriate accessibility for all modes. This suggests that opportunities for sustainable forms of travel may arise. The policy does not mention the provision of open space, sport or recreation or the reduction of crime. It is however noted in the supporting text that the policy for this site will be supplemented by a suite of policies similar to those already adopted. It is therefore likely that this site will have a positive impact on this objective.	+2
I) Delivering the necessary infrastructure	The policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements, for example, to M5 J27 before this site is developed. In general, schools in Tiverton are anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect. Option will support the provision of Green Infrastructure through criteria within the policy. The policy for this site will be supplemented by a suite of policies similar to that already adopted for which currently the supplementary policies include the provision of a new junction to the A361 and a new primary school. Traffic calming and sustainable modes of transport are also supported. The site is therefore likely to deliver the necessary infrastructure for the site which may also benefit the surrounding community.	+2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Overall the development of this site will help meet the housing and commercial needs of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time of the site is approximately 10 years. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help meet the housing needs of the district. Development would be focussed as an extension to the biggest town in the district.

Summary of Recommendations

The final policy would be supplemented by a suite of detailed policies on the issues listed below similar to those already adopted (existing Policies AL/TIV/2-7):

1. Transport provision
2. Environmental protection and green infrastructure including Tidcombe Fen SSSI and Grand Western Canal Wildlife site and Local Nature Reserve.
3. Archaeological investigation, protection of listed buildings & Scheduled Ancient Monument (SAM)
4. Flood mitigation & Sustainable Urban Drainage (SUD)
5. Community facilities
6. Carbon reduction & air quality
7. Construction impact and the treatment of waste
8. Masterplanning & phasing

Policy TIV2: Hartnoll Farm

Option

A site of 70 hectares at Hartnoll Farm could be allocated for residential development including 1100 dwellings, 35% affordable housing subject to further assessment of viability. Transport provision, environmental protection, community facilities, carbon reduction, agreed phasing and a public Masterplanning exercise are also required.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is located in the open countryside. The site comprises a number of fields which are bounded by mature hedgerows and trees throughout the site. The site is bordered by the Grand Western Canal Conservation Area to the south and east of the site. The canal is also a County Wildlife Site and Local Nature Reserve. The supporting text to the policy states that if the site is allocated, land adjacent to the Grand Western Canal would need to be protected from development and set aside as green infrastructure. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. Development of the site would have a potential significant visual impact and would impact on the biodiversity and habitats of the area, however the policy requires environmental protection and enhancement which will help mitigate against any negative impact on this objective by the development of this site.	-2
B) Protection and promotion of a quality built and historic environment	The site lies in an area of archaeological potential with the HER recording prehistoric activity here and recent archaeological work has identified prehistoric activity across the wider landscape. A small part of the border is next to residential development and there are farm buildings within the site. The level of development proposed will be significant and therefore would likely impact the built and historic environment. However as there are no protected built or historic assets in or around the site the impact on this objective will be minor. Archaeological investigations should be completed to support any planning application for development here however this is not currently required by the policy. The policy requires a public Masterplanning exercise to be undertaken before any planning application is made and which will improve the quality of the final design of the development.	-1
C) Mitigating the effects of climate change	The entire site is in a low risk area (flood zone 1) being the area of least flood risk. Energy use in buildings account for nearly half of emissions of carbon dioxide, with more than a quarter coming from the energy used to heat, light and run homes. The policy requires carbon reduction and air quality improvements which will help mitigate the effects of climate change. Transport provision to ensure appropriate accessibility for all modes is also supported by the policy and traffic through Halberton and Sampford Peverell is discouraged. There are no existing services, infrastructure or facilities within the site or in close proximity. Given the scale of the development at this site it is likely some negative impacts will occur with regard to carbon emissions through construction and increased traffic movement, however if the mitigating clauses in the policy are upheld positive impacts will also occur. Taking into account flood risk and mitigation measures for climate change an overall slight positive effect is considered.	+1
D) Safeguarding and minimising resource use	The majority of the site 68.7ha (71%) to the NE of the site is Grade 1 agricultural land. It is likely that this site will have a negative impact on this objective due to the scale of development of a site that is predominantly Grade 1 agricultural greenfield land which would be lost if this site is developed. The site will therefore have a significant negative impact on this objective.	-3
E) Promoting economic growth and employment	There are existing employment units on this site which could be retained. The policy option does not propose employment development on this site. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this	+2

Sustainability objective	Commentary	Impact
	development. There would be a positive effect.	
G) Meeting housing needs	The site allocation will provide for 1100 dwellings which will include 35% affordable housing subject to further assessment of viability. The site therefore will have a significant positive impact on meeting housing needs for the district.	+3
H) Ensuring community health and wellbeing	The site allocation makes note of carbon reduction and air quality improvements which will help minimise pollution and benefit community health and wellbeing. Option will contribute towards light and noise pollution, a slight negative effect. The policy also promotes the delivery of community facilities to meet local needs arising and transport provision to ensure appropriate accessibility for all modes. The policy does not mention the provision of open space, sport or recreation or the reduction of crime. It is therefore likely that this site will have a positive impact on this objective.	+2
I) Delivering the necessary infrastructure	The policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements before this site is developed. In general, schools in Tiverton are anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect. The policy for this site requires a public Masterplanning exercise to be undertaken before any planning application is made. The site is therefore likely to deliver the necessary infrastructure for the site with the potential to also benefit the surrounding community.	+2

Secondary/cumulative/synergistic effects:	The potential cumulative impact of the development of this site on traffic, pressure on local services and facilities and the current provision of infrastructure should be mitigated by the policy criteria. Overall the development of this site will help meet the housing and commercial needs of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time of the site is approximately 10+ years. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help meet the housing needs of the district. Development would be focussed as an extension to the biggest town in the district.

Summary of Recommendations

1. Archaeological investigation and appropriate mitigation to enhance sustainability objective B.
2. Land adjacent the Grand Western Canal will need to be protected as Green Infrastructure.

Policy TIV3: Farleigh Meadows
Preferred Option

A site of 11.2 hectares at Farleigh Meadows is allocated for residential development, subject to; 300 dwellings (35% affordable), amenity open space within the flood zone, two vehicular points, cycle and pedestrian routes, protection of TPOs, design and landscaping, Sustainable Urban Drainage (SUD) & mitigation of impact on air quality.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site has a number of Oak Trees which are protected by TPOs. The Council will review existing species or habitats information held on previously allocated sites and will commission where necessary further site-specific evidence as required. The results will be used to update this sustainability appraisal accordingly. Criteria with the policy seek their protection and incorporation into open space where appropriate, a neutral effect. The policy option also requires careful design and landscaping treatment of the boundary between housing and amenity open space, taking account of impact on views from the north and east.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located partly in Flood zone 1 to the west and Flood Zone 2&3 in the east. The policy option notes that 300 dwellings will be on land in flood zone 1. Criteria within the policy seek mitigation measures through retention of land in the floodplain as informal amenity open space and the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off. Given the mitigation measures within policy criteria a neutral effect is considered.	0
D) Safeguarding and minimising resource use	Development option is located on approximately 40% grade 2 agricultural land to the west and 60% of grade 4 agricultural land to the east. Development option is located on greenfield land which would be lost if this site is developed. Overall this has a negative effect on this sustainability objective.	-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	Option is located within walking distance to the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+2
G) Meeting housing needs	Option provides for 300 new dwellings of which 35% should be affordable a contribution towards future housing need, a significant positive effect.	+3
H) Ensuring community health and wellbeing	The site is located within walking distance of Tiverton Town Centre. The policy option requires 3 hectares of informal amenity open space with appropriate security measures to prevent access to and pollution of the Mill Leat. Option will contribute towards light and noise pollution, a slight negative effect.	+2

Sustainability objective	Commentary	Impact
	The option also requires pedestrian and cycle routes and measures to mitigate impact on air quality on Leat Street. Overall this will have a positive impact on this sustainability objective.	
I) Delivering the necessary infrastructure	Criteria within the policy require two vehicular access points and cycle and pedestrian links between Rackenford Road, Higher Loughborough and Washfield Lane, incorporating and enhancing the Exe Valley, a positive effect. In general, schools in Tiverton are anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect. On balance the impact of this development on this sustainability objective will be neutral.	0

Secondary/cumulative/synergistic effects:	The potential cumulative impact of the development of this site on traffic, pressure on local services and facilities and the current provision of infrastructure should be mitigated by the policy criteria. Overall the development of this site will help meet the housing needs including affordable housing of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	A outline planning application for development at Farleigh Meadows has been resolved to be granted subject to a Section 106 planning obligation being finalised. Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help meet the housing needs of the district. Development would within the biggest town in the district and within walking distance to the town centre.

Summary of Recommendations

1. ‘Community facilities to meet local needs arising’ will help ensure that the capacity of primary and secondary schools is not breached.
2. Renewable Energy & Travel Plans.
3. Development Brief.

Policy TIV4: Blundells School

Option

A site of 14 hectares north of Blundells School could be allocated for mixed use development, subject to; 200 dwellings (35% affordable), 7000 square metres B1 or other suitable employment floorspace, 8 hectares of informal green infrastructure, land shaping to raise areas for development above flood zone 3, provision of a

junction on Heathcoat Way, provision and enhancement of cycle and pedestrian links in the area, site contamination assessment, provision of Sustainable Urban Drainage (SUD) and implementation of transport plans.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is located within the settlement of Tiverton. There is minimal impact on landscape character and development could improve the current site which comprises of a number of elements including a scrap yard and former poultry handling factory. The Council will review existing species or habitats information held on previously allocated sites and will commission where necessary further site-specific evidence as required. The results will be used to update this sustainability appraisal accordingly.	+3
B) Protection and promotion of a quality built and historic environment	The site lies in an area of archaeological potential with regard to known prehistoric activity in the wider landscape. Development on this site has the potential to have a minor negative impact in contributing towards achieving this objective.	-1
C) Mitigating the effects of climate change	The majority of the site is in flood zone 3 (64.4%). The policy requires land shaping to raise areas for development above flood zone 3, including an allowance for climate change, and to create additional floodplain to compensate for the loss of floodplain. The policy also requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance. Energy use in buildings account for nearly half of emissions of carbon dioxide, with more than a quarter coming from the energy used to heat, light and run homes. The policy also requires the implementation of transport plans and other transport measures to minimise carbon footprint and air quality impacts. Taking into account flood risk and mitigation measures for climate change an overall neutral effect is considered.	0
D) Safeguarding and minimising resource use	This site is comprised of brownfield and grade 4 greenfield land. The policy requires a site contamination assessment and remediation to mitigate risks associated with the former and currently land uses. The development of this site would result in both a positive and negative impact on this objective however on balance the site would be reusing a relatively large brownfield site which would overall result in a positive score.	+2
E) Promoting economic growth and employment	The development of this site would results in the loss of vacant industrial land. However the allocation includes 7000 sqm. of B1 or other employment uses resulting in a balanced score. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+2
F) Supporting retail	This site would add to housing in a town, close to the town centre. There is potential for this site to support retail in Tiverton.	+2
G) Meeting housing needs	The site allocation will provide for 200 dwellings which will include 35% affordable housing. The site therefore will have a significant positive impact on meeting housing needs for the district.	+3
H) Ensuring community health and wellbeing	The site option requires the provision and enhancement of cycle and pedestrian links in the area. The option policy requires the remediation of contaminated land. It also requires the implementation of transport plans and other transport measures to minimise carbon footprint and air quality impacts. Option will contribute towards light and noise pollution, a slight negative effect. The site is also close to the town centre of Tiverton and therefore is likely to be within walking distance to	+1

Sustainability objective	Commentary	Impact
	services. The development of this site is therefore likely to have a minor positive impact on this objective.	
I) Delivering the necessary infrastructure	The policy requires land shaping to raise areas for development above flood zone 3 and the provision of a junction on Heathcoat Way and road access through the site to form part of a link road with the Eastern Urban Extension (depending on whether the urban extension is enlarged by virtue of Policy Tiv2, Hartnoll Farm option). The policy option requires the provision and enhancement of cycle and pedestrian links in the area. The option also requires implementation of transport plans and other transport measures to minimise carbon footprint and air quality impacts. The option is likely to deliver the necessary infrastructure for the site. In general, schools in Tiverton are anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect. However overall given the enhancement of the cycle and pedestrian links and other transport measures a slight positive effect is considered.	+1

Secondary/cumulative/synergistic effects:	The potential cumulative impact of the development of this site on traffic, pressure on local services and facilities and the current provision of infrastructure should be mitigated by the policy criteria. Overall the development of this site will help meet the housing and commercial needs of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time of the site is approximately 2-4 years. The scrapyard is only available if an alternative site can be found in the near vicinity.
Spatial extent: (District wide / local)	This site option will help meet the housing and employment needs of the district. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. Archaeological investigation and appropriate mitigation.
2. ‘Community facilities to meet local needs arising’ will help ensure that the capacity of primary and secondary schools is not breached.
3. Remediation of contaminated land.
4. Waste mitigation.
5. Renewable Energy.
6. Development Brief.

Policy TIV5: Howden Court
Preferred Option

A site of 0.47 hectares at Howden Court is allocated for residential development, subject to; 10 dwellings (35% affordable), the setting of Land East of the Grade II Listed Howden Court remains open and includes the provision of Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The landscape impact would not be significant as the site is well screened and has significant tree cover, a neutral effect.	0
B) Protection and promotion of a quality built and historic environment	Land is located near to the Grade II Listed Howden Court with development expected to respect its setting to remain open, a neutral effect.	0
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest probability of flooding, a neutral effect. Criteria within the policy seek the provision of sustainable urban drainage schemes to deal with all surface water the development and arrangement of future maintenance.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land with no agricultural grade, given the sites scale a neutral effect.	0
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	Option is located within walking distance to the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1
G) Meeting housing needs	Option is well related to the existing built form at Tiverton, a positive effect. Option provides for 10 new dwellings of which 35% should be affordable a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	The site is located within walking distance of Tiverton Town Centre and there are a number of shops, a school, a bus stop and other services close by, a minor positive effect.	+1
I) Delivering the necessary infrastructure	In general, schools in Tiverton are anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	The impact of developing this site is expected to be minimal. Density is expected to be low and the level of development is at a level where harm is not expected. The development overall will help add to meeting the housing and the commercial needs of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time of the site is approximately 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet some housing needs within Tiverton including the provision of affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. 'Community facilities to meet local needs arising' will help ensure that the capacity of primary and secondary schools is not breached.

Policy TIV6: Town Hall / St Andrews Street
Preferred Option

A site of 0.5 hectares at St Andrews Street is allocated for residential development, subject to; 55 dwellings (35% affordable), protection of the character of adjoin listed buildings and enhances the setting of the River Exe, Archaeological investigation, flood evacuation access routes and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	As the site is located within the settlement of Tiverton there would be minimal impact on landscape character. There may be some impact on the setting of the River Exe however the policy option requires design which enhances the setting of the River Exe. Overall this will be a minor positive effect.	+1
B) Protection and promotion of a quality built and historic environment	There are listed buildings adjoining the site. Criteria within the policy seek design which protects the character of the adjoining listed buildings and enhances the setting of the River Exe. The policy option also requires the archaeological investigation and appropriate mitigation. Overall a neutral effect.	0
C) Mitigating the effects of climate change	The site is located partly in Flood zone 1 to the east and Flood Zone 2 & 3 in the west. Criteria within the policy seek mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off, raised ground floors and the provision of flood evacuation access routes. Given the mitigation measures within criteria within the policy a neutral effect is considered.	0
D) Safeguarding and	Development option is located on 'urban' brownfield land. The policy option also incorporates the conversion of buildings	+2

Sustainability objective	Commentary	Impact
minimising resource use	adjoining St Andrew Street, a positive effect.	
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	Option is located within walking distance to the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1
G) Meeting housing needs	Option provides for 55 new dwellings of which 35% should be affordable a contribution towards future housing need, a positive effect. The site has planning permission for retirement apartments that will contribute towards meeting the needs of the towns aging population.	+2
H) Ensuring community health and wellbeing	The site is located within walking distance of Tiverton Town Centre, a minor positive effect.	+1
I) Delivering the necessary infrastructure	The site is accessible, a neutral effect. In general, schools in Tiverton are anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect. As infrastructure is not noted in the policy criteria overall a minor negative impact is felt.	-1

Secondary/cumulative/synergistic effects:	The development overall will help add to meeting the housing including affordable housing of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The site has planning permission for 45 retirement apartments, excluding the 10 dwellings to be provided through conversion of buildings adjoining St Andrew Street. Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. Once developed, the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet some housing needs within Tiverton including the provision of affordable housing. Development would be within Tiverton, the largest town in the district.

Summary of Recommendations

1. ‘Community facilities to meet local needs arising’ will help ensure that the capacity of primary and secondary schools is not breached.

Policy TIV7: Roundhill
Preferred Option

A site of 0.4 hectares at Roundhill is allocated for residential development, subject to; 13 affordable dwellings and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site contains mature hedgerows and trees which for a visual break between the higher and lower parts of the existing development, a neutral effect. Development of the area would result in the loss of hedgerows and trees, a neutral effect.	0
B) Protection and promotion of a quality built and historic environment	There are potential historic mineshafts in the area (which are currently being investigated).	?
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk, a neutral effect. The policy option also requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance.	0
D) Safeguarding and minimising resource use	This site is located on brownfield land, a positive effect.	+2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	Option is located within walking distance to shops and services. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1
G) Meeting housing needs	Option provides for 13 new affordable dwellings a contribution towards future housing need, a slightly positive effect.	+1
H) Ensuring community health and wellbeing	The site is within walking distance to West Exe and the town centre although up a steep gradient and there are bus stops located on Seven Crosses Hill. There are pedestrian footpaths around the site. Given the sites distance from the town centre and public transport connectivity an overall minor positive effect is considered.	+1
I) Delivering the necessary infrastructure	The topography of the site would be a constraint to the deliverability of the site, as well as potential historic mineshafts in the area (which are currently being investigated). There is existing highway access however the loss of the garages may impact on the parking provision for the area, a slight negative effect. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	The cumulative impact of developing this site is expected to be minimal. The development overall will help add to meeting the affordable housing needs of Tiverton.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time of the site is approximately 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet some of the affordable housing need within Tiverton. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. Archaeological investigation and appropriate mitigation.
2. 'Community facilities to meet local needs arising' will help ensure that the capacity of primary and secondary schools is not breached.

Policy TIV8: Hay Park, Canal Hill
Preferred Option

A site of 0.3 hectares at Hay Park, Canal Hill is allocated for residential development, subject to; 13 dwellings (35% affordable), Sustainable Urban Drainage (SUD) and access to be gained from Canal Hill.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site does contain some mature trees which the criteria within the policy states should be retained. Development on this site would have minimal landscape impact as it is within the built up area of Tiverton, a neutral effect.	0
B) Protection and promotion of a quality built and historic environment	This proposed development area occupies the former settlement of Haypark, first documented in the late 17th century. The site is now occupied with modern housing and any development here may expose archaeological and artefactual deposits associated with this settlement. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, a slight negative effect. There is a potential minor negative impact on the character of the area.	-1
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk, a neutral effect. The option also requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance.	0
D) Safeguarding and minimising resource	Development option is located on greenfield land which has no agricultural grade, a neutral effect.	0

Sustainability objective	Commentary	Impact
use		
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1
G) Meeting housing needs	Option provides for 13 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Option is not located within walking distance to the town centre a slight negative effect. There are bus stops located along Canal Hill and there are shops located close by. There are no cycle paths, but there is a pedestrian footpath into Tiverton Town Centre. Overall a neutral effect is considered.	0
I) Delivering the necessary infrastructure	The topography of the site would be a constraint to development, as would the access. The retention of the character of the existing buildings would be preferable. The policy option states that access should be gained from Canal Hill. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	The impact of developing this site is expected to be minimal. The development overall will help add to meeting the housing needs of Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time of the site is approximately 1-2 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet some of the housing needs within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. Archaeological investigation and appropriate mitigation.
2. 'Community facilities to meet local needs arising' will help ensure that the capacity of primary and secondary schools is not breached.

Policy TIV9: The Avenue
Preferred Option

A site of 0.4 hectares at The Avenue is allocated for residential development, subject to; 15 dwellings (35% affordable), pavement along the southern boundary and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The impact on the surrounding landscape would be minimal as the site is surrounded by residential development, a neutral effect.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The policy option also requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance.	0
D) Safeguarding and minimising resource use	Development option is located on brownfield land, a positive effect.	+2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1
G) Meeting housing needs	Option provides for 15 new dwellings including affordable housing a contribution towards future housing need, a slightly positive effect.	+1
H) Ensuring community health and wellbeing	The site is within walking distance of the town centre but up a steep gradient. Criteria within the policy seek provision of pavement along the southern boundary of the site, a slight positive effect. There is a bus stop on Canal Hill within walking distance.	+1
I) Delivering the necessary infrastructure	The site is located on a poor junction of Canal Hill and The Avenue with poor visibility. It is located on a steep hill and there is no pedestrian access. The policy option requires the provision of a pavement along the southern boundary of the site. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	The impact of developing this site is expected to be minimal. The development overall will help add to meeting the housing needs of Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. An estimated development time has not been stated by the proposer and is therefore unknown.
Spatial extent: (District wide / local)	This site option will help meet some of the housing needs within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. 'Community facilities to meet local needs arising' will help ensure that the capacity of primary and secondary schools is not breached.

Policy TIV10: Tidcombe Hall

Option

A site of 8.4 hectares at Tidcombe Hall allocated for residential development, subject to; 200 dwellings (35% affordable), two vehicular access points from Canal Hill and improvement s to Tidcombe Lane, protection of the setting of the Grand Western Canal Conservation Area and Tidcombe Hall and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site contains mature hedgerows and trees and the canal is also a defined County Wildlife Site & Local Nature Reserve. At this stage, the Council is not aware of the presence of protected species. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. There is a potential, but localised impact on character as the site is reasonably well contained within the landscape. There would be some impact arising from development, though this would be against the backdrop of the existing built environment to the west, a slight negative effect. The policy option also requires the protection of the setting of the Grand Western Canal Conservation Area.	-1
B) Protection and promotion of a quality built and historic environment	The site is located on the south eastern edge of Tiverton and is close to the Grand Western Canal Conservation Area with 1.6ha of the site is within the Grand Western Canal Conservation Area (19% northern part). This site includes the site of the medieval chapel of St Lawrence and Tidcombe Hall. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required. The site lies just to the west of Tidcombe Farmhouse which contains Tidcombe Hall, a 19th century house that was formerly a rectory. There is also a record of a domestic chapel at this site that was licensed in the early 15th century. A desk-	0

Sustainability objective	Commentary	Impact
	based assessment followed by appropriate archaeological mitigation would be required. The policy criteria seek the protection of the setting of the Grand Western Canal Conservation Area and of Tidcombe Hall.	
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk. However the proximity of the site to, and within, the Grand Western Canal Conservation Area, the problems of accessing the site and the high percentage of flooding all constrain the appropriateness and deliverability of this site, a neutral effect.	0
D) Safeguarding and minimising resource use	The site is made up of a variation of land which has a number of different grades, including urban land and grade 1 agricultural land. Development option is located partly on greenfield land which would be lost if this site is developed. As approximately 75% of the site is made up of Grade 1 and Grade 2 agricultural land, development of this site will have a significant negative impact on this objective.	-3
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+2
G) Meeting housing needs	Option provides for 200 new dwellings a contribution towards future housing need and includes provision for affordable housing, a significant positive effect.	+3
H) Ensuring community health and wellbeing	There are shops along Canal Hill which are easily accessible, but the site is not within walking distance of Tiverton town Centre, a slight negative effect. There are bus stops located on Tidcombe Lane and a footpath on the opposite site of Tidcombe Lane leading to Canal Hill.	-1
I) Delivering the necessary infrastructure	Criteria within the policy seek two vehicular access points from Canal Hill and improvements to Tidcombe Lane northwards from the site, a slight positive effect. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	The development overall will help meet the housing needs of Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. An estimated development time has not been stated by the proposer and is therefore unknown.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. 'Community facilities to meet local needs arising' will help ensure that the capacity of primary and secondary schools is not breached.
2. Waste mitigation.
3. Archaeological investigation.
4. Renewable energy.
5. Development Brief.

Policy TIV11: Wynnards Mead, Bakers Hill

Option

A site of 5.8 hectares at Wynnards Mead, Bakers Hill, subject to; 100 dwellings (35% affordable), design that minimises impact to landscape character and setting of the adjoining listed building and the provision of Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. This site falls within the 'River valley slopes and coombes' landscape character area. This area typically falls within the River Exe valley and often has steep, wooded sides and a strong sense of enclosure within a lush valley landscape. The site is elevated, and therefore is visible from a number of viewpoints, including Seven Crosses Road to the south. Accordingly, there would be some impact from development in this location, however the policy requires design which minimises impact to the landscape character, overall a minor negative impact with this mitigation measure.	-1
B) Protection and promotion of a quality built and historic environment	The site, which lies to the west of Tiverton, consists of the grounds of a large house called Wynnards Mead, including some associated agricultural land and two cottages. Gotham Farm adjoins the site to the west. The site is in close proximity to a listed building to the immediate west of the site. Criteria within the policy requires design which protects the character and setting of the adjoining listed buildings, a neutral effect.	0
C) Mitigating the effects of climate change	The site is set on the north side of the Cottey Brook, sloping down north to south. The largest portion of the site, 5.8ha (92% North) is located in Flood zone 1, the lowest risk of flooding. 0.5ha of the site (8% South) is located in Flood zones 2 and 3. The policy option requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance. On balance it is felt that development of this site would have a neutral effect.	0
D) Safeguarding and	2.1ha (33% S and W) of the site is located on Grade 3 very good quality agricultural land, 4.2ha (67% NE) of the site is located	-1

Sustainability objective	Commentary	Impact
minimising resource use	on unclassified agricultural grade and a small area of contaminated land (historic quarry, 0.06ha in north). On balance development of this site would result a minor negative impact on this objective.	
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect. . Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+2
G) Meeting housing needs	Option provides for 100 new dwellings a contribution towards future housing need including affordable housing, a significant positive effect.	+3
H) Ensuring community health and wellbeing	The services and facilities of Tiverton lie some 1.2 km distant. The site is located within walking distance to Tiverton town centre and is close to a bus service into Tiverton.	+1
I) Delivering the necessary infrastructure	An adequate site access is achievable however the existing carriageway and footway links to Tiverton are very steep. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	The development overall will meet the housing needs of Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 3 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district. The provision of 100 dwelling will help meet the housing needs of the district as a whole.

Summary of Recommendations

1. ‘Community facilities to meet local needs arising’ will help ensure that the capacity of primary and secondary schools is not breached.
2. Waste mitigation.
3. Renewable Energy.

Policy TIV12: Land at Moorhayes Park

Option

A site of 0.4 hectares at Brickhouse Lane subject to; 12 dwellings (35% affordable), access from Hayne Court, archaeological investigation and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	An outline planning application for eight dwellings on the site was submitted in August 2013 (ref 13/01149/MOUT). The Wildlife Survey that accompanies the outline planning application concludes, after having undertaken a preliminary ecological appraisal notes that the site is of limited ecological value. This site falls within the built up area of Tiverton and as a result there will be no landscape impact, a neutral effect.	0
B) Protection and promotion of a quality built and historic environment	This site lies in an area where there is known prehistoric activity. The policy option requires archaeological investigation and appropriate mitigation. It is therefore likely that this will have a neutral impact.	0
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk. The policy option also requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance, a neutral effect.	0
D) Safeguarding and minimising resource use	The site is located on Grade 2 very good quality agricultural land, a negative effect. 50% of the site is contaminated land, without mitigation noted in the policy this is a negative impact.	-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1
G) Meeting housing needs	Option provides for 12 new dwellings including 35% affordable housing a contribution towards future housing need in Tiverton, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Services are available on Lea Road and Tiverton town centre is relatively close, a slight positive effect.	+1
I) Delivering the necessary infrastructure	As existing access from Hayne Court is adequate and the site is well connected within Moorhayes with pedestrian and cycle routes throughout, a positive effect. The policy option notes that access will be provided from Hayne Court. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect.	0

Sustainability objective	Commentary	Impact
	Given the site access is adequate and the site is well connected but education capacity is nearing its limitation, an overall neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The estimated development time for this site is 1 year. A developer has applied to build on the site although for a lower number of houses; nevertheless the timescale of this development is likely to be short. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. Incorporate remediation of contaminated land within the policy option.
2. 'Community facilities to meet local needs arising' will help ensure that the capacity of primary and secondary schools is not breached.

Policy TIV13: Exeter Hill Option

A site of 1.8 hectares at Exeter Hill is allocated for residential development subject to; 20 dwellings (35% affordable), access from Devonshire Rise and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is bounded by hedges and trees and there are wide views across Tiverton and to the ridges to the north. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. This site falls within the 'River valley slopes and coombes' landscape character area. This area typically falls within the River Exe valley and often has steep, wooded sides and a strong sense of enclosure within a lush valley landscape. Development on this site would extend the built form of Tiverton further up this hillside. The site is steeply sloping, with large views of Tiverton and would be highly visible from town. The site is currently open and tranquil, and has views to the north, east and west and there would be a landscape impact of locating housing within this area. Although the level of development is relatively low this would result in a negative effect on this objective due to the context of the site.	-2
B) Protection and	Archaeological work here has identified the presence of earthwork features across this site that may be indicative of	-1

Sustainability objective	Commentary	Impact
promotion of a quality built and historic environment	archaeological activity. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, a slight negative effect.	
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk. The policy option also requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance. Overall development of this site will have a neutral effect on this objective.	0
D) Safeguarding and minimising resource use	3.4ha (68% South) of the site is located on Grade 3 good / moderate quality agricultural land and 1.6ha (32% North is located on unclassified agricultural grade, an overall slight negative effect.	-1
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1
G) Meeting housing needs	Option provides for 20 new dwellings including 35% of affordable housing a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Tiverton town centre lies in reasonably close proximity and a bus service is available on Canal Hill but there is no footway on Exeter Hill which is very steep. Overall this is a neutral impact.	0
I) Delivering the necessary infrastructure	The Highway Authority feel that there are difficulties to access the site due to the substandard nature of the junction with Canal hill and the gradient and topography of the site as well as lack of footways to Tiverton. The Highway Authority note potential opportunities to access the site with the area however the area itself is nearing capacity. The policy option requires access from Devonshire rise. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect. Given the access and connectivity issues and education capacity, an overall negative effect is considered.	-2

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 1 year. A developer has applied to build on the site although for a lower number of houses; nevertheless the timescale of this development is likely to be short. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Tiverton including for affordable

	housing. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. Design which minimises impact to the landscape character.
2. To include as a policy criteria 'archaeological investigation and appropriate mitigation'.
3. There may be potential to amend policy criteria b) 'Access from Devonshire Rise' to reflect advice from Highways. I.e. two access points are suggested from Devonshire Rise and an access point from Butterleigh Drive for emergency access and footway/cycleway.

Policy TIV14: Leat Street

Option

A site of 0.2 hectares at 29-31 Leat Street could be allocated for residential development subject to; 8 dwellings (35% affordable), improvements to access onto Leat Street, investigation of increased flood risk, archaeological interest and site contamination, design which respects and enhances the character of the Conservation Area and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the centre of Tiverton and there will be no impact on landscape character, neutral effect.	0
B) Protection and promotion of a quality built and historic environment	The site is located within the Tiverton Conservation Area, however the policy requires design which respects and enhances the character of the Conservation area. This site also lies within the historic core of the town and in an area shown by historic maps to have been occupied by Sewards Court. These buildings appear to have been demolished sometime in the late 20th century. Any development here has the potential to expose archaeological and artefactual deposits associated with these dwellings. The policy option requires the investigation of archaeological interest with mitigation as appropriate. Overall development of this site would have a neutral effect on this sustainability objective.	0
C) Mitigating the effects of climate change	The site is located in Flood zone 2, however the policy option requires the investigation of increased flood risk with mitigation as appropriate. The policy option also requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance. With the mitigation requirements of the policy option development of this site will have a neutral effect on this objective.	0
D) Safeguarding and minimising resource use	Development option is located on brownfield land. Potential for contaminated land at the site although an enhanced pollution survey (dating back to 1999) stated the site was free of contamination. Nevertheless the policy option requires the investigation of site contamination with mitigation as appropriate. As this option is on brownfield land and could improve	+2

Sustainability objective	Commentary	Impact
	potentially contaminated land, a positive effect is felt.	
E) Promoting economic growth and employment	The garage towards the back of the site is currently in use, while the showroom and forecourt are currently vacant. Development of the site will result in the loss of employment land, a negative effect.	-2
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1
G) Meeting housing needs	Option provides for 8 new dwellings including 35% affordable housing, a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Tiverton town centre lies in reasonably close proximity and there are footpaths along both sides of Leat Street as well as on-road cycle links, a positive effect.	+2
I) Delivering the necessary infrastructure	There is an existing access directly onto Leat Street. The policy option requires improvement to the access onto Leat Street, a positive effect. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured, a slight negative effect. Given the availability of an access and connectivity issues but the potential issue around educational capacity, an overall slight positive effect is considered.	+1

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. To incorporate an element of employment.
2. 'Community facilities to meet local needs arising' will help ensure that the capacity of primary and secondary schools is not breached.

Policy TIV15: Palmerston Park Option

A site of 0.9 hectares at Palmerston Park could be allocated for residential development subject to; 15 affordable dwellings and the provision of Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are a number of tall trees on the eastern boundary and the site is elevated above the road. The site currently comprises trees and scrubland. The Council will review existing species or habitats information held on previously allocated sites and will commission where necessary further site-specific evidence as required. The results will be used to update this sustainability appraisal accordingly. The site falls within the 'River valley slopes and coombes' landscape character area. The area often has steep, wooded sides and a strong sense of enclosure with a lush valley landscape. There is a potential impact on the landscape character due to the lack of trees on the elevated part of the site. The site is visible from the east side of the River Exe. As the site will be small scale this will have a minor negative impact on this sustainability objective.	-1
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk. The policy option also requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance.	0
D) Safeguarding and minimising resource use	The site is located on greenfield land which has no agricultural land class. There are potential mine shafts in the vicinity of the site, which are currently being investigated, a minor negative effect.	-1
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1
G) Meeting housing needs	Option provides for 15 affordable dwellings, a contribution to future housing needs. A slight positive effect.	+1
H) Ensuring community health and wellbeing	Development of this site would result in the loss of the current use as a park. There are pedestrian footpaths leading into the town centre and a bus stop at Palmerston Park. The site is within walking distance to West Exe shops and services within Tiverton Town Centre. On balance development of this site is felt to have a neutral effect.	0
I) Delivering the necessary infrastructure	The topography of the site would be a major constraint as it is very steep where it is adjacent to the road. There is no current access to the site. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a flood plain and therefore additional land near/adjacent to the existing site needs to be secured.	-2

Sustainability objective	Commentary	Impact
	Overall due to the lack of infrastructure development of this site may have a negative effect.	

Secondary/cumulative/synergistic effects:	The development will help meet the affordable housing needs in Tiverton.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the affordable housing needs within Tiverton. Development would be focussed in Tiverton, the largest town in the district.

Summary of Recommendations

1. Design which minimises impact to the landscape character.
2. 'Community facilities to meet local needs arising' will help ensure that the capacity of primary and secondary schools is not breached.

Policy TIV16: Phoenix Lane Option

A site of 1 hectare at Phoenix Lane is allocated for redevelopment as a high quality shopping, leisure and residential area with accessible public space including 60 dwellings with 35% affordable housing and 9,300 square metres of mixed commercial floorspace.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This is a town centre site located within an existing built up area, with no anticipated impact on landscape character, a neutral effect.	0
B) Protection and promotion of a quality built and historic environment	The site is within the conservation area, and contains a number of listed buildings including a number of listed buildings in close proximity to the site. The site also includes a War Memorial. The policy option requires outstanding design that announces the southern entrance to Tiverton's primary shopping area while enhancing the character and appearance of the Conservation Area and avoiding significant adverse impact to listed buildings. On balance although the development would impact the conservation area and listed buildings, enhancement of the site would have a minor positive impact on this sustainability objective.	+1
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk, a neutral effect.	0

Sustainability objective	Commentary	Impact
D) Safeguarding and minimising resource use	This site is located on brownfield land, a positive effect.	+2
E) Promoting economic growth and employment	Development of this site may result in the loss of some employment space however the policy provides for 9,300 square metres of mixed commercial floorspace including retail, office and leisure uses. On balance this would have a significant positive effect on this sustainability objective through the provision of employment space and enhancement of the site.	+3
F) Supporting retail	The site is located within the town centre. The policy option requires outstanding design that announces the southern entrance to Tiverton's primary shopping area, therefore helping to enhance the vitality and viability of the town centre, a significant positive effect.	+3
G) Meeting housing needs	The policy option requires 60 dwellings including 35% affordable housing. This helps to meet the housing needs of Tiverton including affordable housing, a positive effect.	+2
H) Ensuring community health and wellbeing	The site currently includes the bus station. The policy option requires the redesign and enhancement of the bus station. The site is in a town centre location where there are a wide range of services. The development of this site may impact on the pedestrianized public space which includes a war memorial garden. The policy option requires improved pedestrian access between Phoenix Lane and Pannier Market, and between Phoenix Lane and the multi-storey car park. The policy option also requires adequate parking and service areas to serve the needs of existing the proposed uses. Overall development of this site would have a positive impact on this sustainability objective.	+2
I) Delivering the necessary infrastructure	Phoenix Lane pedestrianized walk currently provides access from Phoenix Lane to Fore Street. The far north of the site includes land which connects the Fore Street from the Market Walk to the market itself. In general, schools anticipated to be at or nearing capacity. There is limited capacity to support future development and new primary school provision will be required. It is anticipated the secondary school will need to be expanded but sits within a floodplain and therefore additional land near/adjacent to the existing site needs to be secured. The policy option requires the redesign and enhancement of the bus station. Improved pedestrian access between Phoenix Lane and the Pannier market, and between Phoenix Lane and the multi-storey car park. Adequate parking and service areas to serve the needs of existing and proposed uses. Overall some enhancement of the infrastructure of the site will be provided and will therefore have a minor positive impact on this sustainability objective.	+1

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs including affordable housing in Tiverton. The development also adds to mixed commercial floorspace which will enhance Tiverton town centre, the largest town in the district.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	During construction there may be some short term temporary interruptions to some services. The estimated development time for this site currently unknown. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs including affordable housing within

	Tiverton. Development would be focussed in Tiverton, the largest town in the district. Development of the town centre has the potential to benefit the surrounding area of Tiverton who use Tiverton town centre for shopping and retail.

Summary of Recommendations

1. Relocation or safeguarding of the memorial garden and war memorial.

Policy TIV17: Land at Bampton Street / William Street Car Park

Option

A site of 1 hectare at William Street could be allocated for redevelopment as a high quality shopping, leisure and residential area with accessible public space including 60 dwellings with 35% affordable housing and 9,300 square metres of mixed commercial floorspace.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This is a town centre site located within an existing built up area, with no anticipated impact on landscape character, a neutral effect.	0
B) Protection and promotion of a quality built and historic environment	The site is located in the conservation area and is adjacent to a number of listed buildings. The policy option requires design that respects and enhances the character and appearance of the Conservation Area. On balance development of this site may have a minor negative impact as although the Conservation Area is protected in policy, there is no similar clause to protect the listed buildings in the vicinity.	-1
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk, a neutral effect.	0
D) Safeguarding and minimising resource use	This site is located on brownfield land, a positive effect.	+2
E) Promoting economic growth and employment	Development of this site may result in the loss of some employment space however the policy provides for 9,300 square metres of mixed commercial floorspace including retail, office and leisure uses. On balance this would have a significant positive effect on this sustainability objective through the provision of employment space and enhancement of the site.	+3
F) Supporting retail	The site is located within the town centre therefore helping to enhance the vitality and viability of the town centre, a significant positive effect.	+3
G) Meeting housing	The policy option requires 60 dwellings including 35% affordable housing. This helps to meet the housing needs of Tiverton	+2

Sustainability objective	Commentary	Impact
needs	including affordable housing, a positive effect.	
H) Ensuring community health and wellbeing	The site is within the town centre and close to existing bus service provision and a wide range of service. Development of the site could result in the loss of the 'New Hall' and Constitutional Club, the policy option requires the appropriate relocation of New Hall and Constitutional Club. Development of the site would also result in the loss of the Post Office Depot. The policy option currently does not require the relocation of this service. Overall due to the close relationship of the development to service and facilities but the potential loss of the Post Office Depot the development of the site would have a minor positive impact on this sustainability objective.	+2
I) Delivering the necessary infrastructure	Part of the site is currently used as a public car park. The policy option requires the retention of a public car park and adequate parking and service areas to serve the needs of existing and proposed uses. The policy does not require infrastructure as part of the development, although this will likely be provided at a planning application stage the policy option overall would result in a neutral effect on this sustainability objective.	0

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs including affordable housing in Tiverton. The development also adds to mixed commercial floorspace which will enhance Tiverton town centre, the largest town in the district.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	During construction there may be some short term temporary interruptions to some services. The estimated development time for this site currently unknown. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs including affordable housing within Tiverton. Development would be focussed in Tiverton, the largest town in the district. Development of the town centre has the potential to benefit the surrounding area of Tiverton who use Tiverton town centre for shopping and retail.

Summary of Recommendations

1. Avoidance of significant adverse impact to listed buildings.
2. Relocation of the Post Office depot.
3. Requirement of necessary infrastructure.

Cullompton Site Options

Policy CU1 North West Cullompton
Preferred Option

A site of 74.8 hectares to the North West of Cullompton is allocated for mixed use development subject to; 1100 dwellings (35% affordable), 5 pitches for gypsies and travellers, 10,000 sqm of commercial floor space, transport provision, environmental protection, community facilities, air quality improvements, phasing strategy and master planning exercise.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are a number of protected trees and hedgerows within the site, along field boundaries. The Council will review existing species or habitats information held on previously allocated sites and will commission were necessary further site-specific evidence. The results will be used to update this sustainability appraisal accordingly. This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The landscape is undulating, with the higher parts more sensitive to change and development. Developing this area will extend the built up area of the town, from an agricultural landscape, which will be a significant change. However, the visibility from elsewhere varies across the site. The more elevated parts of the site (such as St Andrews Hill and Rull Hill) are more sensitive to development because of their visibility in the landscape (particularly on north and west facing slopes). Other parts of the site are relatively contained by the topography and development in these locations would have only a medium impact. Criteria within the policy seek mitigation measures through environmental protection and enhancement, a positive effect. Given some higher parts of the site are sensitivity to change and development so overall a slight negative effect is anticipated.	-1
B) Protection and promotion of a quality built and historic environment	The site adjoins a roman fort on St Andrew's Hill (a scheduled ancient monument). There are a number of listed buildings within the cemetery and farmyards adjoining the site. The site lies in an area of high archaeological potential to the north of the Roman fort at St Andrew's Hill and contains evidence of prehistoric activity identified through aerial photography and findspots of flint tools. Recent archaeological investigations in this area have demonstrated the presence of extensive and significant prehistoric and Romano- British sites. Criteria within the policy seek mitigation measures through environmental protection and enhancement, a slight negative effect. The policy requires a public Masterplanning exercise to be undertaken before any planning application is made and which will improve the quality of the final design of the development.	-1
C) Mitigating the effects of climate change	72ha (96%) of the site falls within Flood Zone 1 with a remaining 2ha (3% central and east part of site) within Flood zone 2 and 3 and 0.8ha (1% central and west part of site) connected to flood zone 2 and 3. The northern boundary of site is adjacent to the flood plain. The site is largely outside the highest areas of flood risk, a neutral effect. Criteria within the policy seek mitigation measures through environmental protection and enhancement. Energy use in buildings account for nearly half of emissions of carbon dioxide, with more than a quarter coming from the energy used to heat, light and run homes. Criteria within the policy seek carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, a slight positive effect.	+1

	Taking into account flood risk and mitigation measures for climate change an overall slight positive effect is considered.	
D) Safeguarding and minimising resource use	Development option is located on greenfield land, which is considered to be negative impact on resource use. 56.8ha (76% northern and southern parts) of the site is located on Grade 1 agricultural land of the highest quality, whilst 18ha (24% central part of the site) is located on Grade 4, poor quality agricultural land. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of the highest grade agricultural land, a negative effect is considered.	-3
E) Promoting economic growth and employment	Option provides 10,000 sqm of commercial floorspace reflecting the recommendation of the Employment Land Review (2012) helping to diversify the economy and encourage inward investment, a significant positive effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. Providing employment sites near where to people live would provide the opportunity to reduce out-commuting, levels of which are high within the district. There would therefore be a positive impact.	+3
F) Supporting retail	The policy contains no retail proposals. Though the high street and supermarket are not within easy walking distance of all parts of the site, it is still anticipated that they would benefit from the custom of the residents from this development. Therefore a positive impact has been assumed.	+2
G) Meeting housing needs	Option is well related to existing housing development and services forming a logical extension to the north west of Cullompton, a positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. The option provides for 1,100 new dwellings of which 35% should be affordable and 5 gypsy and traveller sites making a significant contribution towards future housing need, a positive effect.	+3
H) Ensuring community health and wellbeing	There is a medical centre located adjacent to the east side of the northern element of the site and a number of rights of way/bridleways run through the site. Criteria within the policy seek community facilities to meet local needs arising, which is considered to be a positive effect. The option will have an impact on Cullompton Air Quality Management area which will require some mitigation, with the policy seeking measures through environmental protection and enhancement, carbon reduction and air quality, which is considered to be a positive effect. The existing site allocation for North West Cullompton includes the provision of a road linking Tiverton Road to Willand Road. This, along with delivery of the Eastern Relief Road, is intended to significantly reduce the amount of traffic in the town centre. This should in turn improve the air quality and town centre vitality (as it would direct traffic away from the high street) and is at the heart of the long term development strategy for Cullompton. The option will contribute towards the provision of open space, sport and recreation facilities, which is also considered to be a positive impact.	+2
I) Delivering the necessary infrastructure	The policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements, for example, to M5 J28 before this site is developed. The policy requires masterplanning to take place to ensure that the necessary infrastructure is delivered at a rate to support the additional development without placing unacceptable demands on existing capacity. A road link between Tiverton Road and Willand Road will be delivered as part of bringing the site forward, whilst the site will contribute towards the cost of the Eastern Relief Road, a key element of local infrastructure. Part of the site is close to St. Andrew's Primary School; however the quantum of development will require an additional school to be built to meet identified need. Criteria within the policy seek community facilities to meet local needs arising and the site is of a sufficient scale for infrastructure improvements within and outside of the site, a positive effect. The policy also contains provision for strategic scale green infrastructure to be delivered in tandem with the site. Overall, provision of the necessary infrastructure, which is to be determined by the masterplan, is considered a positive impact arising from the policy.	+2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time of the site is approximately 15 years. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help meet the housing needs of the district. Development would be focussed as an extension to the second town in the district.

Summary of Recommendations

The final policy would be supplemented by a suite of detailed policies on the issues listed below similar to those already adopted (existing Policies AL/CU/2-7):

1. Transport provision
2. Environmental protection and green infrastructure
3. Archaeological investigation & protection of listed buildings
4. Provision of Sustainable Urban Drainage (SUD)
5. Community facilities
6. Carbon reduction & air quality
7. Construction impact and the treatment of waste
8. Masterplanning & phasing

Policy CU2 Growen Farm Option

A site of 23 hectares at Growen Farm could be allocated for mixed use development as an extension to CU1 (North West Cullompton), subject to; 400 dwellings (35% affordable), transport provision, environmental protection, community facilities, air quality improvements, phasing strategy and master planning exercise.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. Developing the site would result in further expansion of Cullompton to the north west. The site is a within a bowl, particularly the eastern part, and as a result landscape impact could be lower than the west if this element is developed. Some views from Rull Lane to the north and from the bridleway. Little other impact as not visible from Tiverton Road. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. Criteria within the policy seek mitigation measures through environmental protection and enhancement, a positive effect. Some landscape impacts would arise as a result of developing the site. Overall a negative impact has been assumed.	-1
B) Protection and promotion of a quality built and historic environment	There is a listed building to the north of the site which could be affected by developing in this location. The site lies in an area of archaeological potential to the north-west of the Roman fort at St Andrew's Hill and to the south of a possible prehistoric enclosure identified through aerial photography. Any planning application for development here must be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of any development upon it. Criteria within the policy seek mitigation measures through environmental protection and enhancement, a slight negative effect. The policy requires a public Masterplanning exercise to be undertaken before any planning application is made and which will set criteria to guide the quality of the final design of the development. Overall, given the potential for negative impacts on heritage assets, but positive criteria in terms of design, a neutral score has been assumed.	0
C) Mitigating the effects of climate change	A stream runs along the eastern boundary of the site and therefore a flood risk assessment may be required to determine whether there would be any impact from developing the site, even though the site is located in Flood zone 1 and is therefore located largely outside the highest areas of flood risk. Criteria within the policy seek mitigation measures through environmental protection and enhancement. Energy use in buildings account for nearly half of emissions of carbon dioxide, with more than a quarter coming from the energy used to heat, light and run homes. Criteria within the policy seek carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, a slight positive effect. Taking into account flood risk and mitigation measures for climate change an overall slight positive effect is considered.	+1
D) Safeguarding and minimising resource use	Development option is located on greenfield land, a negative effect. Site is located on Grade 2 very good quality agricultural land, a negative effect. Only 11% of land within the district is grade 2.	-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect. Development of this scale could be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	Option is located beyond easy walking distance to the town centre or supermarket. Whilst the policy contains no retail proposals, the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+1
G) Meeting housing needs	The site is currently separate from the existing built extent at Cullompton, however this has been addressed by ensuring that it is brought forward in a phased manner with the adjoining preferred option CU1 North West Cullompton, a positive effect. The mix of	+3

	dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. Option provides for 400 new dwellings of which 35% should be affordable a contribution towards future housing need, a significant positive effect.	
H) Ensuring community health and wellbeing	Option will have an impact on Cullompton Air Quality Management area which will require some mitigation. There could also be light and noise pollution from developing the site. Therefore criteria within the policy seek mitigation measures through environmental protection and enhancement, carbon reduction and air quality, which is considered to be a positive effect. The option will contribute towards the provision of open space, sport and recreation facilities. Development of this scale alongside North West Cullompton is likely to bring a bus service nearer to the site. Overall, it is considered that there are a variety of impacts, but overall the effect is considered to be neutral against this objective.	0
I) Delivering the necessary infrastructure	The policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements, for example, to M5 J28 before this site is developed. Access to the site could only be via CU1 'North West Cullompton', with the phasing set out in an accompanying strategy as stipulated by the policy.	+2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time of the site is approximately 7 years. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help meet the housing needs of the district. Development would be focussed as an extension to the second town in the district.

Summary of Recommendations

The final policy, is selected as an extension to CU1 'North West Cullompton' would be supplemented by a similar suite of detailed policies on the issues listed below.

1. Transport provision
2. Environmental protection and green infrastructure
3. Archaeological investigation and protection of listed buildings
4. Provision of Sustainable Urban Drainage (SUD)

5. Community facilities
6. Carbon reduction and air quality
7. Construction impact and the treatment of waste
8. Development brief for the site.

Policy CU3 Knowle Lane
Preferred Option

A site of 9.8 hectares at Knowle Lane is allocated for residential development, subject to; 235 dwellings (35% affordable), transport provision, Green Infrastructure, environmental improvements, Sustainable Urban Drainage (SUD), transport plans, two points of vehicular access, pedestrian links and air quality improvements.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is in close proximity to a number of protected trees (in the adjoining north eastern field). The Council will review existing species or habitats information held on previously allocated sites and will commission were necessary further site-specific evidence. The results will be used to update this sustainability appraisal accordingly. However, criteria have been included within the policy to seek measures to protect and strengthen trees, hedgerows and other environmental features which contribute to the character and biodiversity, maintaining a wildlife network within the site and linking to the surrounding countryside. This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site can be viewed from Knowle Lane (to the south) and Ponsford Lane to the north. The land rises to the west, though there are few public viewing points. Housing to the east would provide a level of mitigation, though does extend the built environment into the countryside. Overall, the site is relatively well contained within the landscape, and impacts are not likely to be significant. Overall, the mitigation measures will reduce much of the impact, and therefore only a slight negative impact has been assumed.	-1
B) Protection and promotion of a quality built and historic environment	The site lies to the west of the Roman fort (a Scheduled Monument) and to the south of a possible road leading west from the fort. A geophysical survey undertaken in support of a planning application for this area identified anomalies within the proposed development site that may represent archaeological features, some of which may be indicative of industrial activity. In the light of the results of the geophysical survey and the presence of prehistoric as well as 18/19th century industrial activity recorded to the east in the adjacent development site, any groundworks associated with the development of this area have the potential to expose and destroy archaeological deposits associated with the known archaeological activity in the vicinity. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required. Given the recent findings above a slight negative effect is considered.	-1

C) Mitigating the effects of climate change	9.5ha (77% north and south parts) of the site lies within Flood zone 1 with the remaining 2.8ha (23% through centre of site, from east to west) within Flood zone 2 and 3. The site is therefore largely outside the highest areas of flood risk although a portion does fall within flood zones 2 & 3. Criteria within the policy however seek retention of land in the floodplain as informal amenity open space and the provision of a sustainable urban drainage scheme to deal with surface water from the development and arrangements for future maintenance, with a neutral effect therefore anticipated. Energy use in buildings account for nearly half of emissions of carbon dioxide, with more than a quarter coming from the energy used to heat, light and run homes. Criteria within the policy seek transport plans, carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, which overall should address potential negative impacts. Taking into account flood risk and mitigation measures for climate change an overall neutral impact is considered.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land, which would be lost if this site is developed, a negative effect. 3.3ha (27% N and S) of the site is located on Grade 1 high quality agricultural land and 9ha (73% central strip of site running east to west) of the site is located on Grade 4 poor quality agricultural land. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. The loss of any grade 1 land is considered to be a negative effect, given its scarcity in the district.	-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect. Development of this scale may be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	Option is located within walking distance to the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+1
G) Meeting housing needs	Option is well related to the existing built form at Cullompton, a positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. The option provides for 235 new dwellings of which 35% should be affordable a contribution towards future housing need, a significant positive effect.	+3
H) Ensuring community health and wellbeing	Criteria with the policy seek the provision of 2.7 hectares of Green Infrastructure, to include the retention of land in the floodplain as informal amenity open space; as well as provision of appropriate links to the adjacent development to the east of the site, a slight positive effect. Development at this site will have an impact on Cullompton Air Quality Management area, and could contribute towards noise and light pollution. However, mitigation measures have been proposed within the policy which should address some of these concerns. Overall, given the positive impacts of providing green infrastructure and public open space, and the potential negative impacts of other effects, a neutral score has been assumed.	0
I) Delivering the necessary infrastructure	Criteria within the policy seek at least two access points to the site from adjoining development not from Ponsford Lane, a slightly positive effect on the local road network. The policy requires appropriate links to adjoining development, and the provision of cycle and pedestrian links. The site may impact on the capacity of J28 of the M5. However, the Highways Agency have lifted their holding direction on already allocated sites within Cullompton now that improvements works to the junction have now been agreed with Devon County Council. Overall, the policy ensures sufficient level of infrastructure is upgraded to account for the site. A slight positive impact.	+1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time of the site is approximately 5 years. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help meet the housing needs of the district. Development would be focussed as an extension to the second town in the district.

Summary of Recommendations

1. No recommendations following SA.

Policy CU4 Land South of Tiverton Road

Option

A site of 1.9 hectares south of Tiverton Road could be allocated for residential development, subject to; 45 dwellings (35% affordable), a road linking Tiverton Road to Willand Road (a requirement under policy CU1 'North West Cullompton), archaeological investigation, transport plan, air quality improvements and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is fairly enclosed by hedgerows and the land at the bottom of the site rises, with the land beyond rising further. The site at present is viewable from some low distant ridges in the west, and developing it would raise the prominence of the built environment to the west of Cullompton. However, this will be mitigation by the adjacent allocations once built out. Given the small size of the site, its low visibility and mitigation of by the adjacent allocated sites, a neutral effect is anticipated. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	The St. Andrew's Hill roman fort (a scheduled ancient monument) lies to the east. The site lies in an area of archaeological potential to the west of the Roman fort at St Andrew's Hill and in an area where Roman finds have been recorded. Given the archaeological potential of the site, any planning application for development here must be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of any development upon it. Criteria within the policy seek archaeological investigation and mitigation, which should reduce the impact. Until the	-1

	Council these investigations have taken place, a slight negative impact has been assumed.	
C) Mitigating the effects of climate change	Site is located within flood zone 1. Criteria within the policy seek the provision of a sustainable urban drainage scheme to deal with surface water from the development and arrangements for future maintenance, a neutral effect is considered.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. Option would result in the loss of Grade 1 high quality agricultural land, a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Therefore, a negative impact of developing the site has been assumed, despite the small size of the site.	-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1
G) Meeting housing needs	Option is not currently well related to the existing built form at Cullompton, but could form an extension to other adjacent sites once they are built out. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. Option provides for 45 new dwellings of which 35% should be affordable - a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Site option does not result in the loss or gain of community facilities or open space, a neutral effect. The option will have an impact on Cullompton Air Quality Management area which will require some mitigation, whilst there could be light and noise pollution impacts. The policy requires implementation of a transport plan and other measures to minimise air quality impacts.	0
I) Delivering the necessary infrastructure	The site has no suitable access to the highway, and the existing roads are not ideal at present as they are constricted, a negative effect. Widening of existing adjacent roads would be necessary. There are issues with Tiverton Road, however an adequate site access is achievable. The policy has been written so that development should only come forward once local infrastructure being delivered by an adjacent site is compelted. Given this inclusion, there is not considered to be a negative impact on local infrastructure.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The impact of this site is likely to be medium-long term, given it cannot come forward before local infrastructure has been completed. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Summary of Recommendations

1. Renewable and low carbon energy will be expected to provide a proportion of the sites energy use.
2. Measures to mitigate construction impact and the treatment of waste.

Policy CU5 Ware Park and Footlands

Option

A site of 2.1 hectares at Ware Park and Footlands could be allocated for residential development, subject to; 38 dwellings (35% affordable), access from the Knowle Lane development, archaeological investigation, transport plan, air quality improvements and provision of a Sustainable Urban Drainage scheme (SUDs).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is flat, and bounded by established hedgerows. These screen the site from views from the south, whilst the adjacent site to be developed at the north will mitigate views from the north. Given these factors it is not considered that there will be a very limited landscape and visual impact. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. Overall, a neutral impact is considered.	0
B) Protection and promotion of a quality built and historic environment	A geophysical survey undertaken in support of a planning application for this area identified anomalies within the proposed development site that may represent archaeological features, some of which may be indicative of industrial activity. In the light of the results of the geophysical survey and the presence of prehistoric as well as 18/19th century industrial activity recorded to the east in the adjacent development site, any groundworks associated with the development of this area have the potential to expose and destroy archaeological deposits associated with the known archaeological activity in the vicinity. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required. Until further investigation provides more information, a slight negative effect must be assumed.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 which has the lowest probability of flooding. However, a stream runs to the north, and the impact may need to be considered via a flood risk assessment. Criteria within the policy seek the provision of a sustainable urban drainage scheme to deal with surface water from the development and arrangements for future maintenance; overall, a neutral effect is considered.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed, a negative effect. The option would result in the loss of a small area of 0.7ha (33% SE) grade 1 high quality agricultural land and 1.4ha (67% NW) Grade 4 poor quality agricultural land, a slight negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of	-1

	the district, hence the overall negative score.	
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street could benefit from the custom of the residents from this development. There would be a slight positive effect.	+1
G) Meeting housing needs	Option is not well related to the current built extent of the town though it would form a natural extension to the Knowle Lane site. The option provides for 38 new dwellings of which 35% should be affordable a contribution towards future housing need, a positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. Given the contribution to housing need an overall large positive effect is considered.	+2
H) Ensuring community health and wellbeing	Site option does not result in the loss or gain of community facilities or open space, a neutral effect. There could be an impact on Cullompton Air Quality Management area which will require some mitigation. The option will contribute towards light and noise pollution, a slight negative effect. The policy requires the implementation of a transport plan and measures to mitigate air quality impacts. Given this is a small site, a slight negative impact has been assumed.	-1
I) Delivering the necessary infrastructure	Development of this site would depend upon delivery of the existing Knowle Lane allocation. Knowle Lane itself, by reason of its width and alignment, is unsuitable to accommodate addition traffic, but if the existing allocated site is developed first then access will be sought through that site, given the limitations of Tiverton Road. Overall, therefore, the impact on infrastructure is considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The site is only likely to come forward once Knowle Lane is built out, the impact is likely to be medium-long term. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Summary of Recommendations

1. Renewable and low carbon energy will be expected to provide a proportion of the sites energy use.
2. Provision of a flood risk assessment given the proximity of a stream in close proximity to the site
3. Measures to mitigate construction impact and the treatment of waste.

Policy CU6 Court Farm
Preferred Option

A site of 1.4 hectares at Court Farm is allocated for residential development, subject to; 35 dwellings (35% affordable), transport plan, air quality improvements and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The remaining area is largely surrounded by existing development, visual and landscape impacts are considered minimal, a neutral effect. Much of the remaining area is previously developed, so impacts on biodiversity are expected to also be minimal. However, the Council will review existing species or habitats information held on previously allocated sites and will commission were necessary further site-specific evidence. The results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	There are no listed buildings within or adjoining the site. The Cullompton Conservation Area adjoins the site to the south but there is no anticipated impact, a neutral effect. This site has already been subject to a programme of archaeological investigation and no further work is required on this site, a further neutral effect. Most of the site is comprised of existing commercial buildings, in various states of use and repair. Redeveloping the site offers the opportunity to improve the local built environment. Therefore a positive impact is assumed.	+2
C) Mitigating the effects of climate change	The river and floodplain to the north of the site while this remaining part of the larger allocation is located in flood zone 1 the lowest probability of flooding, a neutral effect (particularly as the policy includes SUDs provision).	0
D) Safeguarding and minimising resource use	0.2ha is contaminated land as a result of textile manufacturing, whilst 0.4ha is from factory work. Developing the site would require the remediation of the soil, which is considered to be a positive impact. The site is located on previously developed land and will not result in the loss of greenfield sites, which is also considered a positive effect.	+2
E) Promoting economic growth and employment	Redeveloping the site will result in the loss of a small number of employment units within the south west corner of the site, a negative effect. These are units which are used, but not of the highest quality. A minor negative impact is therefore associated with their loss.	-1
F) Supporting retail	The site is located close to the town centre and Tesco supermarket. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a small positive effect.	+1
G) Meeting housing needs	Option is well related to the existing built form being located within an existing built up area - positive effect. The option provides for 35 new dwellings of which 35% should be affordable a contribution towards future housing need, a further significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+2
H) Ensuring community health and wellbeing	The site is located close to the town centre, a medical centre and Tesco superstore and there is pedestrian and cycle access to the site from Willand Road, a positive effect. Site option does not result in the loss or gain of community facilities or open space, a neutral effect. Developing the site could have an impact on Cullompton Air Quality Management area which will require some mitigation, as set out in the policy. Given the positive effect of the sites location near to local facilities and application of	+1

	mitigation, an overall positive impact has been assumed.	
I) Delivering the necessary infrastructure	There is an existing access, however the multiple landowners would need to come forward together to see this delivered. This could hamper efforts to bring the site forward. Potentially a negative effect.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Advice given to the Council suggests this site could take time to come forward, therefore the temporal impacts are likely to be medium to long-term. Once built the effects are permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Summary of Recommendations

1. Renewable and low carbon energy will be expected to provide a proportion of the sites energy use.
2. Measures to mitigate construction impact and the treatment of waste.
3. Remediation of contaminated land within the site.

Policy CU7 Land at Exeter Road
Preferred Option

A site of 1.4 hectares at Exeter Road could be allocated for residential development, subject to; 35 dwellings (35% affordable), archaeological investigation, transport plan, air quality improvements and Sustainable Urban Drainage scheme (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There is an important oak tree on the boundary with the road (covered with a temporary Tree Preservation Order). The Council will review existing species or habitats information held on previously allocated sites and will commission were necessary further site-specific evidence. The results will be used to update this sustainability appraisal accordingly. The site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The site is highly visible from B3181 a negative effect, further south there is dense tree cover which should screen wider views. Views into the site are generally short, a	-1

	neutral effect. Development of the site does extend the built nature of Cullompton further to the south. Given there will be some visual impact, an overall negative effect is considered.	
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential with regard to known prehistoric and Roman activity in the vicinity. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required. Criteria within the policy seek mitigation measures through archaeological investigation, a slight negative effect.	-1
C) Mitigating the effects of climate change	The Cole Brook runs to the north of the site on the opposite side of Exeter Road and a flood risk assessment may therefore be required to determine any potential impact. The site is located in flood zone 1 the lowest probability of flooding, and the policy requires the inclusion of a sustainable urban drainage scheme, therefore a neutral effect is anticipated.	0
D) Safeguarding and minimising resource use	Development option consists of some residential land as well as a limited amount of greenfield (which is grade 3 agricultural land). The loss of this land is considered to be a minor negative effect of developing the site.	-1
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street and other local retail could benefit from the custom of the residents from this development. There would be a slight positive effect.	+1
G) Meeting housing needs	Option provides for 35 new dwellings of which 35% should be affordable a contribution towards future housing need, a large positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+2
H) Ensuring community health and wellbeing	The site is located 800 metres from the town centre, but closer to local shopping, leisure and school provision. The site has access to a footpath along the road into Cullompton. Option will have an impact on Cullompton Air Quality Management area which will require some mitigation. Overall therefore, a neutral impact is considered.	0
I) Delivering the necessary infrastructure	The site has a possible conflict with access to hospital (on opposite sides of the road) that will need addressing. There are two possible access options to the site, either through Swalcliffe site (the most northerly house), or jointly through Springbourne (the southerly house) in combination with the adjoining agricultural land. The site adjoins the good bus route along Exeter Road although there is no stop immediately adjacent the site. Overall a neutral effect.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The estimated development time for this site is two years, and could come forward in the short term. Once developed, its impact will be permanent.

Spatial extent: (District wide / local)	This site option will help meet the housing needs within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Summary of Recommendations

1. Renewable and low carbon energy will be expected to provide a proportion of the sites energy use.
2. Measures to mitigate construction impact and the treatment of waste.

Policy CU8 Bradninch Road

Option

A site of 1.1 hectares at Bradninch Road could be allocated for residential development, subject to; 25 dwellings (35% affordable), access from Exeter Road, archaeological investigation, transport plan, air quality improvements and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This sites falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The site slopes steeply and development would be very prominent, with large potential for visual impact. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential with regard to known prehistoric and Roman activity in the vicinity. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded condition on any consent granted may be required. Criteria within the policy seek mitigation measures through archaeological investigation – however the potential for a slight negative effect exists.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest probability of flooding, however, given the steeply sloping nature of the site there is the potential for surface water run-off to cause impacts elsewhere. The policy does include sustainable urban drainage to mitigate any impact, therefore a neutral effect is anticipated.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed, a negative effect. Option would result in the loss of grade 3 good to moderate quality agricultural land, a slight negative effect.	-1
E) Promoting economic growth	Site option does not result in the loss or gain of employment land, a neutral effect.	0

and employment		
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1
G) Meeting housing needs	Option provides for 35 new dwellings of which 35% should be affordable a contribution towards future housing need, a large positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+2
H) Ensuring community health and wellbeing	The site is located 800 metres from the town centre. Option will have an impact on Cullompton Air Quality Management area which will require some mitigation. The neighbouring use to the site is housing but at a lower level, therefore there may be some issues with overlooking. A frequent bus service is available nearby. Considering all impacts, a balanced (and therefore neutral) impact is considered.	0
I) Delivering the necessary infrastructure	Access to the site would only be possible through land at Exeter Road site CU7, which has access difficulties. Overall a slight negative effect is possible.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The estimated development time for this site is two years, and it could come forward in the short term. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Summary of Recommendations

1. Renewable and low carbon energy will be expected to provide a proportion of the sites energy use.
2. Measures to mitigate construction impact and the treatment of waste.
3. Development should reduce opportunities for overlooking of any adjacent residential properties

Policy CU9 Land at Colebrook

Option

A site of 16.6 hectares could be allocated for residential development, subject to; 300 dwellings (35% affordable), no development until road linking Tiverton Road to Willand Road is approved, two points of access from Siskins Chase and upgrading of Colebrook Lane to accommodate additional traffic, 2.7 ha of green

infrastructure and retention of the land in the flood plain for open space, environmental measures, archaeological investigation, transport plan, air quality improvements and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The central band of the site falls within the 'Sparsely settled farmed valley floors' landscape character area. This area is typified by the presence of rivers or streams and related flat or gently sloping valley bottoms within the low lying areas of the district. The north and south portions of the site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is reasonably enclosed closer to Colebrook Lane, and is part of a rolling landscape. There is limited wider landscape impact, but a more localised impact if the site is developed. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. Criteria within the policy seek measures to protect and strengthen environmental features which contribute towards the character and biodiversity of the surrounding countryside and mitigation through 2.7ha of green infrastructure including the protection of amenity local space. Given the mitigation measures but localised impact a slight negative effect is considered.	-1
B) Protection and promotion of a quality built and historic environment	This site occupies a large area in a landscape with evidence of prehistoric and Roman activity in the vicinity. Any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it. Criteria within the policy seek mitigation measures through archaeological investigation but there is the potential for a slight negative effect.	-1
C) Mitigating the effects of climate change	Kia Ora Farm and fishing lakes to west of site. The Cole Brook runs from the east, circling the bottom half of site, and then parallel to boundary (on south east side). 16.7ha (87%) of the site falls within flood zone 1 with the remaining 3 1.6ha (8%, following Cole Brook) in flood zone 2 & 3 and 1ha (5%, following Cole Brook) in the functional floodplain. Criteria within the policy seek mitigation measures through retention of land in the floodplain as informal amenity open space and the provision of sustainable urban drainage schemes to deal with surface water run-off. Given the mitigation measures within criteria within the policy a neutral effect is considered. Energy use in buildings account for nearly half of emissions of carbon dioxide, with more than a quarter coming from the energy used to heat, light and run homes. Criteria within the policy seek carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, a slight positive effect. Taking into account flood risk and mitigation measures for climate change an overall slight positive effect is considered.	+1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed, a negative effect. Option would result in the loss of 0.2ha (1% N) of grade 1 excellent quality agricultural land, 14.8ha (77% SE) of grade 2 very good agricultural land and 4.3ha (22% SW) of grade 3 good to moderate quality agricultural land, a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Only 11% of land within the district is grade 2.	-2
E) Promoting economic growth	Site option does not result in the loss or gain of employment land, a neutral effect. Development of this scale may be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There	+1

and employment	would therefore be some positive impact.	
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street could benefit from the custom of the residents from this development. There would be a slight positive effect.	+1
G) Meeting housing needs	Option provides for 300 new dwellings of which 35% should be affordable a contribution towards future housing need, a significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+3
H) Ensuring community health and wellbeing	The site is located some distance from the town centre. The option will have an impact on Cullompton Air Quality Management area which will require some mitigation (which has been included within the policy). The option could contribute towards light and noise pollution, a slight negative effect. The site includes 2.7ha of informal open space, allowing opportunities for outdoor play. Balancing all factors, a slight negative impact has been assumed.	-1
I) Delivering the necessary infrastructure	The width of Colebrook Lane from Swallow Way may present difficulties with access and would need to be substantially upgraded. Development in this location would increase traffic on Tiverton Road, so would not be permissible until a new road linking Tiverton Road to Willand Road has been provided under Policy CU1. Criteria within the policy state that Colebrook Lane should be upgraded to accommodate additional traffic arising from the development and provision of two points of access from Siskins Close. Further mitigation criteria within the policy state that no development should occur until the Eastern Relief Road has been provided. Given the mitigation measures set out in criteria within the policy and the fact that infrastructure would need to be in place prior to development beginning, an overall neutral impact has been assumed.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. However, as the site could only come forward once the Eastern Relief Road is in place, development is only likely to take place in the medium-long term. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help meet the housing needs of the district. Development would be focussed as an extension to the second town in the district.

Summary of Recommendations

1. Renewable and low carbon energy will be expected to provide a proportion of the sites energy use.
2. Measures to mitigate construction impact and the treatment of waste.
3. Opportunity to include a local centre within the site.

Policy CU10 Land at East of Culm Farm

Option

A site of 5.31 hectares at East Culm Farm could be allocated for residential development, subject to; 120 dwellings (35% affordable), improved pedestrian and cycle links, retention of floodplain as green infrastructure and amenity open space, archaeological investigation, transport plan, air quality improvements and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Most of the site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. A small sliver of land in the north west of the site falls within the 'Sparsely settled farmed valley floors' landscape character area. This area is typified by the presence of rivers or streams and related flat or gently sloping valley bottoms within the low lying areas of the district. The site is mostly flat and surrounded by high hedges, which largely screens it from views from the south and west. The impact of having housing on the site is likely to be no more effect than the existing glasshouse use on the landscape, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	The proposed development site lies in a landscape where prehistoric and Roman activity is recorded in the Historic Environment Record. The northern part of the site has probably been disturbed by the construction of the greenhouses, but the southern part still has potential for containing archaeological deposits. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required. Criteria within the policy seek mitigation measures through archaeological investigation, a slight negative effect. The site is partly occupied with a large number of derelict glasshouses and associated buildings and infrastructure. Redevelopment of the site would be a positive effect, as otherwise, the site is likely to deteriorate further, with potential negative impacts on the neighbouring residential properties. Therefore, an overall positive impact has been assumed.	+2
C) Mitigating the effects of climate change	The floodplain of the River Culm lies to the west of the site. 5.3ha of the site falls within flood zone 1 the lowest probability of flood risk with the remaining 0.6ha (10% of site, western portion) part of the site falling within flood zone 2. Criteria within the policy seek mitigation measures through retention of land in the floodplain as informal amenity open space and the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off. Given the mitigation measures within criteria within the policy a neutral effect is considered, given that the policy specifies the retention of land within the floodplain. Energy use in buildings account for nearly half of emissions of carbon dioxide, with more than a quarter coming from the energy used to heat, light and run homes. Criteria within the policy seek carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, a positive effect. Taking into account flood risk and mitigation measures for climate change an overall slight positive effect is considered.	+1
D) Safeguarding and minimising	Development option is located on greenfield land to the south and horticultural land (the glass houses) to the north of the site. Loss of the greenfield land would be a negative impact; the glasshouses land, while not technically brownfield land, has existing buildings on site, and therefore the impact of redeveloping it would be positive, as the site has been derelict for a number of	0

resource use	years. Of the greenfield land the option would result in the loss of 1.5ha (25% east) of grade 1 excellent quality agricultural land and 4.4ha (75% to the west) of grade 4 poor quality agricultural land, a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Overall, there are positive and negative impacts, therefore a neutral effect has been assumed.	
E) Promoting economic growth and employment	Though the site has previously been used for horticulture, this is not technically classed as employment land. Neither has any employment activity taken place on the site for the last ten years. Therefore, no impact has been assumed for employment.	0
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals. No impact.	0
G) Meeting housing needs	Option provides for 120 new dwellings of which 35% should be affordable a contribution towards future housing need, a significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+2
H) Ensuring community health and wellbeing	The site is located some distance from the town centre and remote from Cullompton town services/facilities. The option will have an impact on Cullompton Air Quality Management area which will require some mitigation. The site is in very close proximity to the motorway, the noise from which may negatively impact on residential amenity, a negative effect. Given the impact from the motorway, and separate from the main element of the town, an overall negative impact has been assumed.	-2
I) Delivering the necessary infrastructure	The north section of the site is the subject of a current planning application (now granted) where access could achieved, although junction capacity may be an issue. There is a bus service between one and four journeys per day available on the A373. Criteria within the policy seek the provision of a pedestrian and cycle link to the town centre across the motorway and implementation of a transport plan. There may be capacity issues with the M5 from allocating further development on the east side of the motorway (hence the negative overall score) and more information will be required from the Highways Agency before a site can be allocated. Delivery of the site could be brought forward in conjunction with the strategic East Cullompton Site (CU11), and the infrastructure requirements will change if that option is pursued. Its scoring therefore, reflects it coming forward as a sole site at present.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Part of the site now has planning permission and could come forward in the short term.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Summary of Recommendations

1. Appropriate noise mitigation and sound proofing to minimise the impact of the adjacent motorway
2. Renewable and low carbon energy will be expected to provide a proportion of the sites energy use.
3. Measures to mitigate construction impact and the treatment of waste.

Policy CU11 East Cullompton Urban Extension Option

A site of 200 hectares to the east of Cullompton could be allocated for mixed use development, subject to; 3,000 dwellings (35% affordable), 54,000 square metres of mixed commercial floor space, 50 ha of green infrastructure comprising mixed open space, sports pitches, allotments and natural habitats, improvements to junction 28 of the M5 and pedestrian and cycle links to the town centre, environmental protection, community facilities, air quality improvements, phasing strategy and masterplanning.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There is a 1 ha unclassified wildlife site close to the western edge of the proposed urban extension, a slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is large and predominantly flat. The landscape of the surrounding area is also largely flat, offering limited views into the site. However, given the scale of the site, and there may well be variations in topography, and if the site were to be put through, a full Landscape and Visual Impact Assessment would need to be undertaken to determine impacts. Criteria within the policy seek mitigation measures through environmental protection and enhancement and provision of 50 ha of strategic green infrastructure comprising a mix of public open space, sports pitches, allotments and natural habitats, a positive effect. Given the scale of the site and need for a full landscape and visual impact assessment an uncertain effect is considered.	?
B) Protection and promotion of a quality built and historic environment	This site occupies a significant area within a landscape that has evidence of prehistoric and Roman activity recorded in the County Historic Environment Record. To the west, recent archaeological work has demonstrated the presence of prehistoric and Roman settlement in and around Cullompton. While no such sites are recorded within the area under consideration (though this may just reflect the absence of any formal archaeological work in this area) the Historic Environment Team would regard, due to the area of the proposed allocation and the known prehistoric and Roman activity in the wider landscape, that there is potential for the site contain archaeological deposits associated with the known prehistoric and Roman activity in the vicinity. The Historic Environment Team would therefore advise that any planning application for the development of this area should be supported by the results of an appropriate programme of archaeological work to allow the archaeological potential of the site to be understood along with the	+1

	impact of any development upon the heritage assets in the site. This would be in accordance with Local and National Policy on planning and the historic environment. Criteria within the policy seek mitigation measures through environmental protection and enhancement, but there is the potential for negative impacts on heritage until more information is known. The policy requires a public masterplanning exercise to be undertaken before any planning application is made to ensure the quality of the final design of the development, which is considered to be a large positive impact. Overall, therefore, a small positive impact has been assumed.	
C) Mitigating the effects of climate change	Approximately 10% of site in these zones, primarily through the centre of the site and in the north west and east of the site lies within Flood zones 2 and 3, a negative effect. Criteria within the policy seek mitigation measures through retention of land in the floodplain as informal amenity open space. Given the mitigation measures within criteria within the policy a neutral effect is considered. Energy use in buildings account for nearly half of emissions of carbon dioxide, with more than a quarter coming from the energy used to heat, light and run homes. Criteria within the policy seek carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, a slight positive effect. Taking into account flood risk and mitigation measures for climate change an overall slight positive effect is considered.	+1
D) Safeguarding and minimising resource use	Development option is located largely on greenfield land although there are a number of farms within the site and approximately 8.4ha of contaminated land located in the western side of the site. Option would result in the loss of 63.2ha (west) of Grade 1 excellent quality agricultural land, 131.2ha (east) of grade 3 good to moderate quality agricultural land and 6.7ha (west) Grade 4 poor quality agricultural land, a significant negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of a significant amount of Grade 1 agricultural land an overal significant negative effect is considered.	-3
E) Promoting economic growth and employment	There are a number of farms on which a small number of B class employment units are situated. These could be incorporated into the site, or replaced with other employment units as part of a mixed use approach for the whole site. The policy seeks the provision of 54,000 square metres of mixed commercial floor space bringing with it a large number of jobs into the town a significant positive effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+3
F) Supporting retail	Option is located some distance from the town centre. The policy seeks the provision of 54,000 square metres of mixed commercial floor space including retail, bringing with it a large number of jobs into the town. Criteria in the policy state that this is subject to impact assessment which demonstrates no adverse impacts on existing retail uses within Cullompton Town Centre, an overall positive effect.	+2
G) Meeting housing needs	Option provides for 3,000 new dwellings of which 35% should be affordable a contribution towards future housing need, a significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. Given the site is of such a scale to generate a critical mass of self-sustaining development and the option significantly contributes towards housing development an overall significant positive effect is considered.	+3
H) Ensuring community health and wellbeing	The site is located some distance from the town centre and remote from Cullompton town services/facilities. Criteria within the policy seek provision of a dedicated pedestrian and cycle route to the town centre. Option will have an impact on Cullompton Air Quality Management area which will require some mitigation. Option will contribute towards light and noise pollution, a slight	0

	negative effect. The western portion of the site is in very close proximity to the motorway, the noise from which may negatively impact on residential amenity, a negative effect. The nearest primary school has limited spare capacity to support future development and is on a constrained site and not easily expanded. A development of this scale is likely to generate approximately 1200 primary age pupils, requiring the provision of new primary school provision within the development site. Potentially, this would require two sites of 2.9ha each (including nursery provision). Secondary school is at capacity and will need to be expanded to support increased children in and around area. Criteria within the policy seek community facilities to meet local needs arising from the development, a neutral effect. In balancing the distance of the development from the town centre and the severance caused by the M5 motorway, alongside the corresponding light, noise and air pollution as well as education requirements against proposed mitigation measures an overall neutral effect is considered.	
I) Delivering the necessary infrastructure	The policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements, for example, to M5 J28 before this site is developed. There are no local facilities on the east side of the M5 and a development in this location and of the size proposed would have significant implications for the operation of J28 and the M5 mainline. The junction already operates at capacity at times with queues on the off-slips extending back onto the M5 mainline. This causes serious road safety concerns. Devon County Council is currently working towards an improvement aimed at accommodating current growth proposals as set out in the Core Strategy. Further improvement would be needed to the junction to accommodate traffic arising from the SHLAA proposal and are very likely to be significant in scale, i.e. a second over bridge. Consideration would also have to be given to the ability of the M5 mainline to accommodate the forecast traffic flows and measures identified, if necessary, to ensure that demand for traffic movements along the M5 remains within the capacity of the mainline to accommodate it. The Highways Agency has reservations about the impact on the strategic road network. The site is of a sufficient scale for infrastructure improvements to be necessary within and outside of the site. Criteria within the policy seek transport provision to ensure appropriate accessibility for all modes, improvements to Junction 28 of the M5 motorway and provision of a dedicated pedestrian and cycle route to the town centre. Option will support the provision of 50 ha Green Infrastructure through criteria within the policy which is considered to be a positive effect. Given the capacity limitations for junction 28 of the M5; traffic implications for the Honiton Road and lead in time for delivery of a large urban extension against proposed mitigation measures an uncertain effect is considered until appropriate studies / modelling work can confirm that access can be achieved and suitable junctions designed. The size of the development would also need considerable planning and design works and criteria within the policy seek a phasing strategy and public masterplanning exercise.	?

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15	Development will occur during the later period of the plan, and then will continue throughout the remaining lifetime , (therefore likely to only be taking place in the long-term). Once developed, the effects will be permanent.

years) Long (15+ years)	
Spatial extent: (District wide / local)	The policy set seek to meet the development needs of the whole district.

Summary of Recommendations

The final policy would be supplemented by a suite of detailed policies on the issues listed below:

9. Transport provision
10. Environmental protection and green infrastructure
11. Landscape and Visual Impact Assessment
12. Archaeological investigation & protection of listed buildings
13. Flood mitigation & Sustainable Urban Drainage (SUD)
14. Community facilities
15. Carbon reduction & air quality
16. Construction impact and the treatment of waste
17. Masterplanning & phasing

Policy CU12 Week Farm
Preferred Option

A site of 10.7 hectares at Week Farm is allocated for employment development, subject to; 15,000 sq metres of employment floorspace within use classes B2 & B8, vehicular link from the Kingsmill employment area to Honiton Road, development should not to commence until the completion of the necessary improvements to M5 Junction 28, Sustainable Urban Drainage (SUD), 2 ha of green infrastructure including the retention of land in the flood plain and protection of existing public rights of way.

Sustainability objective	Commentary	Impact
A) Protection of	The site is visible from the far ridge to the east and west. The site falls within the 'Lowland plains' landscape character area and is	-1

the natural environment	typified as being an open, low lying flat landscape which is agriculturally prosperous. Given the site is located in an area less sensitivity to change and development only a slight negative effect is considered. The Council will review existing species or habitats information held on previously allocated sites and will commission were necessary further site-specific evidence. The results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	This site lies within a landscape that has evidence of prehistoric and Roman activity recorded in the County Historic Environment Record. To the west, recent archaeological work has demonstrated the presence of prehistoric and Roman settlement in and around Cullompton. While no such sites are recorded within the area under consideration (though this may just reflect the absence of any formal archaeological work in this area) the Historic Environment Team would regard there to be potential for the site contain archaeological deposits associated with the known prehistoric and Roman activity in the vicinity. The Historic Environment Team would therefore advise that any planning application for the development of this site should be supported by the results of an appropriate programme of archaeological work to allow the archaeological potential of the site to be understood along with the impact of any development upon the heritage assets in the site. There is the potential therefore for a slight negative impact as a result.	-1
C) Mitigating the effects of climate change	The site is bounded to the west by the River Ken and its associated floodplain. Development of the area of floodplain should be avoided. 8.7ha (east) of the site is located in Flood zone 1 the lowest probability of flooding with the remaining 2ha (west) in Flood Zone 2 and 1.4ha (east) within Flood zone 3. Criteria within the policy seek the provision of Sustainable Urban Drainage Scheme to deal with surface water from the development and future maintenance and the retention of 2 ha of green infrastructure to include the retention of land in the flood plain, a neutral effect is considered.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed, a negative effect. Option would result in the loss of 5.4ha (east) of Grade 1 excellent quality agricultural land, 2.8ha (north) of Grade 3 good to moderate quality agricultural land and 2.5ha (west) Grade 4 poor quality agricultural land, a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district.	-2
E) Promoting economic growth and employment	Proposed policy will help deliver 15,000 square meters of employment floorspace within use classes B2 and B8 that will contribute towards bringing jobs into the area, a significant positive effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+3
F) Supporting retail	Site option does not result in the loss or gain of retail land, a neutral effect.	0
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0
H) Ensuring community health and wellbeing	The site is located some distance from the main part of Cullompton, potentially reducing opportunities for walking to work. However, given the scheme is to permit heavier industries such as B2 and B8 uses, the location, adjacent to existing employment land is appropriate. The policy also requires the protection and enhancement of the existing public rights of way. Development at this location could have an impact on air quality, particularly given the type of vehicles (i.e. HGVs) which would be associated with B2/B8 uses.	-1
I) Delivering the necessary	Highways Agency have a holding direction on significant development until improvements have been made to J28 of the M5. The policy requirement is for no development to commence until necessary improvement works to J28 (M5) have been completed.	0

infrastructure	There is potential access onto the site via Honiton Road, and Saunders Way through the existing adjoining serviced employment land. Adjoining land was allocated in a previous Local Plan and is serviced land, readily available for development. Criteria within the policy seek a vehicular link from Kingsmill employment area to Honiton Road, a positive effect. Given the capacity limitations for junction 28 of the M5 and traffic implications for the Honiton Road alongside proposed mitigation measures a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once developed, development will be permanent. The site could come forward in the short-medium term, given that improvements to J28 are due to take place in the near future.
Spatial extent: (District wide / local)	Development would be focussed in Cullompton, the second town in the district with good connections to the M5 strategic road corridor, but the employment here could have a wider draw across the district and beyond.

Summary of Recommendations

1. Any development here must be supported by the results of an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of any development upon it.
2. Mitigation measures to reduce air quality impacts

Policy CU13(A, B & C) Venn Farm, Land adj Venndale, NW Kingsmill Industrial Estate

Option

A site of 13.7 hectares comprised of three sites could be allocated for employment development, subject to; a suitable amount of floorspace (potential for 30,000 sq metres of employment floorspace), vehicular access, no development until necessary improvements to M5 Junction 28, Sustainable Urban Drainage (SUD), retaining of areas within flood plain and Green Infrastructure.

Sustainability	Commentary	Impact

objective		
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is flat and can only be viewed from very distant ridgelines, a slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential and within a floodplain of the River Culm. Ground disturbance in this area may expose archaeological and palaeo-environmental deposits, a slight negative effect. The Historic Environment Team would therefore advise that any planning application for the development of this site should be conditional upon an appropriate programme of archaeological work being undertaken in mitigation for the impact of the development upon the heritage assets that may be affected by development within the site.	-1
C) Mitigating the effects of climate change	Development in the area of floodplain should be avoided including 0.9ha (north) in the functional flood plain, 5.2ha northwest in flood zone 2 and 0.9ha (northwest) in flood zone 3. The remaining 8.5ha is located in flood zone 1 and should be the only area considered developable. Criteria within the policy seek the provision of sustainable urban drainage schemes to deal with all surface water the development and arrangement of future maintenance and the retention of area within the flood plain as green infrastructure, a neutral effect.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed, a negative effect. The option would result in the loss of 12.8ha of Grade 3 good to moderate quality agricultural land, a negative effect.	-2
E) Promoting economic growth and employment	Proposed policy will help deliver 30,000 square metres of employment floorspace that will contribute towards bringing jobs into the area, a significant positive effect. Criteria within the policy seek a suitable amount of employment floor space, a positive effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+3
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect.	0
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0
H) Ensuring community health and wellbeing	The site is located some distance from the main part of the town, which would reduce opportunities for walking to work. The option may have an impact on Cullompton Air Quality Management area which will require some mitigation not currently set out in a policy.	-2
I) Delivering the necessary infrastructure	There are capacity issues at J28 however improvement works are planned. Suitable highways access is unknown. Criteria within the state that the development cannot come forward until improvement works to J28 have taken place. This ensures no negative impacts on the local road infrastructure.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with

	consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once developed, development will be permanent. The site could come forward in the short-medium term, given that improvements to J28 are due to take place in the near future.
Spatial extent: (District wide / local)	Development would be focussed in Cullompton, the second town in the district with good connections to the M5 strategic road corridor, but the employment here could have a wider draw across the district and beyond.

Summary of Recommendations

1. The topography of the site would result in the need for sensitively located development. Introduce measures to protect and strengthen trees, hedgerows and other environmental features which contribute to the character and biodiversity, maintaining a wildlife network.
2. Any development here must be supported by the results of an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of any development upon it.
3. Inclusion of measures to mitigate air quality impacts

Policy CU13(D) NE Part of Kings Mill Option

A site of 3.3 hectares at Kings Mill Industrial Estate could be allocated for employment development, subject to; a suitable amount of floorspace (potential for 11550 sq metres of employment floorspace), vehicular access, no development until necessary improvements to M5 Junction 28, Sustainable Urban Drainage (SUD), retaining of areas within flood plain and Green Infrastructure.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. There is a view from the distant ridgeline to the east, a slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential. Ground disturbance in this area may therefore expose archaeological deposits, a slight negative effect. The Historic Environment Team would therefore advise that any planning application for the development of this site should be conditional upon an appropriate programme of archaeological work being undertaken in mitigation for the impact of the development upon the heritage assets that may be affected by development within the site.	-1

C) Mitigating the effects of climate change	The south east boundary of the site is adjacent to flood zone 2 and 3. Revised Environment Agency mapping may show more of the site in the floodplain. Criteria within the policy seek the provision of sustainable urban drainage schemes to deal with all surface water the development and arrangement of future maintenance, an overall neutral effect.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed, a negative effect. The option would result in the loss of 3.3ha of Grade 3 good to moderate quality agricultural land, a negative effect.	-2
E) Promoting economic growth and employment	This site has planning permission for B1, B2 and B8 uses, equating to 22,064 square metres of employment floorspace. One unit to the northwest (adjoining the site) has been built under a separate consent. Road access is in place but there are no serviced plots on the remaining land as yet. Proposed policy will help deliver 22,064 square meters of employment floorspace that will contribute towards bringing jobs into the area, a significant positive effect. Criteria within the policy seek a suitable amount of employment floor space, a positive effect.	+3
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect.	0
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0
H) Ensuring community health and wellbeing	The site is located some distance from the town centre but within walking distance of a bus route, a slight negative effect. Option will have an impact on Cullompton Air Quality Management area which will require some mitigation.	-1
I) Delivering the necessary infrastructure	There are capacity issues at J28 however improvement works are planned. Suitable highways access is unknown. Criteria within the state that the development cannot come forward until improvement works to J28 have taken place. This ensures no negative impacts on the local road infrastructure.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once developed, development will be permanent. The site could come forward in the short-medium term, given that improvements to J28 are due to take place in the near future.
Spatial extent: (District wide / local)	Development would be focussed in Cullompton, the second town in the district with good connections to the M5 strategic road corridor, but the employment here could have a wider draw across the district and beyond.

Summary of Recommendations

1. The topography of the site would result in the need for sensitively located development. Introduce measures to protect and strengthen trees, hedgerows and other environmental features which contribute to the character and biodiversity, maintaining a wildlife network.
2. Any development here must be supported by the results of an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of any development upon it.
3. Inclusion of measures to mitigate air quality impacts

Policy CU13(E) Land South of Springbourne, East of Exeter Road Option

A site of 1.7 hectares at land south of Springbourne could be allocated for employment development, subject to; a suitable amount of floorspace (potential for 5950 sq metres of employment floorspace), vehicular access, no development until necessary improvements to M5 Junction 28, Sustainable Urban Drainage (SUD), retaining of areas within flood plain and Green Infrastructure.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This sites falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The site slopes steeply from the west to the east and contains a number of mature trees around the edge of the site. The site overlooks an adjacent property and it broken up into two agricultural fields. The site can be viewed from the west and the east and has a high visual impact, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	There is no anticipated archaeological impact, a neutral effect.	0
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest probability of flooding, a neutral effect. Criteria within the policy seek the provision of sustainable urban drainage schemes to deal with all surface water the development and arrangement of future maintenance, an overall neutral effect.	0
D) Safeguarding and minimising	Development option is located on greenfield land which would be lost if this site is developed, a negative effect. Option would result in the loss of 1.7ha of Grade 3 good to moderate quality agricultural land, a slight negative effect.	-2

resource use		
E) Promoting economic growth and employment	Proposed policy will help deliver 5,900 square meters of employment floorspace that will contribute towards bringing jobs into the area, a positive effect. Criteria within the policy seek a suitable amount of employment floor space, a positive effect.	+2
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect.	0
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0
H) Ensuring community health and wellbeing	The site is located adjacent to the Cullompton Bowling Club however there is no anticipated loss of this facility, a neutral effect. The site does not have access to a designated foot/cycle path and is located some distance from the town centre, a slight negative effect. Option will have an impact on Cullompton Air Quality Management area which will require some mitigation, and there are concerns that certain types of employment in this location could draw additional HGVs through the town centre.	-2
I) Delivering the necessary infrastructure	Suitable highways access is unknown, hence inclusion of criteria within the policy which seek a suitable vehicular access, a neutral effect. The policy requires that the site cannot come forward until improvement works to J28 have been made, ensuring no short term impact on infrastructure as a result.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once developed, development will be permanent. The site could come forward in the short-medium term, given that improvements to J28 are due to take place in the near future.
Spatial extent: (District wide / local)	Development would be focussed in Cullompton, the second town in the district with good connections to the M5 strategic road corridor, but the employment here could have a wider draw across the district and beyond.

Summary of Recommendations

1. The topography of the site would result in the need for sensitively located development. Introduce measures to protect and strengthen trees, hedgerows and other environmental features which contribute to the character and biodiversity, maintaining a wildlife network.
2. Inclusion of measures to mitigate air quality impacts

3. Extension of the existing footpath along the B3181 to connect up to the site

Policy CU14 Eastern Relief Road
Preferred Option

An eastern relief road linking Station Road to Meadow Lane will be provided subject to; public consultation on its proposed route, provision of replacement open space and sporting facilities within the Cullompton Community Association Fields and elsewhere, footpaths and cycle ways, Sustainable Urban Drainage (SUD) & Environmental measures.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The Eastern Relief Road route will link Station Road to Meadow Lane via the Cullompton Community Association Fields. The route of the Relief road could lead to the severance of wildlife corridors and wildlife networks, a negative effect. Criteria within the policy seek measures to protect and strengthen trees, hedgerows and other environmental features which contribute to the character and biodiversity, maintain wildlife networks within the site and surrounding countryside, a positive effect. The site is also designated as a priority habitat, which may be negatively affected by the development, requiring mitigation or alternative provision.	-2
B) Protection and promotion of a quality built and historic environment	Site option does not impact positively or negatively on the quality of the built or historic environment, a neutral effect. The inclusion of a criterion within the policy for a public consultation exercise before the route is determined should help in the selection of the most appropriate design solution. Hence, a slight positive impact has been scored.	+1
C) Mitigating the effects of climate change	The proposed route of the Cullompton Eastern Relief Road crosses flood zone 3, a negative effect. Road infrastructure is classed as essential infrastructure and must pass the sequential test and exception test if in flood zone 3a or 3b. The sequential and exception tests are passed as Devon County Council confirms this is the only option that can deal with air quality within the town. Criteria within the policy seek the provision of sustainable urban drainage scheme to deal with all surface water from the development and arrangement for future maintenance, a positive effect. An overall neutral effect is considered.	0
D) Safeguarding and minimising resource use	The land is greenfield, with some used for sports and recreation purposes. The agricultural classification is grade 4, some of the lowest quality, and its loss is therefore considered only a slight negative impact.	-1
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect. The Eastern Relief Road is expected to provide traffic relief to the town centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business, a positive effect.	+2
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect. The Eastern Relief Road is expected to provide traffic relief to the town centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business, a positive effect.	+2
G) Meeting	Site option does not result in the loss or gain of residential land, a neutral effect	0

housing needs		
H) Ensuring community health and wellbeing	Cullompton is a declared Air Quality Management Area. It has an approved Air Quality Action Plan. The Action Plan identifies a number of measures to improve air quality, including the provision of a relief road. There are air quality problems through Nitrogen Dioxide in parts of Station Road, Higher Street and Fore Street. The source of this is road traffic. The completion of the relief road system with associated traffic management measures will reduce the level below those that have an adverse effect. In addition it will provide traffic relief to the Town Centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business. The evidence in 2010 concluded that a new road to the east of the town centre is essential if the objectives of traffic relief, air quality improvement and with it town centre enhancement, are to be achieved. The Eastern Relief Road is an integral part of the existing development strategy for Cullompton, designed to relieve traffic through the town centre in conjunction with a road through the North West Urban Extension to link Tiverton Road to Willand Road, a significant positive effect on air quality within the town centre. The Eastern Relief Road route will link Station Road to Meadow Lane via the Cullompton Community Association Fields. The construction of the road is likely to have an impact on the on the area of open space and recreation value, a negative effect. Careful consideration will therefore need to be taken in finalising the route and the aim will be to cause minimum impact on the CCA fields. Criteria within the policy seek provision of replacement open space and sporting facilities within Cullompton Community Association Fields or elsewhere in Cullompton, enhancement of the existing footpath to form a shared use foot and cycleway and a public consultation exercise before the route is determined. Given the potential for impact on the CCA fields but the proposed mitigation measures and significant improvements to air quality, an overall positive effect is considered.	+2
I) Delivering the necessary infrastructure	The Eastern Relief Road is an integral part of the existing development strategy for Cullompton, designed to relieve traffic through the town centre, a positive effect. The proposed route of the Eastern Relief Road will likely have an impact on the area of open space and recreation value (Green Infrastructure), a negative effect. Additional housing development has now taken place at Knowle Lane and Tiverton Road, contributing to Junction 28 improvements and funding for the Eastern Relief Road, but work on the Eastern Relief Road has not yet commenced. The delivery of the road depends upon the delivery of the North West urban extension (preferred option Policy CU1). The Council will also seek external sources of funding to pay for the road. Overall the Eastern Relief Road is a key piece of local infrastructure and its delivery will have a significant local impact.	+3

Secondary/cumulative/synergistic effects:	This policy supports many of the other Cullompton policies and is a necessary piece of local infrastructure which is required to mitigate traffic and air quality impacts associated with existing and future developments in the town.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will only take place once sufficient Community Infrastructure Levy monies have been collected and therefore is not likely to happen in the short term. Once built out, development will be permanent.
Spatial extent: (District wide / local)	The Eastern Relief Road will improve travel movements for Cullompton.

Summary of Recommendations

1. No recommendations following SA.

Policy CU15 Cullompton Infrastructure
Preferred Option

The policy safeguards the Cullompton Railway Station and Car Park and seeks Community Infrastructure Levy (CIL) and planning obligations to deliver; the provision of the Eastern Relief Road and other measures in the Cullompton Air Quality Action Plan, improvements to increased capacity at M5 Junction 28 and town centre regeneration and enhancement.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The Eastern Relief Road route will link Station Road to Meadow Lane via the Cullompton Community Association Fields. The route of the relief road could lead to the severance of wildlife corridors and wildlife networks, a negative effect. The proposed location of the train station is not anticipated to have a wildlife impact, however at this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	The town centre regeneration and enhancement measures are anticipated to have a positive effect on the Cullompton Conservation Area. The policy will also seek funds to support the enhancement and regeneration of the town centre.	+2
C) Mitigating the effects of climate change	The proposed route of the Cullompton Eastern Relief Road crosses flood zone 3, a negative effect. Road infrastructure is classed as essential infrastructure and must pass the sequential test and exception test if in flood zone 3a or 3b. The sequential and exception tests are passed as Devon County Council confirm this is the only option that can deal with Air Quality within the town, an overall neutral effect. The reopening of a train station at this location, could enable local residents to commute to work by train, rather than by car – particularly to Exeter, where a large number of the town's residents work. This would have a significant impact on reducing carbon emissions and take a number of cars off the road network.	+2
D) Safeguarding and minimising resource use	The site identified for the railway station is currently comprised of brownfield land, whilst the area of search for the Eastern Relief Road is grade 4 agricultural land (low quality land). Overall, a slight positive impact has been assumed.	+1
E) Promoting economic growth and employment	The Eastern Relief Road is expected to provide traffic relief to the town centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business, a positive effect. Junction 28 of the M5 motorway to the east of Cullompton has been identified as being at close to capacity during peak hours and therefore has limited capacity to accommodate additional development. The delivery of Junction improvements will unlock housing and employment capacity within Cullompton, a positive effect.	+2
F) Supporting retail	The Eastern Relief Road is expected to provide traffic relief to the town centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business, a positive effect. The policy will also ensure funds are collected	+2

	to go towards town centre regeneration and enhancement.	
G) Meeting housing needs	Junction 28 of the M5 motorway to the east of Cullompton has been identified as being at close to capacity during peak hours and therefore has limited capacity to accommodate additional development. The delivery of Junction improvements will unlock housing capacity within Cullompton, a positive effect.	+2
H) Ensuring community health and wellbeing	The Eastern Relief Road route will link Station Road to Meadow Lane via the Cullompton Community Association Fields. The construction of the road is likely to have an impact on the on the area of open space and recreation value, a negative effect. The Eastern Relief Road is an integral part of the existing development strategy for Cullompton, designed to relieve traffic through the town centre in conjunction with a road through the North West Urban Extension to link Tiverton Road to Willand Road, a significant positive effect on air quality within the town centre. Overall, there is a balancing act between these effects, a neutral effect has been assumed.	0
I) Delivering the necessary infrastructure	The Council plans to use the Community Infrastructure Levy to secure funding for offsite infrastructure delivery in the majority of cases, but there will be circumstances where it is still appropriate to use a planning obligation. The Council's strategic infrastructure policy is set out earlier in this document under Policy S9, but there are infrastructure requirements specific to Cullompton that are listed under Policy CU15. The Council will use the Community Infrastructure Levy and other sources of funding to deliver the infrastructure listed, and where planning obligations are sought, this policy will be the basis for negotiation. • The Local Transport Plan includes a long-term aspiration to reopen Cullompton Railway Station. A broad location south of Station Road is now identified as a possible site for the new station. The Local Plan protects land for a car park associated with any reopening of the station, a positive effect. • The Cullompton Air Quality Action Plan identifies a number of additional measures that will contribute towards improved Air Quality in the town centre. The Eastern Relief Road is an integral part of the existing development strategy for Cullompton, designed to relieve traffic through the town centre, significant a positive effect. • Junction 28 of the M5 motorway to the east of Cullompton has been identified as being at close to capacity during peak hours and therefore has limited capacity to accommodate additional development. In consultation with Devon County Council, the Highways Agency has agreed a scheme for the improvement of the junction to increase its capacity, a significant positive effect. • The Cullompton Air Quality Action Plan (AQAP) and the Cullompton Conservation Area Management Plan (CAMP) identify a number of potential opportunities for the enhancement of the town centre, through their delivery a positive effect to the town centre is anticipated. • The improvement to walking and cycling links are identified as action plan measures in the Cullompton Air Quality Action Plan. The provision of shared use surface between Honiton Road and Old Hill Road at Last Bridge has the potential to enhance access to employment opportunities. This improvement also aims to help to reduce car trips between the town and the major industrial area to the east of the M5 motorway, a positive effect. In combination this policy is considered to contribute towards an overall significant positive effect towards Cullomptons infrastructure requirements.	+3

Secondary/cumulative/synergistic effects:	This policy supports many of the other Cullompton policies and collects funds towards necessary pieces of local infrastructure. This infrastructure is required to mitigate traffic

	and air quality impacts associated with existing and future developments in the town, and provide opportunities to reduce carbon emissions by providing access to sustainable modes of transport.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The policy will have impacts over the lifetime of the plan, as monies will be gathered during all periods with development only likely to take place in the longer term.
Spatial extent: (District wide / local)	The impacts of the policy are likely to be wider than just Cullompton – as they are likely to provide means to improve transportation infrastructure which will facilitate commuting within the district and across the district's boundary.

Summary of Recommendations

1. No recommendations following SA.

Crediton Site Options

Policy CRE1 Wellparks
Preferred Option

A site of 22.9 hectares at Wellparks, A377, is allocated for residential development, including 185 dwellings, with 35% affordable housing, 15 hectares of green infrastructure, landscaping which reflects the sloping and visible nature of the site and which protects the setting of Downes Historic Park and Garden, and the provision of a sustainable urban drainage scheme.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area which is typified by being open, low lying and agriculturally prosperous. The site sits on a slope, rising to the north away from the A377. Development of the site would result in the loss of the agricultural fields which are visible on the right when approaching Crediton from the Exeter direction. The more northerly parts of the site are most elevated, and therefore are most sensitive to development. To reflect this, the northern area of the site is designated as green infrastructure within the policy, and is not proposed for development. In terms of wider landscape impacts, the adjoining development to the south will provide a degree of mitigation. The Council will review existing species or habitats information held on previously allocated sites and will commission where necessary further site-specific evidence as required. The results will be used to update this sustainability appraisal accordingly. A small but negative impact on the natural environment is anticipated as a result of developing this site.	-1
B) Protection and promotion of a quality built and historic environment	The site sits between the Crediton Conservation Area (to the west) and the local historic park and garden of the Downes Estate (to the east). A number of listed buildings also adjoin the south east corner of the site. The policy contains provisions that development should respect the setting of Downes, with the design of the development required to be locally distinctive. Whilst the conservation area lies to the west, the site is largely screened from views from within the conservation area by the steep topography immediately to the west of the site. The impact on the built and historic environment is considered to be neutral.	0
C) Mitigating the effects of climate change	The entirety of the site falls within flood zone 1, being the area of least flood risk. The sloping nature of the site means that surface water run-off could be problematic once the site is developed. This has been addressed through the requirement for the scheme to provide a sustainable urban drainage scheme to deal with all surface water. Overall, the inclusion of a Sustainable Urban Drainage (SUD) scheme is thought to mitigate any negative impacts on local flood risk.	0
D) Safeguarding and minimising resource use	This is a greenfield site which is currently within an agricultural use. The whole site is grade 3 agricultural land, which would be lost if the site was developed. Though not the highest quality agricultural land, development of the site would have a negative impact on this indicator.	-2
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	The policy contains no retail proposals, however the supermarket and high street are both in relative close proximity to the site, and would benefit from the custom of the residents from this development. There would be a small positive effect.	+1

G) Meeting housing needs	Crediton is a town with challenging topography, with few sites likely to be able to contribute towards meeting the housing need. This site would be able to meet a large proportion of Crediton's estimated housing need over the plan period. The policy also includes provision for 35% affordable housing, thereby providing a significant proportion of new housing within the town for those unable to access housing via other means. Overall, the impact of the policy is very positive.	+3
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctor's surgeries, schools and a non-emergency hospital. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. Option will contribute towards light and noise pollution, a slight negative effect although this is likely to be considerably alleviated once the new link road is complete. This housing site will be accessed via the link road, with residents bound for Tiverton or Exeter not needing to drive through the town centre. Development of the site is therefore unlikely to have a negative impact on existing air quality within the town centre. The delivery of green infrastructure as part of the site will be accessible by residents, and could include a mixture of play equipment, footpaths amongst other features and could therefore be considered to have a slight positive impact on the health of residents.	+1
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. It will direct traffic away from the town centre and the canyon-like Exeter Road. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of this site may put the primary schools under short-term pressure, but the development could support their longer-term expansion. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Crediton including affordable housing. Development of the relief road contributes towards reducing traffic in the town with a consequential positive impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 4 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Renewable and low carbon energy will be expected to provide a proportion of the sites energy use. Measures should include Travel Plan and infrastructure for low emission vehicles.
2. Measures to mitigate construction impact and the treatment of waste.

Policy CRE2 Red Hill Cross
Preferred Option

A site of 3.1 hectares at Red Hill Cross is allocated for residential development, including provision of 135 dwellings (of which 35% are to be affordable), landscaping to reflect the sloping nature of the site, a footpath link to Old Tiverton Road, extension to the cemetery and provision of a sustainable urban drainage scheme.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site sits on the border of two landscape character areas, the 'Lowland plains', and 'Sparsely settled valley floors'. This reflects the site's position above but in relatively close proximity to the flood zone around the River Creedy. It is on rising land, and is visible when approaching Crediton along the A3072. There will be a visual impact when heading into the settlement, as only a limited amount of housing is visible, when heading in this direction at present. Therefore a slight negative impact has been scored. . The Council will review existing species or habitats information held on previously allocated sites and will commission where necessary further site-specific evidence as required. The results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	There are no heritage designations in close proximity to this site. The policy seeks a layout, design and landscaping that reflect the local distinctiveness, the visibility of the site and its sloping nature. A neutral impact is therefore anticipated.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1, but is in very close proximity to the floodplain. Its elevated nature means that it is unlikely to be at risk of flooding, but surface water run-off from the site could exacerbate periodic flooding of the nearby River Creedy. The inclusion of a sustainable urban drainage scheme within the policy has been included to address this concern as such a scheme would ensure the retention of rain-water on-site. There are no specific criteria within the policy regarding the inclusion of renewable energy developments. Overall, the inclusion of a Sustainable Urban Drainage (SUD) scheme is considered to mitigate any negative impacts on flood risk, and therefore a neutral impact has been anticipated..	0
D) Safeguarding and minimising resource use	The site is grade 2 land, being high quality agricultural land. Approximately only 11% of land within the district is within the grade 2 category. Therefore, the loss of this land has a negative impact on this indicator.	-2
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. The town centre is walkable, but is some distance from the site. Whilst there may be some small positive benefit to local retail, overall the site has been scored as neutral for this indicator.	0
G) Meeting housing needs	This site makes a significant contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. The site sits adjacent to existing bus routes ensuring	+3

	that residents who do not own a car can access services and facilities within the town.	
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. This is likely to be considerably alleviated once the new link road is complete. Residents living at the new development will not be required to drive through the town centre when accessing Exeter or Tiverton, thereby minimising any potential negative impact on local air quality. Overall, the impact is considered to be neutral.	0
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. It will direct traffic away from the town centre and the canyon-like Exeter Road. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of this site may put the primary schools under short-term pressure, but the development could support their longer-term expansion. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	At present the extent of the built environment is relatively well contained within the landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's housing need but would likely have landscape impacts given the surrounding steep local topography. The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre. .
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 4 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Renewable and low carbon energy will be expected to provide a proportion of the sites energy use. Measures should include Travel Plan and infrastructure for low emission vehicles.

2. Measures to mitigate construction impact and the treatment of waste.

Policy CRE3 Cromwells Meadow
Preferred Option

A site of 1.3 hectares at Cromwells Meadow is allocated for residential development including provision of 50 dwellings (of which 35% are to be affordable) and the provision of a sustainable urban drainage scheme. The development is not permitted to commence until the new link road is operational.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site sits on the border of two landscape character areas, the 'Lowland plains', and 'Sparsely settled valley floors'. This reflects the site's position above but in relatively close proximity to the flood zone around the River Creedy. It is on higher ground than the nearby floodplain, and is partially visible when approaching Crediton along the A3072. There will be some visual impact when heading into the settlement, but some housing is already visible from the existing Cromwells Meadow estate, which is on higher ground than the proposed site, and which thereby mitigates against any impact. The Council will review existing species or habitats information held on previously allocated sites and will commission where necessary further site-specific evidence as required. The results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	There are no heritage designations in close proximity to this site. A neutral impact is therefore anticipated.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1, but is in very close proximity to the floodplain, with a small proportion of the north east corner falling within zones 2 and 3. The majority of the site is on rising ground and is unlikely to be at risk of flooding, but surface water run-off from the site could exacerbate periodic flooding of the nearby River Creedy. The inclusion of a sustainable urban drainage scheme within the policy has been included to address this concern as such a scheme would ensure the retention of rain-water on-site. There are no specific criteria within the policy regarding the inclusion of renewable energy developments. Overall, a given the mitigating impact of the Sustainable Urban Drainage (SUD) scheme, a neutral impact is anticipated.	0
D) Safeguarding and minimising resource use	Almost all the site (97%) is grade 3 agricultural land, which is the most common grade found throughout the district (approximately 64% of all land within the district is classed as grade 3). The loss of this land, which is not the most productive, is not considered to have a large negative impact.	-1
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. The town centre is walkable, but is some distance from the site, but buses do pass by the adjoining main road. Whilst there may be some small positive benefit to local retail, overall the site has been scored as neutral for this indicator.	0
G) Meeting housing needs	This site makes a large contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary	+2

	planning document, and will be tailored to achieve the appropriate balance. The site sits adjacent to existing bus routes ensuring that residents who do not own a car can access services and facilities within the town.	
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. The town services are walkable, but some are a distance from the site. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. This is likely to be considerably alleviated once the new link road is complete. The policy requires that the development does not start until the link road is complete, thereby ensuring there is not a short term impact on air quality. Once complete, residents living at the new development will not be required to drive through the town centre when accessing Exeter or Tiverton, as other routes will be available, thereby minimising any potential negative impact on local air quality. Overall, the impact is considered to be neutral.	0
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. It will direct traffic away from the town centre and the canyon-like Exeter Road. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of this site may put the primary schools under short-term pressure, but the development could support their longer-term expansion. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	At present the extent of the built environment is relatively well contained within the landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's housing need but would likely have landscape impacts given the surrounding steep local topography. The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre. .
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 2 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Requirement for screening along the north east boundary (as part of the SUDs) to minimise visual impact when viewed from the A3072 along the approach to Crediton.

Policy CRE4 George Hill
Preferred Option

A site of 0.96 hectares at George Hill is allocated for residential development including the provision of 19 dwellings (of which 35% are to be affordable), retention of the existing dwelling of 'Trenavin', appropriate highway improvements and the provision of a sustainable drainage scheme.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site lies within the settlement, being located within the grounds of a large house, 'Trenavin'. Given the location within the settlement there are not anticipated to be any landscape impacts. There are a number of protected trees within the site, which will be affected by the development. The recent planning officer report for the planning application on the site notes that though these trees will be affected, they can all be incorporated into the new scheme. Overall, therefore, the impact is considered to be negative. The Council will review existing species or habitats information held on previously allocated sites and will commission where necessary further site-specific evidence as required. The results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	There are no heritage designations in close proximity to this site. The original house, 'Trenavin', is not listed, but was considered to be of heritage value within the planning officer's report, and could be added to the Council's Heritage Assets Register as a locally listed heritage asset. The policy has been updated from that included within the Allocations and Infrastructure Development Plan Document to ensure the original dwelling to be retained. This is considered to be a slight positive impact.	+1
C) Mitigating the effects of climate change	The site is located in flood zone 1, and is not in close proximity to the floodplain. It is located on a slope, with the potential that surface water run-off could increase as a result of developing the site and increase flood risk within other areas of the town. However, the Environment Agency noted within their representation to the recent planning application that the reduced number of dwellings (19 were proposed within the application, as opposed to the policy requirement of 25) would enable the accommodation of suitable soakaways as part of the sustainable urban drainage scheme. The policy therefore now only requires delivery of 19, rather than 25 as proposed under the previous policy, in light of this advice. There are no specific criteria within the policy regarding the inclusion of renewable energy developments, however all new housing would be required to adhere to the sustainable design policy elsewhere in the document. Overall, a given the mitigating role of the Sustainable Urban Drainage (SUD) scheme, a neutral impact is anticipated.	0
D) Safeguarding and minimising resource use	The site is comprised of garden land associated with residential property. Development of the site will not result in the loss of quality agricultural land. Overall, there is a neutral impact.	0
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Housing development can boost local construction firms and associated trades who would benefit from being able to undertake contract work on the site. However, this is a relatively small scale, and therefore only a neutral impact on this indicator has been scored.	0
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. The town centre is walkable, but is some distance from the site. Whilst there may	0

	be some small positive benefit to local retail, overall the site has been scored as neutral for this indicator.	
G) Meeting housing needs	This site makes a contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+1
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. The Upper School is in close proximity to the site, which should enable children to walk to school. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. This is likely to be considerably alleviated once the new link road is complete. This is only a small development, with the Highway Authority not anticipating a significant impact on the road network.	0
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of this site may put the primary schools under short-term pressure, but the development could support their longer-term expansion. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre. .
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Retention of the protected trees.

Policy CRE5 The Woods Group, Exeter Road
Preferred Option

A site of 0.17 hectares is allocated for eight residential dwellings, including 35% affordable housing, with mitigation for air quality issues. The proposal includes provision of a sustainable urban drainage system.

Sustainability objective	**Commentary**	**Impact**

A) Protection of the natural environment	The site lies within the settlement, within an already developed central location. There will be no landscape impacts. Given its highly urbanised nature, it is not anticipated that developing the site will have any negative impact on the natural environment.	0
B) Protection and promotion of a quality built and historic environment	There is a listed building to the north of the site, and the whole site is within the conservation area. The site at present is run-down, and detracts from the quality of some of the nearby older buildings. Generally, redevelopment of the site has the potential to enhance the local street scene and positively impact on the quality of the conservation area.	+1
C) Mitigating the effects of climate change	The site is located in flood zone 1, and is not in close proximity to the floodplain. The policy requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off. The mitigating effect as a result of the inclusion of a Sustainable Urban Drainage (SUD) scheme has led to a neutral scoring.	0
D) Safeguarding and minimising resource use	This is a previously developed site, consisting of a number of low quality buildings. Redevelopment of this site is considered a positive outcome (even though the number of potential dwellings is low), reducing the reliance on the release of green field sites elsewhere.	+2
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Housing development can boost local construction firms and associated trades who would benefit from being able to undertake contract work on the site. However, this is a small scale proposal, and therefore only a neutral impact on this indicator has been scored.	0
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. The town centre is in close proximity, as is the supermarket at the southern end of the town. However, this is a small site, and whilst there may be some positive benefits, overall the site has been scored as neutral for this indicator.	0
G) Meeting housing needs	This site makes a contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. It is only a small scale proposal, therefore only a minor positive score has been proposed.	+1
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctor's surgeries, schools and a non-emergency hospital. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. The site is located on Exeter Road, which is one of the areas of highest air quality concern. This is likely to be considerably alleviated once the new link road is complete. However, the policy does stipulate that there should be on-site air quality mitigation to ensure quality of life for new residents. Therefore, it is anticipated that there will be no negative impact associated with developing the site.	0
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of a site of this size is unlikely to have a large impact on school places. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre. .
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. No recommendations following SA.

Policy CRE6 Pedlerspool

Option

A site of 23.5 hectares at Pedlerspool could be allocated for a mixed use comprising 165 dwellings (including 35% affordable housing and at least five gypsy and traveller pitches), 21,000 square metres of employment floorspace, relocation of Crediton Rugby Club, landscaping and green infrastructure to reflect its sloping nature and to protect the setting of the wider area. The policy also stipulates the inclusion of a sustainable urban drainage scheme, employment delivery rates and that the scheme should not come forward until the link road is complete.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site sits astride the boundary of two landscape character areas. The south western part falls within the 'lowland plains' area which is typified as being open, low lying, flat and agriculturally prosperous. The north east falls within the 'sparsely settled farmed valley floors' an area typified by the presence of rivers or streams and related flat or gently sloping valley bottoms. Development of the whole site would have a large impact on the landscape character of the area. Views to the site from the north and east are far reaching. The site would also extend the built area of Crediton further to the north and east. At present the north-eastern boundary of the site is relatively well contained, shielding the built environment from being visible to the north and east. A significant amount of landscaping and green infrastructure is proposed as part of the policy, in order to protect the upper slopes and shield parts of the site from inward views. The part of the site closest to the river is also designated as a priority habitat, being 'coastal and floodplain grazing marsh'. A number of protected trees are sited within the centre of the site. To mitigate the impacts on the landscape the policy includes provision for a significant amount of landscaping, with protection afforded for the most elevated and visible slopes to the south west of the site. Nevertheless, it is acknowledged that there will be impacts as a result of developing this site.	-2
B) Protection and promotion of a	The site sits to the east of Creedy Country Park, a locally important historic park and garden. The park shares a boundary running north-east to south-west with this site. The further to the north east, where the site is flatter, the park is already well screened	-1

quality built and historic environment	from views from the east due to the presence of walls and continual tree cover along the boundary. To the south west of the boundary, the landscape is more open, and much more elevated. The potential impact along this section is therefore greater. The policy contains provisions that the setting of the upper slopes should be used for landscaping and green infrastructure accordingly. It is possible, however, that there may still be an impact on the adjoining park. The policy seeks layout, design and landscaping, including planting on the riverside that reflects the local distinctiveness and its sloping nature.	
C) Mitigating the effects of climate change	The 23.5 hectares of the site are all located in flood zone 1, however to the east is the floodplain of the River Creedy. The policy requires the inclusion of a sustainable urban drainage scheme to ensure retention of all surface water from the site, to avoid increasing the risk of flooding. The inclusion of a Sustainable Urban Drainage (SUD) scheme is considered to mitigate against an increase in flood risk, therefore an overall neutral impact has been scored.	0
D) Safeguarding and minimising resource use	This is a large greenfield site, which is currently made up of a mixture of grade 2 and 3 agricultural land, of which 10.1ha is grade 2. Much of the farmland within the district is grade 3, however only approximately 11% of land falls with grade 2. The loss of the 10.1 hectares of productive land is a negative outcome of developing the site.	-2
E) Promoting economic growth and employment	The policy contains provisions for 21,000 square metres of commercial floorspace. Crediton has had very little employment development in recent years, and the provision of this quantity would ensure sufficient land for many years to come. Due to the topography of the town, there are few other sites which are suitable for employment. Many parts of the site are flat, and therefore are more appropriate to the needs of various types of employment. A site of this scale could provide a significant number of jobs for the town, potentially reducing out-commuting and increasing self-containment. No other site in the town offers the same level of employment potential.	+3
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. Residents may make use of the town centre and supermarkets, thereby providing an added boost to local shopping. A small positive impact is anticipated as a result.	+1
G) Meeting housing needs	This site would make a significant contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing and would also meet the needs of gypsies and travellers by providing at least five pitches. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. It is a large scale proposal, and scores highly as a result.	+3
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. This is likely to be considerably alleviated once the new link road is complete. Though traffic generated by the site would not need to enter the town centre if travelling to Tiverton or Exeter, to ensure there are not adverse impacts on the town centre air quality, the site is only proposed to come forward once the link road has been completed. The policy also contains provision for the relocation of the rugby club, and open space and other sports provision as part of the green infrastructure. This is considered to be a positive outcome.	+2
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. The delivery of this site may put the primary schools under short-term pressure, but the development could support their longer-term expansion. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	At present the extent of the built environment is relatively well contained within the

	landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's housing need but would likely have landscape impacts given the surrounding steep local topography. The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 4 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Retention of protected trees
2. Include provision of small retail unit to serve development
3. Green infrastructure on land within the flood plain.

Policy CRE7 Sports field, Exhibition Road

Option

A site of 2.8 hectares at the sports field on Exhibition Road could be allocated for 50 dwellings (including 35% affordable housing). The proposal would include relocation of the rugby club, archaeological investigation, implementation of a Transport Plan and provision of a sustainable urban drainage scheme.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	This is a site that lies within the settlement, and therefore any impact on landscape character would be minimal. There are no known priority habitats or records of protected species nearby. The impact on the natural environment is likely to be neutral.	0
B) Protection and promotion of a quality built and historic environment	There are no known heritage assets in close proximity, however the site does lie within an area of archaeological potential. Archaeological investigation could reveal more about the history of this site, though the subsequent development of the site would result in the permanent loss of any undiscovered archaeological remains. The policy therefore requires archaeological mitigation prior to development of the site, in order to better understand the significance of the site's heritage. Overall, the application of this mitigation has resulted in a reduced but slightly negative impact on the historic environment.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1, and is not in close proximity to the floodplain. The policy requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off. Overall the inclusion of the Sustainable Urban Drainage (SUD) scheme should mitigate against any wider flood risk impact, and therefore a neutral impact has been scored.	0

D) Safeguarding and minimising resource use	Though this site is used for recreational purposes, notionally it is a green field site, with potential to be used for agricultural purposes. Approximately 36% of the site falls within the grade 2 category, therefore being quality agricultural land. The remainder of the site is not categorised. Though notionally grade 2 in part, such a site, separated from other farmland, is unlikely to return to farming use unless there are significant demand changes within the industry. A minor negative outcome is therefore anticipated.	-1
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Housing development can boost local construction firms and associated trades who would benefit from being able to undertake contract work on the site. However, a site of this size would have some positive impact on local building trades, and therefore a minor positive impact on this indicator has been scored.	+1
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. The town centre is in close proximity. However, this is a medium sized site, and whilst there may be some positive benefits to retail, overall the site has been scored as neutral for this indicator.	0
G) Meeting housing needs	This site makes a contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+2
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctor's surgeries, schools and a non-emergency hospital. The town services are walkable, but some are a distance from the site. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. This is likely to be considerably alleviated once the new link road is complete. However, the policy does stipulate the requirement for the implementation of a Transport Plan to minimise air quality impacts. Development of this site will only be able to take place once the rugby club (who currently make use of the site) have been relocated. This is stipulated within the policy, to ensure that there is no net loss to sports provision within the town. Therefore, it is anticipated that there will be no negative impact associated with developing the site.	0
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of a site of this size may have some impact on school places in the short term, but should be able to fund their longer-term expansion. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre. .
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 4 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. No recommendations following SA.

Policy CRE8 Land at Barn Park

Option

A site of 1.64 hectares at Hunniver's Lane could be allocated for 20 dwellings, including 35% affordable housing, with vehicular access being off Barn Park. The policy also includes provision of a sustainable urban drainage system.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This sites lies adjacent to the south west side of the settlement. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. It falls within the 'lowland plains' landscape character area which is typified as being open, low lying, flat and agriculturally prosperous. The site abuts the existing built development off Barn Park, but the land slopes away to the south west offering wide views. However, this is a small development which would be mitigated by the adjacent housing, and landscape impacts therefore are considered to be minimal.	0
B) Protection and promotion of a quality built and historic environment	There are no known heritage designations in close proximity. Overall, impact against this indicator is neutral.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1, and is not in close proximity to the floodplain. The policy requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off. This should mitigate against any increased flood risk. The site also lies within very close proximity to the lower school, which may permit some children to walk to school, thereby lowering vehicular trip rates. Therefore, a slight positive impact has been assumed.	+1
D) Safeguarding and minimising resource use	The site is located on existing farmland, which currently does not have an agricultural land grade classification. Development of the site would result in the permanent loss of the farmland and though this is a relatively small site, this would still be a minor negative impact.	-1
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Housing development can boost local construction firms and associated trades who would benefit from being able to undertake contract work on the site. However, this is a small scale proposal, and therefore only a neutral impact on this indicator has been scored.	0
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. However, this is a small site, and whilst there may be some positive benefits, overall	0

	the site has been scored as neutral for this indicator.	
G) Meeting housing needs	This site makes a contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. It is only a small scale proposal, therefore only a minor positive score has been proposed.	+1
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctor's surgeries, schools and a non-emergency hospital. The town services are walkable, but some are a distance from the site. The Lower School is in close proximity to the site, which should enable children to walk to school. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. This is likely to be considerably alleviated once the new link road is complete. The close proximity of the site will enable children to walk to the lower school, and access other services offered on site. Therefore, it is anticipated that there will be no negative impact associated with developing the site.	0
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of a site of this size is unlikely to have a large impact on school places. The local road infrastructure has limited capacity for additional development, therefore only a maximum of 20 dwellings have been specified for the site. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	At present the extent of the built environment is relatively well contained within the landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's housing need but would likely have landscape impacts given the surrounding steep local topography. The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. No recommendations following SA.

Policy CRE9 Stonewall Lane Playing Field

Option

A site of 3.2 hectares at Stonewall Lane Playing Field could be allocated for 60 dwellings (including 35% affordable housing). The policy requires the relocation of the playing fields to an alternative site, access requirements and highway alterations, archaeological investigation and the provision of a sustainable urban drainage system.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site lies within the settlement, but is located in an elevated position along the town's northern boundary. It falls within the 'lowland plains' landscape character area, which is normally typified by being an open, low lying, flat and agriculturally prosperous area. The elevated nature of the site means there are wide views to be obtained looking south from the playing field. There would also be some landscape impacts when looking north towards the site. It is shielded by the woods to the north from views from that direction. The site is surrounding on three sides by housing, which would mitigate against any impacts, though some may still arise.	-1
B) Protection and promotion of a quality built and historic environment	The site is located adjacent to Creedy Park listed on the local register of Historic Parks and Gardens. The site lies in an area of archaeological potential and in prominent position in the landscape where prehistoric activity is known from an enclosure site to the west. Any planning application for development here would need to be supported by a programme of archaeological work to allow an underst6anding of the significance of heritage assets that may be present here.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1, and is not in close proximity to the floodplain. The policy requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off. This is considered to mitigate against any flood risk that may arise.	0
D) Safeguarding and minimising resource use	Though this site is used for recreational purposes, notionally it is a green field site, with potential to be used for agricultural purposes (though no agricultural grade exists for the site). Such a site, separated from other farmland, is unlikely to return to farming use unless there are significant demand changes within the industry. Given the loss of the land, a minor negative outcome is indicated.	-1
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Housing development can boost local construction firms and associated trades who would benefit from being able to undertake contract work on the site. A proposal of this scale would have some positive impact.	+1
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. Whilst there may be some positive benefits for retail, overall the site has been scored as neutral for this indicator.	0
G) Meeting housing needs	This site makes a contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. It is a medium scale proposal, therefore a positive score has been proposed.	+2

H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. The town services are walkable, but some are a distance from the site. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. This is likely to be considerably alleviated once the new link road is complete. Development of the site would result in the loss of the playing fields. Therefore, the policy stipulates that the site could only come forward, once suitable alternative provision has been found. Therefore, it is anticipated that there will be no overall negative impact associated with developing the site.	0
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. There are existing houses located to the south and west of the site. The only possible access points would be along the northern boundary which contains hedgerows and is bounded by a narrow single width track. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of a site of this size is unlikely to have a large impact on school places. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	At present the extent of the built environment is relatively well contained within the landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's housing need but would likely have landscape impacts given the surrounding steep local topography. The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 2 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. No recommendations following SA.

Policy CRE10 Land at Westwood Farm

Option

A site of 3.5 hectares at Westwood Farm could be allocated for 50 dwellings (including 35% affordable housing). Access would either be from Westernlea, or direct from the A377, and the site would need to be subject to archaeological mitigation and the inclusion of a sustainable urban drainage scheme.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site lies on the western edge of the town and falls within the 'lowland plains' landscape character area. These areas are typified by being low lying, generally flat and agriculturally prosperous. This site is quite steeply sloping, and there is the possibility of wider landscape impacts by expanding the town further to the west. This could be particularly felt given the elevated nature of the site in comparison with the adjoining housing to the east. The site is at a lower level than then A377 which runs along the northern boundary, with limited views in when approaching along the main road. Nevertheless, given the sloping nature of the site, there will be some impact on the surrounding landscape.	-1
B) Protection and promotion of a quality built and historic environment	There are no known heritage assets in close proximity, however the site does lie within an area of archaeological potential. Archaeological investigation could reveal more about the history of this site, though the subsequent development of the site would result in the permanent loss of any undiscovered archaeological remains. The policy therefore requires archaeological mitigation prior to development of the site, in order to better understand the significance of the site's heritage. Overall, the application of this mitigation has resulted in a reduced but slightly negative impact on the historic environment.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1, and is not in close proximity to the floodplain. The policy requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off. This is considered to mitigate against any flood risk that may arise.	0
D) Safeguarding and minimising resource use	This is an agricultural site, all of which is categorised as grade 3 land. The majority of agricultural land within the district falls within this category. Therefore, a slight negative impact has been assumed given the potential loss of this land.	-1
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Housing development can boost local construction firms and associated trades who would benefit from being able to undertake contract work on the site. A proposal of this scale would have some positive impact.	+1
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. The town centre is in relatively close proximity, however, whilst there may be some positive benefits, overall the site has been scored as neutral for this indicator.	0
G) Meeting housing needs	This site makes a contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. It is a medium scale proposal, therefore a positive score has been proposed.	+2
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. The Upper School is in relative close proximity to the site, which should enable children to walk to school. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. The site is located on the west side of the town, and any traffic generated by the site travelling to Tiverton , Exeter or the M5 would pass through the High Street, thereby potentially further exacerbating existing air quality issues. Though upon completion of the link road it is anticipated that air quality within the town centre will improve, overall the outcome of developing in this location could slightly negatively impact on air quality levels.	-1

I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of a site of this size is unlikely to have a large impact on school places. The total number of dwellings for the site has been limited to take account of the capacity of the existing road infrastructure. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre. At present the extent of the built environment is relatively well contained within the landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's housing need but would likely have landscape impacts given the surrounding steep local topography.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 2 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Appropriate landscaping to mitigate against visual impacts associated with developing the site and protection of the upper slopes to reduce visual impact.
2. Site only to come forward once the Crediton Link Road is in place

Policy CRE11 Land at Chapel Down Farm

Option

A site of 10 hectares could be allocated for 120 dwellings (of which 35% would be affordable). The policy contains a requirement for substantial improvements to the local road network, archaeological investigation and provision of a sustainable urban drainage scheme.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. This is a prominent site lying on the western boundary of the town. It is steeply sloping, with the northern element being considerably	-2

	higher than the southern part of the site. The site falls within the 'lowland plains' landscape character area, being characterised by being part of a generally low lying, agricultural landscape. When viewing the town from further to the west, views of the existing built environment are limited by the topography, with the most westerly development, Queen Elizabeth Drive, being partly screened from view by its location within a fold in the landscape. This site is more prominent, and would visibly extend the built environment, with the potential for it to be seen from distant viewpoints. A lower density of housing has been assumed, which could ensure that the development is focused away from the most prominent elements. Generally though, there would be a large landscape impact as a result of developing this site.	
B) Protection and promotion of a quality built and historic environment	Chapel Downs Farmhouse is a listed building which sits adjacent to the site. The farm complex would once have been more separate from the town, but over the years residential growth has brought the site within Crediton's urban fringe. Development of the surrounding agricultural land will further impact on the setting of the building, with the potential to reduce its significance. The site also contains a probable prehistoric enclosure, which requires further archaeological investigation. The policy therefore requires appropriate archaeological investigation prior to any development taking place. Overall, however, development of the site has the potential to negatively impact on the historic environment.	-2
C) Mitigating the effects of climate change	The site is located in flood zone 1, though flood zones 2 and 3 (presumably a stream) lies to the south of the site (immediately to the south of the A377). The steep topography combined with development of the site could lead to potential off-site impacts due to surface water run-off. The policy therefore includes a sustainable urban drainage scheme to retain all on-site water. This is considered to mitigate against any potential impact and therefore a neutral score has been assumed.	0
D) Safeguarding and minimising resource use	This is a greenfield site on the edge of the settlement. The northern portion of the site is agricultural grade 2, whilst the southern (and larger) portion is grade 3. Only 11% of land within the district is grade 2. The loss of several hectares of this valuable land is a sustainability concern for the long-term retention of quality agricultural land within the district. A negative outcome has therefore been scored.	-2
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Housing development can boost local construction firms and associated trades who would benefit from being able to undertake contract work on the site. However, this is a large proposal, and therefore a positive knock-on effect on local construction could be anticipated.	+1
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. The town centre is in relatively close proximity, and would be walkable. Given the number of dwellings on site it could be assumed that there would be an associated retail boost for the high street and local supermarkets.	+1
G) Meeting housing needs	This site would make a large contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. It is a large scale proposal, therefore a high positive score has been proposed.	+3
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. The town services are walkable, but some are a distance from the site. The Upper School is in relatively close proximity to the site, which should enable children to walk to school. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. The site is located on the west side of the town, and any traffic generated by the site travelling to Tiverton , Exeter or the M5 would pass through the High Street, thereby potentially further exacerbating existing air quality issues. Though upon	0

	completion of the link road it is anticipated that air quality within the town centre will improve, overall the outcome of developing in this location could negatively impact on air quality levels. There are some positive and negative impacts, however on balance a neutral impact has been assumed.	
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. The policy includes provisions for substantial upgrades to Higher Road. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. The delivery of this site may put the primary schools under short-term pressure, but the development could support their longer-term expansion. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre. At present the extent of the built environment is relatively well contained within the landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's housing need but would likely have landscape impacts given the surrounding steep local topography.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 3 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Protection of the setting of the listed Chapel Downs Farmhouse
2. Sensitive location of dwellings to reduce overlooking of the existing adjacent properties on Queen Elizabeth Drive
3. Site only to come forward once the Crediton Link Road is in place

Policy CRE12 Barnfield

Option

A site of 0.25 hectares could be allocated for six residential dwellings, including 35% affordable housing. The policy stipulates that access would need to come via Town Park, and that development would need to include a sustainable urban drainage scheme.

Sustainability	Commentary	Impact

objective		
A) Protection of the natural environment	The site lies within the settlement and currently comprises a strip of land which is under-used, being located at the rear of properties on Barnfield, within an area which already has nearby existing residential development. Though the site is visible given its elevated location, the adjoining housing to the west and south (which is higher up the hillside) would mitigate against any landscape impacts. Given the site is generally unused and overgrown land, there is the potential for the presence of a variety of species, including potentially protected species. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. A neutral impact is currently being assumed.	0
B) Protection and promotion of a quality built and historic environment	The site sits to the south of the Crediton Conservation Area, with a number of listed buildings along the high street. There is existing development adjacent to the site. The development of a small number of dwellings in this location is unlikely to affect the setting of these buildings, given the widespread development that has already taken place on the south side of the high street, and up the slopes of the hillside. The site is located in an area of archaeological potential, with the rear of the plots along the high street, being within the historic core of the town. Therefore, the impact is considered to be slightly negative, as developing the site could result in the loss of the archaeological features.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1, and is not in close proximity to the floodplain. The policy requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off. This is considered to mitigate against any flood risk that may arise.	0
D) Safeguarding and minimising resource use	Whilst not a previously developed site, this is an area with no agricultural land classification. It is an under-utilised area of land adjacent to Town Park and on the southern side of the High Street. Use of such sites for housing will reduce the need to allocate greenfield sites elsewhere. Therefore, a small positive impact has been assumed.	+1
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Housing development can boost local construction firms and associated trades who would benefit from being able to undertake contract work on the site. However, this is a small scale proposal, and therefore only a neutral impact on this indicator has been scored.	0
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base, especially given the close proximity of the site. However, this is a small site, and whilst there may be some positive benefits, overall the site has been scored as neutral for this indicator.	0
G) Meeting housing needs	This site makes a contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. It is only a small scale proposal, therefore only a minor positive score has been proposed.	+1
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. Both schools are in close proximity to the site, which should enable children to walk to school. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. This is likely to be considerably alleviated once the new link road is complete. Traffic generated by the site would need to drive through the town centre if travelling on to Exeter, Tiverton or further afield. However, many services and facilities are within walking distance of the site, which is considered a positive impact.	+1
I) Delivering the necessary	The provision of the Crediton Link Road represents a significant upgrade to the local road network. The site should be accessed from Town Park. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money	0

infrastructure	generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of a site of this size is unlikely to have a large impact on school places. The overall impact is therefore considered to be neutral.	

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Include requirement for archaeological investigation to take place prior to development of the site.

Policy CRE13 Land at Alexandra Close

Option

A site of 0.63 hectares could be allocated for fifteen residential dwellings, including 35% affordable housing. The proposal includes provision of a sustainable urban drainage system.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site lies within the settlement, and is surrounded by existing residential development (largely built in the 1960s/70s). It is not considered that there will be any landscape impacts as a result of developing the site. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. A neutral impact is currently being assumed.	0
B) Protection and promotion of a quality built and historic environment	There are no heritage assets within the vicinity, nor is there evidence of any archaeological impacts from developing the site. Overall the outcome is therefore considered to be neutral.	0
C) Mitigating the effects of climate	The site is located in flood zone 1, and is not in close proximity to the floodplain. The policy requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off. This is considered to mitigate against any flood risk that may	0

change	arise.	
D) Safeguarding and minimising resource use	This is a greenfield site located within the settlement. It is currently used for grazing sheep. Approximately half of the site is agricultural grade 2, the other half is graded 'urban' (and effectively has no grade). Grade 2 land is limited in Mid Devon (only 11% of land is grade 2), however the loss of 0.3ha is not considered to be significant. Given it is a greenfield site (though small in size), a slight negative impact has been assumed.	-1
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Housing development can boost local construction firms and associated trades who would benefit from being able to undertake contract work on the site. However, this is a small scale proposal, and therefore only a neutral impact on this indicator has been scored.	0
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base (the town centre is in relatively close proximity). However, this is a small site, and whilst there may be some positive benefits for retail, overall the site has been scored as neutral for this indicator.	0
G) Meeting housing needs	This site makes a contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 35% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. It is only a small scale proposal, therefore only a minor positive score has been proposed.	+1
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. The town services are walkable, but some are a distance from the site. The Upper School is in close proximity to the site, which should enable children to walk to school. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. The site is located on the west of Crediton, and any traffic accessing the high street, or heading for Tiverton, Exeter or beyond will need to drive through the town centre, thereby potentially having a low but negative impact on air quality. However, given the small size of the development, this impact is likely to be very low. Overall, it is anticipated that there will be no negative impact associated with developing the site.	0
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. Crediton primary schools are at capacity but have room to expand. Community Infrastructure Levy money generated from the site can be used to fund these improvements, with such proposals needing to be included within the Infrastructure Delivery Plan, which will be finalised in mid-2014. Overall, the infrastructure is already in place, or nearing completion. The delivery of a site of this size is unlikely to have a large impact on school places. The overall impact is therefore considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. The estimated development time for this site is 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. No recommendations following SA.

Policy CRE14 Wellparks (employment)
Preferred Option

A site of 1.5 hectares is allocated for 4,150 square metres of employment floorspace, through the conversion of existing buildings (of which some are listed) and development of some new buildings. The policy includes provisions for the design which takes account of the buildings listed status, and the inclusion of a sustainable urban drainage scheme.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site lies on the south eastern edge of the settlement, on the southern edge of rising land. It would be highly visible when viewed from the south, and when approaching Crediton from the Exeter direction. The presence of existing buildings on the site, which are to be re-used, would mitigate some of the impact, as would the presence of recent development to the south of the site. Some impacts would be expected however. The existing and disused buildings could harbour protected species (bats and or owls are known to make use of abandoned buildings). However, at this stage, the Council is not aware of the presence of protected species or habitats (a phase 1 habitat survey undertaken when the site was allocated did not note the presence of protected species). Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. A negative impact is currently being assumed based on the potential impact on the wider landscape.	-2
B) Protection and promotion of a quality built and historic environment	A large part of the site is formed of the 'Wellparks' grade II farmhouse and farmstead complex. The setting of this site has traditionally been rural, given its separation from the town. However, urban encroachment has already began to bring the site within the semi-urban fringe, particularly with the recent supermarket development to the south. The development of the site would further impact on the historic value of the buildings. To the east of the site lies the historic estate of Downes. It is not anticipated that development of this site will impact on Downes given the topography which separates the sites. The policy seeks design and layout to respect the character and setting of the listed buildings.	-2
C) Mitigating the effects of climate change	The site is located in flood zone 1, but is in close proximity to the floodplain. The policy requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off, which could otherwise contribute to flooding on the River Yeo to the south. This is considered to be an improvement on the existing situation, given the developed nature of the site, and therefore is a positive outcome. This site, when considered alongside the housing site CRE1 'Wellparks' can be considered a mixed use proposal. Such schemes give residents the opportunity to live in close proximity to their place of work, thereby reducing the reliance on travel to further places of employment, reducing carbon emissions as a result.	+2
D) Safeguarding and minimising	This is a previously developed site, consisting of a number of existing farm buildings. Though some new buildings are proposed, the re-use of the existing buildings minimises the need for significant new building, and reduction of resources needed for their	+2

resource use	construction. Allocating sites on previously developed land also reduces the need for greenfield sites elsewhere.	
E) Promoting economic growth and employment	The policy contains provision for over 4000 square metres of employment floorspace. Crediton has had limited employment development within recent years, and this site could meet a large proportion of the town's employment needs and creating local jobs.	+2
F) Supporting retail	The policy contains no specific retail proposals, however, retail does fall within the overall definition of commercial development. It is possible, therefore, that retail proposals could come forward on these sites if allocated. However, the any such proposals would also need to be considered against sequential test set down in the 'Development outside town centres' policy. This should mitigate against any harmful impacts against existing retail.	0
G) Meeting housing needs	The policy contains no housing proposals. No impact is anticipated.	0
H) Ensuring community health and wellbeing	Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. The site is located off the A377, and adjacent to the proposed link road which is currently under construction. Employment traffic generated by the site will be able to make use of the link road (when heading towards Tiverton), or via the A377 direct to Exeter, only needing to drive through the town centre when heading west along the A377. There will likely be some negative off-site air quality impacts as a result however.	-2
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. Overall, the infrastructure is already in place, or nearing completion. Given that the site will be accessed via the new link road (and can only therefore come forward once the road is operational), the overall impact on infrastructure is considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The development will help meet the employment needs in Crediton. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs within Crediton. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. A site design brief should be included within any planning application focusing on how the rural setting of the complex can be maintained.

Policy CRE15 Additional Crediton commercial sites (A) Land south of Commonmarsh Lane

Option

A site of 2.74 hectares could be allocated for 5,740 square metres of commercial floorspace. The policy would require there to be suitable vehicular access, provision of a sustainable urban drainage scheme and retention of areas within the floodplain as green infrastructure.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site lies on the eastern edge of Crediton, and falls within the 'lowland plains' landscape character area which is typified by generally being low lying, flat and agriculturally prosperous. The site slopes upwards towards the south, and would extend the area covered by the existing industrial estate further up the hillside. There would be a landscape impact when viewing the site from the north, as the hillside, and particularly the upper slopes, are visible from afar. Biodiversity records state that there may be the presence of badgers on part of the site. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. Given the potential landscape and biodiversity impacts, a negative score has been assumed.	-2
B) Protection and promotion of a quality built and historic environment	Within or near to the site lies a possible pre-historic or Romano-British enclosure, with the potential for further deposits to be found in the area. The Downes estate, a locally important historic park and garden which includes a grade II* farmhouse lies adjacent to the site to the south. The intervening topography between the site and the estate should protect the setting of the park and garden, which lies behind the ridge line to the south of the site. A negative impact has been assumed given the potential disturbance of the archaeological remains in the area and the possibility of an impact on the Downes Estate.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 on elevated land. The floodplain of the River Creedy lies to the east. The increase in surface water run-off as a result of developing the site could have off-site impacts. The policy therefore requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off. This is considered to mitigate against any negative impact.	0
D) Safeguarding and minimising resource use	This is a greenfield site which falls within agricultural land grade 2. Approximately only 11% of land within the district is this grade (grade 2 is high quality agricultural land). Though not a particularly large site, the loss of land of this quality is a negative impact of developing this site.	-1
E) Promoting economic growth and employment	The policy contains provision for over 5,700 square metres of employment floorspace. Crediton has had limited employment development within recent years, and this site could meet a large proportion of the town's employment needs and creating local jobs.	+2
F) Supporting retail	The policy contains no specific retail proposals, however, retail does fall within the overall definition of commercial development. It is possible, therefore, that retail proposals could come forward on these sites if allocated. However, the any such proposals would also need to be considered against sequential test set down in the 'Development outside town centres' policy. This should mitigate against any harmful impacts against existing retail.	0
G) Meeting housing needs	The policy contains no housing proposals. No impact is anticipated.	0
H) Ensuring community health and wellbeing	Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. The site is located adjacent to the existing industrial estate and in close proximity to the proposed link road which is currently under construction. Employment traffic generated by the site will be able to make use of the link road (when heading towards Tiverton), or via the A377 direct to Exeter, only needing to drive through the town centre when heading west along the A377. There will likely be some negative off-site air quality impacts as a result however.	-2
I) Delivering the	The provision of the Crediton Link Road represents a significant upgrade to the local road network, with the site being able to make	0

necessary infrastructure	use of the link road once complete. Overall, the infrastructure is already in place, or nearing completion.	

Secondary/cumulative/synergistic effects:	At present the extent of the built environment is relatively well contained within the landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's employment need but would likely have landscape impacts given the surrounding steep local topography. The development will help meet the employment needs in Crediton. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs within Crediton. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Include requirement for archaeological investigation to take place prior to development of the site
2. Include requirement for any development to ensure the protection of the setting of Downes estate

Policy CRE15 Additional Crediton commercial sites (B) Land east of Exeter Road

Option

A site of 5.3 hectares could be allocated for 11,130 square metres of commercial floorspace. The policy would require there to be suitable vehicular access, provision of a sustainable urban drainage scheme and retention of areas within the floodplain as green infrastructure.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site lies on the eastern edge of Crediton, and falls within the 'lowland plains' landscape character area which is typified by generally being low lying, flat and agriculturally prosperous. The site is steeply sloping, particularly within the south west. It is highly visible from the south west, but is bounded by hedgerows to the east. Generally the site is elevated, and there would be landscape impacts as a result of seeing it developed. There are no natural environment designations within or in close proximity to the site. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. A negative impact is currently being assumed based on the potential impact on the wider landscape.	-2

B) Protection and promotion of a quality built and historic environment	There is no known archaeological significance attached to this site. The site does lie adjacent to the conservation area to the west, which contains a number of listed buildings, including the house and walled garden of Fair Park immediately adjacent. The elevated nature of the site means there is potential for development to impact on the historic setting of the adjacent buildings along Exeter Road.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 on elevated land. The floodplain of the River Creedy lies further to the east, whilst the River Yeo is some distance to the south. The increase in surface water run-off as a result of developing the site could have off-site impacts. The policy therefore requires the inclusion of a sustainable urban drainage scheme to reduce the impact of surface water run-off. This is considered to mitigate against any negative impact.	0
D) Safeguarding and minimising resource use	This is a greenfield site. Only part of the site has been classified with an agricultural grade. The southern element of the site, comprising 3.4 hectares is agricultural grade 3. This is the most common grade found throughout the district, accounting for approximately 64% of all land. Though of reasonable quality, its loss is only considered to be a minor negative impact.	-1
E) Promoting economic growth and employment	The policy contains provision for over 11,1430 square metres of employment floorspace. Crediton has had limited employment development within recent years, and this site could meet a large proportion of the town's employment needs and creating local jobs.	+3
F) Supporting retail	The policy contains no specific retail proposals, however, retail does fall within the overall definition of commercial development. It is possible, therefore, that retail proposals could come forward on these sites if allocated. However, the any such proposals would also need to be considered against sequential test set down in the 'Development outside town centres' policy. This should mitigate against any harmful impacts against existing retail.	0
G) Meeting housing needs	The policy contains no housing proposals. No impact is anticipated.	0
H) Ensuring community health and wellbeing	Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. The site is located adjacent to the existing industrial estate and in close proximity to the proposed link road which is currently under construction. Employment traffic generated by the site will be able to make use of the link road (when heading towards Tiverton), or via the A377 direct to Exeter, only needing to drive through the town centre when heading west along the A377. There will likely be some negative off-site air quality impacts as a result however.	-2
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network, with the site being able to make use of the link road once complete. Overall, the infrastructure is already in place, or nearing completion.	0

Secondary/cumulative/synergistic effects:	At present the extent of the built environment is relatively well contained within the landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's employment need but would likely have landscape impacts given the surrounding steep local topography. The development will help meet the employment needs in Crediton. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.

Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs within Crediton. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. Requirement for landscaping along the western boundary to protect setting of the conservation area and the listed Fair Park House

Policy CRE15 Additional Crediton commercial sites (C) South of Wellparks and A377

Option

A site of 2.77 hectares could be allocated for 5,820 square metres of commercial floorspace. The policy would require there to be suitable vehicular access, provision of a sustainable urban drainage scheme and retention of areas within the floodplain as green infrastructure.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site lies on the southern edge of the settlement, falling within the 'sparsely settled and farmed valley floors' landscape character area, being an area typified by the presence of streams or rivers. The site is largely flat, reflecting its proximity to the floodplain to the south. Development of the site would be visible on the approach into Crediton along the A377, and from the higher ground to the south. The flat nature of the site could allow it to be well-screened to mitigate some of the impact. In terms of biodiversity, some of the site (particularly the southern element) has the potential to be a priority habitat, being floodplain grazing marsh. At this stage no further information is known about the presence of protected species. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	This area has already been subject to a programme of archaeological investigation and any further development would not have any impact. The historic estate of Downes lies to the north east of the site though the intervening topography screens the park from any potential impact as a result of developing this site. No impact is anticipated.	0
C) Mitigating the effects of climate change	The site is located in close proximity to the flood zones associated with the River Yeo. Flood zone 3 lies to the south of the site, whilst zone 2, crosses over a small part of the sites south eastern boundary. The policy requires areas within the flood zone to be retained as green infrastructure. The policy also requires the inclusion of a sustainable urban drainage scheme on site. Inclusion of such a proposal should ensure the retention of any surface water on site, in order to avoid off-site impacts. This is considered to mitigate any negative flood risk impact associated with developing the site.	0
D) Safeguarding and minimising	This is a greenfield site which is agricultural grade 3. This is the most common grade found throughout the district, accounting for approximately 64% of all land. Though of reasonable quality, its loss is only considered to be a slight negative impact.	-1

resource use		
E) Promoting economic growth and employment	The policy contains provision for over 5,800 square metres of employment floorspace. Crediton has had limited employment development within recent years, and this site could meet a large proportion of the town's employment needs and creating local jobs.	+2
F) Supporting retail	The policy contains no specific retail proposals, however, retail does fall within the overall definition of commercial development. It is possible, therefore, that retail proposals could come forward on these sites if allocated. However, the any such proposals would also need to be considered against the sequential test set down in the 'Development outside town centres' policy. This should mitigate against any harmful impacts against existing retail.	0
G) Meeting housing needs	The policy contains no housing proposals. No impact is anticipated.	0
H) Ensuring community health and wellbeing	Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. Option will contribute towards light and noise pollution, a slight negative effect. The site is located off the A377, in close proximity to the proposed link road which is currently under construction. Employment traffic generated by the site will be able to make use of the link road (when heading towards Tiverton), or via the A377 direct to Exeter, only needing to drive through the town centre when heading west along the A377. There will likely be some negative off-site air quality impacts as a result however.	-2
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network, with the site being able to make use of the link road once complete. Overall, the infrastructure is already in place, or nearing completion.	0

Secondary/cumulative/synergistic effects:	The development will help meet the employment needs in Crediton. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within the town. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs within Crediton. Development would be focussed in Crediton, the third town in the district.

Summary of Recommendations

1. No recommendations following SA.

Villages Site Options

Land at M5 Junction 27 and adjoining Willand (Commercial)

Option

A site of 96 hectares between M5 Junction 27 and Willand could be allocated for mixed commercial floorspace including transport provision, environmental protection, community facilities, carbon reduction and air quality improvements, an agreed phasing strategy and public master planning exercise.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are some important trees to the north of the site and in close proximity to a number of TPOs. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. Development of this scale would have a significant impact on existing landscape character, altering the rural quality of the entrance into Mid Devon from the M5 and the rural character around Willand and Sampford Peverell. Some parts of the site are more enclosed and shielded from wider views than others. Some land around the A38 appears elevated and has far reaching views. Around Pitt Farm, there are undulating fields and a significant drop in ground level towards the motorway, with wide landscape views to the other side of the valley. Full Landscape and Visual Impact Assessment (LVIA) would determine impacts further. Given the scale of development it can be assumed that some negative impact will be encountered.	-2
B) Protection and promotion of a quality built and historic environment	There could be a wider impact on Willand and Sampford Peverell built environments, including the setting of the Sampford Peverell Conservation Area, a slight negative effect. The policy requires a public Masterplanning exercise to be undertaken before any planning application is made and which will improve the quality of the final design of the development. This site occupies a substantial area within a landscape that has evidence of prehistoric and Roman activity. Any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it, a slight negative effect.	-1
C) Mitigating the effects of climate change	The site contains a number of small streams and is in close proximity to the flood plain but is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, the provision of Sustainable Urban Drainage Scheme to deal with all surface water from the development is expected an overall neutral effect.	0
D) Safeguarding and minimising resource use	Part of Junction 27 lies within the Mineral Consultation Area for Hillhead Quarry. Of this, only a small area sits above the sand and gravel mineral resource, but there is a likelihood that development of the site may constrain future working of the remaining permitted reserves within Hillhead Quarry which extend up to the eastern boundary of Junction 27, a slight negative effect. The site is located on mainly greenfield land with a small portion on brownfield land which is considered to be negative impact on resource use a negative effect. A small area of 2.6ha to the (2.7%) east and south of the site is located on Grade 3 good / moderate quality agricultural land with the remaining 96ha (95.3%) located on Grade 4 poor quality agricultural land.	-1

	Given the large scale loss of poor quality agricultural land and greenfield land an overall minor negative effect is considered.	
E) Promoting economic growth and employment	This option provides 96 ha of commercial floorspace helping to diversify the economy and encourage inward investment, a significant positive effect. The policy notes development might comprise 25ha for B8 storage and distribution / logistics, 13ha outdoor leisure destination, 8 ha for designer retail outlet/village, 4.5ha Devon produce promotion centre, 3.4ha sports and activities centre including associated retail, 3ha plant / horticultural, 2.4ha cinema, 1.9ha motorway service area, parking and refuelling services, 1.8ha hotel, conference venue and concert hall and 0.8ha for regional visitor centre. Development in this location and at this scale has the potential to bring major inward investment and job creation for Mid Devon and the wider region. Development will need to recognise impacts could therefore be regional too.	+3
F) Supporting retail	The delivery of 96ha of mixed commercial floorspace will be subject to an impact assessment which will need to demonstrate no adverse impact on town centre vitality and viability at a sub-regional level, an uncertain effect at present.	?
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	The site is remote from existing services/facilities however development on this scale would entail the provision of supporting services/facilities. The southern parts of the site does however have reasonable access to Willand's limited services, including; Shop, Primary school, Doctors' surgery, Mobile library service, Village hall, Pub, Post office, Daily bus service and Petrol stations. To the north of the site there is a garden centre and the existing motorway service area, which includes a petrol station, shop, hotel and fast-food restaurant. The train station is accessible by cycle path and by car. The policy option includes leisure and community uses including a major outdoor and indoor leisure attraction and cinema that could serve the local community. The policy seeks Carbon reduction and air quality improvements, a positive effect. Given the sites remote location but critical development mass capable of supporting services and facilities a significant positive effect is considered. A Masterplanning exercise will be undertaken before any planning application is made to ensure that essential services and facilities are delivered at the right time and in the right location.	+3
I) Delivering the necessary infrastructure	The policy seeks appropriate transport provision to ensure appropriate accessibility for all modes, improvement to Junction 27 of the M5 motorway and provision of dedicated pedestrian and cycle route to the Tiverton Parkway railway Station. Development will also be expected to include environmental protection and enhancement including Strategic Green Infrastructure which delivers multiple environmental benefits. Development will be expected to be brought forward through a Masterplanning process and agreed phasing strategy to ensure infrastructure remains in step with overall viability of development. Further assessment work is needed to identify the transport impact, sustainable transport options and strategic infrastructure requirements, the SA will be updated as this information becomes available, an uncertain effect. Essential service infrastructure including; water supply, sewage works capacity, gas and electricity will need to be determined as deliverable, once further information is received, the results will be used to update this sustainability appraisal accordingly.	?

Secondary/cumulative/synergistic effects:	The Highways Agency require improved capacity infrastructure for Junction 27. The site is of such a scale, it could be considered a new settlement. Matching neighbouring housing density is not so relevant in this case, especially as the site abuts Willand's employment land rather than housing. Development should achieve a satisfactory relationship between housing and employment land. Density and distribution of uses would be determined through a Masterplanning exercise.
Temporary/permanent effects:	Development will occur throughout the lifetime of the plan and the effect should be considered permanent.

Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	
Spatial extent: (District wide / local)	The policies set seek to meet the development needs of the District and wider region.

Summary of Recommendations

The final policy would be supplemented by a suite of detailed policies on the issues listed below.

1. Transport provision
2. Environmental protection and green infrastructure
3. Landscape and Visual Impact Assessment
4. Archaeological investigation & protection of listed buildings
5. Flood mitigation & Sustainable Urban Drainage (SUD)
6. Community facilities
7. Carbon reduction & air quality
8. Construction impact and the treatment of waste
9. Masterplanning & phasing

Land at M5 Junction 27 and adjoin Willand (Residential)

Option

A site of 110 hectares between M5 Junction 27 and Willand could be allocated residential development; 3,000 dwellings including transport provision, environmental protection, community facilities, carbon reduction and air quality improvements, an agreed phasing strategy and public master planning exercise.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are some important trees to the north of the site and in close proximity to a number of TPOs. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is	-2

	agriculturally prosperous. Development of this scale would have a significant impact on existing landscape character, altering the rural quality of the entrance into Mid Devon from the M5 and the rural character around Willand and Sampford Peverell. Some parts of the site are more enclosed and shielded from wider views than others. Some land around the A38 appears elevated and has far reaching views. Around Pitt Farm, there are undulating fields and a significant drop in ground level towards the motorway, with wide landscape views to the other side of the valley. Full Landscape and Visual Impact Assessment (LVIA) would determine impacts further. Given the scale of development it can be assumed that some negative impact will be encountered.	
B) Protection and promotion of a quality built and historic environment	The site contains a listed building. There could be a wider impact on Willand and Sampford Peverell built environments, including the setting of the Sampford Peverell Conservation Area, a slight negative effect. The policy requires a public Masterplanning exercise to be undertaken before any planning application is made and which will improve the quality of the final design of the development. This site occupies a substantial area within a landscape that has evidence of prehistoric and Roman activity. Any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it, a slight negative effect.	-1
C) Mitigating the effects of climate change	The site contains a number of small streams and is in close proximity to the flood plain but is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, the provision of Sustainable Urban Drainage Scheme to deal with all surface water from the development is expected an overall neutral effect.	0
D) Safeguarding and minimising resource use	The site is located on mainly greenfield land with a small portion on brownfield land which is considered to be a negative impact on resource use a negative effect. A small area of 4.6 ha to the (4.2% east and south) of the site is located on Grade 3 good / moderate quality agricultural land with the remaining 110ha (95.8%) located on Grade 4 poor quality agricultural land. Given the large scale loss of poor quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	The site is remote from existing retail services however development on this scale would entail the provision of supporting facilities, a neutral effect.	0
G) Meeting housing needs	Option provides for 3,000 new dwellings a significant contribution towards future housing need of which 35% should be affordable, a significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+3
H) Ensuring community health and wellbeing	The site is remote from existing services/facilities however development on this scale would entail the provision of supporting services/facilities. The southern parts of the site does however have reasonable access to Willand's limited services, including; Shop, Primary school, Doctors' surgery, Mobile library service, Village hall, Pub, Post office, Daily bus service and Petrol stations. To the north of the site there is a garden centre and the existing motorway service area, which includes a petrol station, shop, hotel and fast-food restaurant. The train station is accessible by cycle path and by car. The policy seeks Carbon reduction and air quality improvements, a positive effect. Given the sites remote location but critical development mass capable of supporting services and facilities a significant positive effect is considered. A Masterplanning exercise will be undertaken before any planning application is made to ensure that essential services and facilities are delivered at the right time and in the right location.	+3

I) Delivering the necessary infrastructure	There is limited capacity to support this development, at present however on the assumption it is a relatively large development, a new primary school may be required given constraints on other schools in the area. Uffculme school is the secondary school for this area. The policy seeks community facilities to meet local needs arising from the housing development, a neutral effect. The policy seeks appropriate transport provision to ensure appropriate accessibility for all modes, improvement to Junction 27 of the M5 motorway and provision of dedicated pedestrian and cycle route to the Tiverton Parkway railway Station. Development will also be expected to include environmental protection and enhancement including Strategic Green Infrastructure which delivers multiple environmental benefits. Development will be expected to be brought forward through a Masterplanning process and agreed phasing strategy to ensure infrastructure remains in step with overall viability of development. Further assessment work is needed to identify the transport impact, sustainable transport options and strategic infrastructure requirements, the SA will be updated as this information becomes available, an uncertain effect. Essential service infrastructure including; water supply, sewage works capacity, gas and electricity will need to be determined as deliverable, once further information is received, the results will be used to update this sustainability appraisal accordingly.	?

Secondary/cumulative/synergistic effects:	The Highways Agency require improved capacity infrastructure for Junction 27. The site is of such a scale, it could be considered a new settlement. Matching neighbouring housing density is not so relevant in this case, especially as the site abuts Willand's employment land rather than housing. Development should achieve a satisfactory relationship between housing and employment land. Density and distribution of uses would be determined through a Masterplanning exercise.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan and the effect should be considered permanent.
Spatial extent: (District wide / local)	The policies set seek to meet the development needs of the District.

Summary of Recommendations

Justification: The final policy would be supplemented by a suite of detailed policies on the issues listed below.

1. Transport provision
2. Environmental protection and green infrastructure
3. Landscape and Visual Impact Assessment
4. Archaeological investigation & protection of listed buildings
5. Flood mitigation & Sustainable Urban Drainage (SUD)
6. Community facilities

7. Carbon reduction & air quality
8. Construction impact and the treatment of waste
9. Masterplanning & phasing

Bourchier Close, Bampton

Option

Land with a gross site area of 2.4 (ha) at Bourchier Close, Bampton is proposed for 40 dwellings & 4,000 sqm floor space.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are no environmental designations within or adjacent the site, although the area is defined by Devon Biodiversity Record Centre as being of wildlife interest as a result of the site being comprised of 'semi-improved natural grassland/unimproved marshy grassland', a negative effect. At this stage, the Council is not aware of the presence of protected species. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Upper farmed and wooded valley slopes' landscape character area. The majority of this type of landscape drains into the Exe Valley and is characterised by lush and fertile land giving rise to extensive tracts of medium scale fields of permanent pasture. The element of the site adjoining the road would have a lesser impact than the western site, which is much more steeply sloping. The Inspector's Report in 2010 noted that the development of the whole site would cause visual impact into the countryside outside the existing settlement although this would be contained by topography and potential screen planting, and concluded that allocating the site was justified. Given the negative effects on the site with regards to biodiversity and landscape impact but mitigation available, an overall negative effect is considered.	-2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 1.1ha (73% eastern part) of the site is located on Grade 3 good / moderate quality agricultural land, 0.4ha (27% western part) is located on Grade 4, poor quality agricultural land, a slight negative effect. Given the loss of good / moderate quality agricultural land and greenfield land, a slight negative effect is considered.	-1
E) Promoting	Option provides 4,000 sqm of commercial floorspace helping to diversify the economy and encourage inward investment, a positive	+2

economic growth and employment	effect.	
F) Supporting retail	The policy contains no retail proposal, however the high street is in relative close proximity to the site, and would benefit from the custom of the residents from this development. There would be a small positive effect.	+1
G) Meeting housing needs	Option provides for 40 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Bampton has a reasonable range of services. The existing pedestrian access to the town centre is poor, with no continuous pedestrian footpath along either the B3190 or Frog Street. Frog Street is relatively lightly trafficked and provides a direct route to the town centre from the site and is therefore the preferred pedestrian route. Frog Street is narrow with many dwellings directly fronting the highway. The upper part of the street is bounded by mature hedging which would not be desirable to lose. These factors make the widening of Frog Street difficult. Development will be expected to include measures that discourage additional vehicular use of Frog Street whist at the same time making the highway safer for use. Site will require improvements to cycling and pedestrian safety to the town centre along Frog Street, a negative effect. The allocation of commercial land within Bampton could decrease air quality within the settlement through increased traffic movement and in particular HGV movements, a negative effect. Given the sustainable location for walking but the need for improvements for pedestrian safety and potential for harm to air quality an overall negative effect is considered.	-2
I) Delivering the necessary infrastructure	Site will require measures to discourage additional vehicular use of Frog Street, a negative effect. Primary school has recently been expanded to support increased numbers in area and existing consents. School can be expanded by one additional classroom but is an expensive solution given site constraints, a slight negative effect. Given the road impact on Frog Street and education requirements, an overall negative effect is considered.	-2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bampton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing & employment needs of Bampton.

Summary of Recommendations

1. 35% affordable housing
2. Measures to discourage additional vehicular use of Frog Street and providing improvements to cycling and pedestrian safety to the town centre along Frog Street.

3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
4. Contributions to improvements in public transport links.

Justification: The final policy would be supplemented by a criteria based policy similar to that already adopted (existing Policies AL/BA/2).

Newton Square, Bampton

Option

Land with a gross site area of 0.2 (ha) at Newton Square, Bampton is proposed for 8 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is within the centre of a settlement and there is likely to be no impact on landscape character, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	Most of the site falls within the Bampton Conservation Area a slight negative effect. There are many listed buildings within the centre of Bampton, though these are not likely to be affected by developing this site, a neutral effect. The site lies in an area of archaeological potential within the historic core of Bampton. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required. Given the site falls within a Conservation Area and an area of archaeological potential an overall negative effect is considered.	-2
C) Mitigating the effects of climate change	0.2 ha (67% South West) of the site is located in flood zone 1 and 0.1ha (33% North East) of the site is located in Flood zone 2, a negative effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-2
D) Safeguarding and minimising resource use	Development option is located on brownfield land, a positive effect.	+2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	The policy contains no retail proposal, however the high street is in relative close proximity to the site, and would benefit from the custom of the residents from this development. There would be a small positive effect.	+1
G) Meeting housing needs	Option provides for 8 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Bampton has a reasonable range of services and frequent bus services, a slight positive effect. The site is also in walking distance to services.	+1

I) Delivering the necessary infrastructure	Site access is achievable from Newton Court, a positive effect. Primary school has recently been expanded to support increased numbers in area and existing consents. School can be expanded by one additional classroom but is an expensive solution given site constraints, a slight negative effect. Given a road access is achievable but there are issues around education requirement, a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bampton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bampton.

Summary of Recommendations

1. 35% affordable housing
2. Allocated provision is made on site for parking of delivery vehicles serving the convenience store at 4-6 Newton Square.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
4. Archaeological investigation and appropriate mitigation measures.

Justification: The final policy would be supplemented by a criteria based policy similar to that already adopted (existing Policies AL/BA/4).

South of Molton Road, Bampton

Option

Land with a gross site area of 4 (ha) at South of Molton Road, Bampton is proposed for 80 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are a number of important trees within the site, of which 17 are covered by TPOs (all of these are within the eastern field), a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'River valley slopes and coombes' landscape character area, which are defined as having steeped, often wooded sides. In the upper valleys, such sites have a strong sense of enclosure. This site would be highly visible from the ridge to the south west and the ridge to the north west due to the steep sloping nature of the site. Development within this site would also	-2

	be visible from South Molton Road, a negative effect. Given the negative effects on the site with regard to the potential loss of trees and landscape impact an overall negative effect is considered.	
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. Site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and greenfield land, a negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	The policy contains no retail proposal, however the high street is in relative close proximity to the site, and would benefit from the custom of the residents from this development. There would be a small positive effect.	+1
G) Meeting housing needs	Option provides for 80 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	The site is located about 500m from the town centre although footway provision and widening will be required. Bampton has a reasonable range of services and frequent bus services, a positive effect.	+2
I) Delivering the necessary infrastructure	Accesses from the B3227 and High Street/C796 are achievable, but the site is steep which would limit suitable access points and highway layout, a slight negative effect. Primary school has recently been expanded to support increased numbers in area and existing consents. School can be expanded by one additional classroom but is an expensive solution given site constraints, a slight negative effect. Given a road access is achievable but steep and the education requirement, an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bampton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bampton.

Summary of Recommendations

1. 35% affordable housing.
2. Footway provision and widening will be required.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Justification: The final policy would be supplemented by a criteria based policy.

Land at Ball Hill, Bampton

Option

Land with a gross site area of 0.5 (ha) at Land at Ball Hill, Bampton is proposed for 16 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is not classed as a landscape character area, falling with the 'main cities and towns' area. The site in part is largely shielded by its high hedges and trees, however development would overlook the adjacent lane. Also, the southern part lies on the western slope of the Batherm Valley, would be open to some views from the south, with landscape impacts expected as a result, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. Site is located on Grade 4 poor quality agricultural land, a slight positive effect. Given the loss of only poor quality agricultural land but loss of greenfield land, a neutral effect is considered.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting	The policy contains no retail proposal, however the high street is in relative close proximity to the site, and would benefit from the	+1

retail	custom of the residents from this development. There would be a small positive effect.	
G) Meeting housing needs	Option provides for 16 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	The site is located about 600m from the town centre and for the most part there are footway links to the town centre. Bampton has a reasonable range of services and frequent bus services, a slight positive effect. The site is adjacent to sewerage works and there will be concerns of the impact of odours on residential amenity, a negative effect. Given the slight positive and negative effects an overall neutral effect is considered.	0
I) Delivering the necessary infrastructure	West Street is of limited width but would be subject to improvement should the site south of Bampton School be developed. The site access is achievable off the existing highway, a neutral effect. Primary school has recently been expanded to support increased numbers in area and existing consents. School can be expanded by one additional classroom but is an expensive solution given site constraints, a slight negative effect. Given a road access is achievable although narrow but there are issues around education requirement, an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bampton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bampton.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Stone Crushing Works (Scotts Quarry), Bampton

Option

Land with a gross site area of 0.45 (ha) at Stone Crushing Works (Scotts Quarry), Bampton is proposed for a mixed use of 18 residential dwellings and 355 sqm commercial floorspace.

Sustainability objective	Commentary	Impact
A) Protection of	The site does not fall within a landscape character area, simply being classed as 'main cities and towns'. The presence of the	0

the natural environment	existing development on the adjoining employment and housing development already provides a level of mitigation against any impact. The site is very enclosed by the boundary trees with only short views into and from the site permitted. The impact would be very limited.	
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a neutral effect.	0
D) Safeguarding and minimising resource use	The site falls within a mineral consultation zone. The immediately adjacent units are for employment use. The remainder of the site is a spoil heap. The history of quarrying at the site highlights the possibility of the presence of contaminated land. Developing the site would require removal of the large spoil heap, a negative effect.	-2
E) Promoting economic growth and employment	The site is currently allocated for 0.45ha of employment space. Developing it solely for housing would see the employment element lost, a negative effect.	-2
F) Supporting retail	The policy contains no retail proposals, however the high street is in relative close proximity to the site, and would benefit from the custom of the residents from this development. There would be a small positive effect.	+1
G) Meeting housing needs	Option provides for 18 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	There may be concerns with locating housing the other side of the existing employment site, where the amenity of residents could be affected by employment activities, e.g. noise levels, deliveries etc. The site is close to the town centre with pedestrian and cycle links across the disused railway bridge to Station Road. Bampton has a reasonable range of services and frequent bus services, with new development supported by existing services, a slight positive effect. There could be negative impacts associated with HGVs accessing the site and driving through the centre of the village, potentially affecting air quality. Given the balance of issues, an overall neutral effect has been assumed.	0
I) Delivering the necessary infrastructure	The site has an existing access which services Woodland Close, a positive effect. Primary school has recently been expanded to support increased numbers in area and existing consents. School can be expanded by one additional classroom but is an expensive solution given site constraints, a potentially negative effect. Given that a road access is in place but education requirement an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic congestion.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bampton. Once completed the development will be permanent.

Spatial extent: (District wide / local)	This site option will help meet the housing and employment needs of Bampton.

Summary of Recommendations

1. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Former School, School Close, Bampton

Option

Land with a gross site area of 0.54 (ha) at the Former School, School Road, Bampton is proposed for 26 residential dwellings. .

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	An oak tree that sits within the boundary of the site should be retained. There are views over the town to the north and east, hedges and tress along Ball Hill mark the skyline to the south of the site. Wildlife corridors can be established through the site and the adjacent old school to enhance biodiversity. An ecological survey in 2009, note that dormice are known to be present in this part of Devon, rabbit tracks have been found but no badgers. Given mitigation measures proposed an overall neutral effect is considered. The site falls within the 'River valley slopes and coombes' landscape character area, which are defined as having steeped, often wooded sides.	0
B) Protection and promotion of a quality built and historic environment	The development site is not within or near the Bampton Conservation Area and development will not impact upon any Listed Buildings, a neutral effect.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	This is a Greenfield site currently used as pastureland which is considered to be negative impact on resource use. 0.13ha is Grade 3 good / moderate quality agricultural land and 0.41ha is Grade 4 poor quality agricultural land. Given the loss of mainly poor quality agricultural land an overall neutral effect is considered.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	The policy contains no retail proposals, however the high street is in relative close proximity to the site, and would benefit from the custom of the residents from this development. There would be a small positive effect.	+1
G) Meeting	Option provides for 26 new dwellings a contribution towards future housing need, a positive effect. The quality of the final design	+2

housing needs	of the development will be guided by other policies within the local plan including Policy DM2 High Quality Design.	
H) Ensuring community health and wellbeing	Bampton has a reasonable range of services and frequent bus services, a slight positive effect. The school is adjacent the site enabling public to walk, new development supported by existing services a positive effect.	+2
I) Delivering the necessary infrastructure	The site would gain vehicular access via West Street which on its approach to the site is narrow and has no pedestrian facilities. It may be possible to provide a footway/cycleway access between the site and School Close passing though the adjacent old school site. The feasibility of the carriageway link to the adjacent site has been considered and is acceptable, a positive effect. Primary school has recently been expanded to support increased numbers in area and existing consents. School can be expanded by one additional classroom but is an expensive solution given site constraints, a slight negative effect. Given site access is achievable but education capacity a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic congestion.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bampton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs of Bampton.

Summary of Recommendations

1. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Ashleigh Park, Bampton

Option

Land with a gross site area of 0.3 (ha) at Ashleigh Park, Bampton is proposed for seven residential dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Upper farmed and wooded valley slopes' landscape character area. The majority of this type of landscape drains into the Exe Valley and is characterised by lush and fertile land giving rise to extensive tracts of medium scale fields of permanent pasture however the site is located within the fold of the hill and development here would have minimal impact, a neutral effect.	0
B) Protection and promotion of a	The development site is not within or near the Bampton Conservation Area and development will not impact upon any listed buildings, a neutral effect.	0

quality built and historic environment		
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	The site is located in the Minerals Consultation Zone for Kersdown Quarry, as such development in this location could compromise minerals resources, a slight negative effect. 0.12 ha is Grade 3 good / moderate quality agricultural land and 0.12 ha is Grade 4 poor quality agricultural land. Given the small scale of the site and only the loss of good / moderate / poor quality agricultural land an overall neutral effect is considered.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	The policy option has no retail element and the scale of development would be unlikely to benefit the local high street, a neutral effect.	0
G) Meeting housing needs	Option provides for 7 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Bampton has a reasonable range of services and frequent bus services, a slight positive effect.	+1
I) Delivering the necessary infrastructure	An adequate site access is achievable, a positive effect. Primary school has recently been expanded to support increased numbers in area and existing consents. School can be expanded by one additional classroom but is an expensive solution given site constraints, a slight negative effect.	+2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic congestion.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bampton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs of Bampton.

Summary of Recommendations

1. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land south of Glen View, Bickleigh

Option

Land with a gross site area of 1.42 (ha) at Land south of Glen View, Bickleigh is proposed for 45 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'River valley slopes and coombes' landscape character area. These areas are typified by their close proximity to the River Exe, and are largely comprised of steep, wooded valley sides, often with a strong sense of enclosure. Developing this site would change the context of the landscape, particularly when viewed from the west, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	The site is within the Bickleigh Conservation Area and there are a number of listed buildings within close proximity to the site, a slight negative effect. Development on this site would be visible from Bickleigh Castle, a slight negative effect. Overall as there is potential impact on the Conservation Area, a number of listed buildings and Bickleigh Castle a negative effect is considered.	-2
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 1.35 ha (96% East) is located on Grade 3 good / moderate quality agricultural land and 0.05ha (4% West) is located on Grade 4 poor quality agricultural land. Given the loss of good / moderate quality agricultural land but greenfield land, a slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 45 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	There is a bus stop in Bickleigh, which is walkable, but quite far with an hourly or greater bus service on the A396, a slight positive effect.	+1
I) Delivering the necessary infrastructure	With careful location an adequate site access from the A396 is achievable. Access is only feasible from the East lane, and access would result in the loss of part of the hedgerows. The C103 is narrow and has restrictive alignments. Primary school is forecast to have some spare capacity to support development but is on a constrained site and cannot be easily expanded, a slight negative effect. Given a road access is achievable but has restrictive alignments and the issues around education capacity, an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	None anticipated.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bampton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bickleigh.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Protection of listed buildings.

West of Godfrey Gardens, Bow

Option

Land with a gross site area of 0.23 (ha) at Land south of Glen View, Bow is proposed for 6 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is within the 'Lower rolling farmed and settled valley slopes' character area, which is characterised by being a gently rolling and strongly undulating landscape which is intensively farmed. The site is largely shielded from views from the south due to existing hedgerows, a neutral effect. The steep topography to the north also reduces views from that direction. There is medium housing to the East, and low density housing located to the West of the site. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential, with prehistoric settlement and funerary activity recorded in the vicinity, a negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, a neutral effect. There are no historic designations within the site, although there are various listed buildings in the centre of Bow, given the negative effects but mitigation measures available an overall slight negative effect is considered.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1

D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural, a slight negative effect as the site is relatively small. Given the loss of good / moderate quality agricultural land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 6 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Bow has a reasonable convenience store and access to a bus service is available on the A3072, a slight positive effect. Other services require travel. The site has access to an existing footway and on-road cycle links, a further slight positive effect.	+1
I) Delivering the necessary infrastructure	The site is presently accessed from Bow Mill Lane which is a quite narrow, one vehicle width lane. Access from Godfrey Gardens only as Mill Lane has restrictive alignment and width, a slight negative effect. There is a clawback provision for this site, this amounts to approximately 30% of the difference between the agricultural land value and the developed land value, a neutral effect. Bow has limited spare capacity for Education facilities in the future although a low level of development could be supported within existing infrastructure, a neutral effect. Given access difficulties through a restrictive alignment and road width a slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bow. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bow.

Summary of Recommendations

1. Site carried forward as an affordable housing rural exception site.
2. Mitigation of any wildlife impact including protection of trees and hedgerows.
3. Provision of a pedestrian route linking Godfrey Gardens with Bow Mill Lane.

4. Archaeological investigation and appropriate mitigation measures.
5. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

The final policy would be supplemented by a criteria based policy like existing Local Plan Policy (AL/BO/1).

Land adjacent Bow Mill Lane, Bow

Option

Land with a gross site area of 2.17 (ha) at Land adjacent Bow Mill Lane, Bow is proposed for 52 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are tree preservation orders on one tree in the northern part, and another along the eastern boundary, a slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site is within the 'Lower rolling farmed and settled valley slopes' landscape character area, which is characterised by being a gently rolling and strongly undulating landscape which is intensively farmed. The south end of the site is largely shielded from views further to the south, west and north but the high boundary hedging. The northern part of the site slopes steeply and is highest part, and would be more prominent in the landscape, a negative effect. Housing on this part would be visible from the south, north and west. The adjacent housing to the east would provide some level of mitigation. Given the potential loss of trees and impact on landscape against mitigation measures, an overall slight negative effect is considered.	-1
B) Protection and promotion of a quality built and historic environment	This site occupies a large area in a landscape where prehistoric settlement and funerary activity is recorded in the vicinity, a negative effect. Any planning application for development here should be supported by a programme of archaeological work to allow the impact of the development upon the heritage asset to be understood, a neutral effect. English Heritage may need to be consulted with regard to the impact of the development upon the setting of the Scheduled Monuments to the west. Given the potential of archaeological impact against mitigation measures, an overall slight negative effect is considered.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural, a negative effect. Given the loss of good / moderate quality agricultural land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting	No impact.	0

retail		
G) Meeting housing needs	Option provides for 52 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Bow has a reasonable convenience store and access to a reasonable bus service is available on the A3072, a slight positive effect. Other services require travel. The site has access to an existing footway and on-road cycle links, a further slight positive effect.	+1
I) Delivering the necessary infrastructure	The site is presently accessed from Bow Mill Lane which is a quite narrow, one vehicle width lane. Access from Godfrey Gardens only as Mill Lane has restrictive alignment and width, a slight negative effect. There is a clawback provision for this site, this amounts to approximately 30% of the difference between the agricultural land value and the developed land value, a neutral effect. Bow has limited spare capacity for Education facilities in the future although a low level of development could be supported within existing infrastructure. Given access difficulties through a restrictive alignment and road width and potential issues around education requirement a slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bow. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bow.

Summary of Recommendations

1. 35% affordable housing.
2. Archaeological investigation and appropriate mitigation measures.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

East Langford Farm, Bow

Option

Land with a gross site area of 1.3 (ha) at East Langford Farm, Bow is proposed for 25 dwellings.

Sustainability objective	**Commentary**	**Impact**

A) Protection of the natural environment	The site is within the vicinity of the Nymet Barton Marsh SSSI, a slight negative effect. At this stage, the Council is not aware of the presence of protected species. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site is classified as 'Lower rolling farmed and settled valley slopes', which is characterised by being a gently rolling and strongly undulating landscape which is intensively farmed, a slight negative effect.	-1
B) Protection and promotion of a quality built and historic environment	This site occupies an area in a landscape where prehistoric settlement and funerary activity is recorded in the vicinity, a slight negative effect. Any planning application for development here should be supported by a programme of archaeological work to allow the impact of the development upon the heritage asset to be understood. Given the potential of archaeological impact against mitigation measures, an overall slight negative effect is considered.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 very good quality agricultural, a negative effect. Given the loss of very good quality agricultural land, an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 25 new dwellings a contribution towards future housing need, a significant positive effect. Option would require the demolition of two homes to make an access onto Tree Park, a negative effect. Given the overall net gain of 23 new dwellings a positive effect is considered.	+2
H) Ensuring community health and wellbeing	Bow has a reasonable convenience store and access to a bus service is available on the A3072, a slight positive effect. Other services require travel.	+1
I) Delivering the necessary infrastructure	Bow has limited spare capacity for Education facilities in the future although a low level of development could be supported within existing infrastructure. Highways Authority visited Iter Close and have concluded that the site could be accessed from there for a small number of dwellings however it would be dependent on land in the control of both number 1 and 2 in the south west corner. This solution would only serve a small increase of up to 25 dwellings. Existing estate has issues with parking particularly on the bend to the north of the play area which causes a restriction, therefore a suitable level of parking need to be imposed. Option would require the demolition of two homes to make an access onto Tree Park, a negative effect. Given access difficulties and the issues around education requirement a negative effect is considered.	-2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon

	traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bow. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bow.

Summary of Recommendations

1. 35% affordable housing.
2. Archaeological investigation and appropriate mitigation measures.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land adjacent Hollywell, Bow

Option

Land with a gross site area of 1.47 (ha) at Land adjacent Holywell, Bow is proposed for 25 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape that is intensively farmed. The site is exclusively flat and the boundary hedges provide a significant amount of screening, a neutral effect. Despite the gently rolling nature of the farmland to the southern side of the village, there are few opportunities for views into the sight from the west, east and south due to the screening effect of the existing boundary. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential, with prehistoric settlement and funerary activity recorded in the vicinity, a slight negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted will be required.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1

D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 very good quality agricultural land, a negative effect. Only 11% of land within the district is grade 2. The whole site is within the East Langford Farm Waste Consultation Zone, related to historic landfill sites, and will require Environmental Health to be consulted on site allocations and individual applications, a slight negative effect. Given the loss of very good quality agricultural land, loss of greenfield land and location within the East Langford Farm Waste Consultation Zone, an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 25 new dwellings a contribution towards future housing need, a significant positive effect. Option would require the demolition of one house in the south west corner to make an access onto Station Road, a negative effect. Given the overall net gain of 24 new dwellings a positive effect is considered.	+2
H) Ensuring community health and wellbeing	Bow has a reasonable convenience store and access to a bus service is available on the A3072, a slight positive effect. Other services require travel.	+1
I) Delivering the necessary infrastructure	Bow has limited spare capacity for Education facilities in the future although a low level of development could be supported within existing infrastructure. The private lane to the south of the site is not suitable in its current state to serve development access through Hollywell as it would give rise to multiplicity of accesses and confusion of turning manoeuvers. Access through the building of Hollywell would be feasible to the north west corner and would give adequate separation, but would advise an improvement of the existing road to adoptable standards would be preferable. Dependant on a new access being achieved the site would be able to support approximately 25 dwellings from a shared surface road. Option would require the demolition of one house in the south west corner to make an access onto Station Road, a negative effect. Given access difficulties and issues around education requirement a negative effect is considered.	-2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bow. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bow.

Summary of Recommendations

1. 35% affordable housing.
2. Archaeological investigation and appropriate mitigation measures.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
4. Access through the building of Hollywell and improvement of existing road to adoptable standards.

Land adjacent Jackman Car Park, Bow

Option

Land with a gross site area of 1 (ha) at Land adjacent Jackman Car Park, Bow is proposed for 32 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is open in nature, and slopes steeply down the hillside towards the north. The southern part of the site forms part of the ridge on which the main road through the village lies. There are wide views from the site out towards the wide ridge to the north. From many points along the ridge, the site would also be visible, a negative effect, however some level of mitigation would be provided by the existing built development line which spans along this side of the road. Given the potential for some mitigation, a slight negative effect is considered. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	0.3ha of site is within the conservation area of Bow (30%, the southern part of site). There are many listed buildings within the centre of Bow, a number of which are located in close proximity to the site, particularly on the south side of the main street further west along the road, a slight negative effect. The proposed development lies within an area of archaeological potential, in an area enclosed in the medieval period and in an area where prehistoric activity has been recorded. Archaeological investigations on a development site some 100m to the east revealed the presence of prehistoric activity, consisting of hearths, stakeholes, flint tools and charred food remains, dating to the Neolithic period - 2,200 - 2,000BC - and representing a rare survival of evidence of human activity from this period in the county, a negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted will be required. Given the potential of archaeological impact against mitigation measures, part of the site within a Conservation Area and the potential impact to a number of listed buildings an overall negative effect is considered.	-2
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land, an	-1

resource use	overall slight negative effect is considered.	
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 32 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Bow has a reasonable convenience store and access to a bus service is available on the A3072, a slight positive effect. Other services require travel.	+1
I) Delivering the necessary infrastructure	High level differentials between the main road and the site may restrict access, which may need to cross the existing car park. There is a requirement for a frontage footway, a slight negative effect. Bow has limited spare capacity for Education facilities in the future although a low level of development could be supported within existing infrastructure. Given access difficulties and potential issues around education requirement a slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bow. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bow.

Summary of Recommendations

1. 35% affordable housing.
2. Archaeological investigation and appropriate mitigation measures.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

South of Iter Cross, Bow (Commercial) Option

Land with a gross site area of 0.5 (ha) at South of Iter, Bow is proposed for 1,700 sqm commercial floor space.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is currently part of an open agricultural field which is highly visible from the south, although adjacent development will mitigate impact, a slight negative effect. This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. At this stage, the Council is not aware of the presence of protected species. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	The site contains evidence of prehistoric activity and within a landscape that contains a concentration of prehistoric sites identified by aerial photography. The Historic Environment Team would therefore advise that any planning application for development here must be supported by an appropriate level of information on the impact upon any heritage assets with archaeological interest, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 Excellent quality agricultural land, a negative effect. Given the loss of Excellent quality agricultural land and greenfield land, a negative effect is considered.	-2
E) Promoting economic growth and employment	Option provides 1,700 sqm of commercial floorspace helping to diversify the economy, provide opportunities for local employees, reduce out-commuting and encourage inward investment, a positive effect	+2
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	The site is within walking distance to village centre where there are various facilities and bus route, a slight positive effect. The allocation of commercial land within Bow could decrease air quality within the settlement through increased traffic movement and in particular HGV movements, a negative effect. Given the sustainable location for walking but potential for harm to air quality an overall slight negative effect is considered.	-2
I) Delivering the necessary infrastructure	The site is located on a road just off of the main route through the settlement however there is no access point into the site. Access to the site and the topography of the site may constrain development, a slight negative effect. The site is already allocated and there are no known issues with infrastructure.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic congestion.

Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bow. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs of Bow.

Summary of Recommendations

1. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
2. Archaeological investigation and appropriate mitigation measures.

Justification: The final policy would be supplemented by a criteria based policy.

South West of Junction Road, Bow (Commercial)

Option

Land with a gross site area of 0.6 (ha) at South west of Junction Road, Bow is proposed for 2,100 sqm commercial floor space.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site would be highly visible from the south, although adjacent development will mitigate impact, a slight negative effect. This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. At this stage, the Council is not aware of the presence of protected species. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	The site lies near evidence of prehistoric activity and within a landscape that contains a concentration of prehistoric sites identified by aerial photography. The Historic Environment Team would therefore advise that any planning application for development here must be supported by an appropriate level of information on the impact upon any heritage assets with archaeological interest, a slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 Excellent quality agricultural land, a negative effect. Given the loss of Excellent quality agricultural land and greenfield land, a negative effect is considered.	-2

E) Promoting economic growth and employment	Option provides 2,100 sqm of commercial floorspace helping to diversify the economy, provide opportunities for local employees, reduce out-commuting and encourage inward investment, a positive effect	+2
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	The site is within walking distance to the village centre where there are facilities and bus route, a positive effect. The allocation of commercial land within Bow could decrease air quality within the settlement through increased traffic movement and in particular HGV movements, a negative effect. Given the sustainable location for walking but potential for harm to air quality an overall slight negative effect is considered.	-1
I) Delivering the necessary infrastructure	There is a potential access through the employment site directly to the north, otherwise access would be difficult, a neutral effect.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic congestion.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bow. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs of Bow.

Summary of Recommendations

1. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
2. Archaeological investigation and appropriate mitigation measures.

Hele Road, Bradninch

Option

Land with a gross site area of 0.3 (ha) at Hele Road, Bradninch is proposed for 12 dwellings.

Sustainability objective	**Commentary**	**Impact**
A) Protection of	There is a mature oak tree in the south east side of the site, as well as large mature trees along the boundaries, a slight negative	-1

the natural environment	effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. These areas are typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is an open field, and slopes from the north west to the south east. The site can be viewed from some distance, particularly from the ridge line to the south east, a negative effect. However, the existing adjoining housing already provides a backdrop of built development and would provide a level of mitigation should the site be used for housing. Given the potential for some mitigation, a slight negative effect is considered.	
B) Protection and promotion of a quality built and historic environment	The site lies in an area of archaeological potential demonstrated by the presence of prehistoric sites identified through aerial photography, a negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required. Given the potential of archaeological impact against mitigation measures, an overall slight negative effect is considered.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land, an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 12 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	There is a school and shops close by in the centre of Bradninch however other local services/facilities are limited. The site is served by footways but there are no cycle links. There is a bus shelter and bus stop to the west, adjacent to the site and with an hourly or greater bus service, a slight positive effect. The site is located on a fairly busy road, and the bus stop may need to be moved from its current position of the development is undertaken.	+1
I) Delivering the necessary infrastructure	An adequate access is achievable to the north of the site, a slight positive effect. The primary school is forecast to have some limited spare capacity to support housing development. School has limited capacity to expand further. Given adequate site access but potential issues around education requirement a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	None anticipated.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Bradninch. Once completed the development will be permanent.

Spatial extent: (District wide / local)	This site option will help meet the housing needs of Bradninch.

Summary of Recommendations

1. 35% affordable housing.
2. Archaeological investigation and appropriate mitigation measures.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Churchyard Field, Burlescombe

Option

Land with a gross site area of 0.6 (ha) at Churchyard Filed, Burlescombe is proposed for 10 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. Development on this site would result in the setting of the church, which is currently surrounded by mainly green land, being changed, and would impact the view of the church from the local surrounding roads. To the west the land drops away and offers wide views, which reciprocally when viewed into the site would be seen with the church in the background, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	The site lies in an area of archaeological potential in proximity to the parish church, which is likely to have been the focus of the early settlement at Burlescombe, a negative effect. Any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it, a neutral effect. The site is located in close proximity to the listed church (to the east), and development of the site may negatively impact upon the setting of the building whilst also reducing the openness of the village centre. Given the potential of archaeological disturbance and impact on the setting of the listed church, an overall negative effect is considered.	-2
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. There is contaminated land to the east of the church. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect is considered as the site is relatively small.	-1

E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 10 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Burlescombe is remote from services/facilities and has a less than daily bus service, a negative effect.	-2
I) Delivering the necessary infrastructure	There is poor access to the site, with a telephone wire crossing from the east to west in the northern part of the site and a public right of way on the site as well, which may constrain development, a slight negative effect. An adequate access is achievable as the visibility is not bad due to existing farm access and relatively short road however the access would need to be re-graded, a slight negative effect. Local primary is forecast to have limited spare capacity to support development, the school has very limited capacity to expand. Given site access is achievable but will require work and the potential issues around education requirement a slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	No anticipated impact.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Burlescombe. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Burlescombe.

Summary of Recommendations

1. 35% affordable housing.
2. Archaeological investigation and appropriate mitigation measures.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

North West of Homefield, Butterleigh

Option

Land with a gross site area of 0.7 (ha) at North West of Homefield, Butterleigh is proposed for 10 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This sites falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. There would be a large impact on the landscape character is the site was developed, due to the close proximity of existing dwellings and the views of the site from the south and west which are far reaching, a negative effect. There would also be little mitigation provided by the existing built development, as there are only a small number of dwellings at this part of the village. There is tight access into the site from a gate in the north west corner. To improve the access, some hedgerows would need to be removed. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 very good quality agricultural land, a negative effect. Only 11% of land within the district is grade 2. Given the loss of very good quality agricultural land and loss of greenfield land, an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 10 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Butterleigh is remote from all services/facilities including a bus service and there are no cycle and pedestrian links, a negative effect.	-2
I) Delivering the necessary infrastructure	The local highway network consists of narrow roads having restrictive alignments although an adequate access is achievable from the C31 to the east of the site, a neutral effect. The unclassified road to the west is unsuitable for access to the site. No immediate local school, development will increase the home to school transport costs as no schools are within a safe walking distance. Local school is Bickleigh which is forecast to have some spare capacity to support development but is on a constrained site and cannot be easily expanded. Given site access difficulties and issues around education requirement a negative effect is considered.	-2

Secondary/cumulative/synergistic effects:	No anticipated impact.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Butterleigh. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Butterleigh.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Tower Meadow, Chawleigh Option

Land with a gross site area of 0.4 (ha) at North West of Tower Meadow, Chawleigh is proposed for 16 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Upper farmed and wooded valley slopes' landscape character area. This character area is typified by its steeply rolling landform and lush and fertile land which gives rise to extensive tracts of medium-scale fields. Developing this site would not have a significant impact upon the character of the surrounding landscape as it is enclosed by development, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	The site is located within the Chawleigh Conservation Area where a number of listed buildings lie immediately to the east, including the Church of St James (grade I), a negative effect. The proposed development lies within an apparent enclosed area centred on the church of St James and similar types of enclosed areas elsewhere in the county have been interpreted as the early settlement boundary and, as such, may date to the Saxon or earlier period. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted will be required. Given the potential impact on an area of archaeological potential but mitigation measures available, the potential impact on the Chawleigh Conservation area and Grade I listed building an overall negative effect is considered.	-2
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1

D) Safeguarding and minimising resource use	Development option is located on greenfield land used for growing Christmas Trees, a slight negative effect. The site is located on Grade 3 good / moderate agricultural land, a slight negative effect as the site is relatively small. Given the loss of good / moderate quality agricultural land and loss of greenfield land, an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 16 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Chawleigh has limited services/facilities which would result in the need to travel, a slight negative effect, Chawleigh is served by a limited bus service but Eggesford rail station lies some 3.5 km distant, a slight positive effect. The site has a frontage footway that would require widening and general has access to intermittent footways around the village, a slight negative effect. Given the limited services in the village including access to public transport and footways an overall slight negative effect is considered.	-1
I) Delivering the necessary infrastructure	Access to the site would need to be taken from the unclassified road at the east of the site and is considered achievable, a positive effect. Chawleigh Primary School closed a number of years ago due to lack of school numbers, there is spare capacity in other local schools but development would create additional pressure on home to school transport budget. Given site access is achievable, a positive effect, but there are issues around education travel a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Chawleigh. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Chawleigh.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.
4. Protection of listed buildings.

Barton, Chawleigh
Option

Land with a gross site area of 4.9 (ha) at Barton, Chawleigh is proposed for 40 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Upper farmed and wooded valley slopes' landscape character area. This area is typified by a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. Development on this site would encroach into the open countryside and would create a loss of panoramic views from the northern part of the village that spreads as far as Chawleigh Barton Wood to the north. Restricting development to the south western portion of the site would limit any impact, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	The proposed development site lies in an area of archaeological potential with findspots of prehistoric tools and settlement site located in the wider landscape. The HER also records the presence of a prehistoric burial mound somewhere within the proposed development site. Any planning application should be supported by an appropriate programme of archaeological investigation to allow the significance of the heritage assets within the development site to be understood. The parish church of St James to the south is a Grade I listed building and English Heritage should be consulted with regard to any impact of development here upon the setting of the church. The site also lies on the edge of the Chawleigh Conservation Area. Given the potential impact on an area of archaeological potential but mitigation measures available, the potential impact on the Chawleigh Conservation area and Grade I listed building an overall negative effect is considered.	-2
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and loss of greenfield land, an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 40 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health	Chawleigh has limited services/facilities which would result in the need to travel, a slight negative effect. Chawleigh is served by a limited bus service but Eggesford rail station lies some 3.5 km distant, a slight positive effect. A frontage footway would be	-1

and wellbeing	required, but Chawleigh has intermittent footways in any event. Given the limited services in the village including access to public transport and footways an overall slight negative effect is considered.	
I) Delivering the necessary infrastructure	There is no current access into the site and there is a lack of services and amenities for a large scale development. Access would need to be taken from the unclassified road at the south east corner of the site. This is considered to be achievable. However, the unclassified road is narrow and this would limit the acceptable additional traffic and hence housing numbers. Chawleigh Primary School closed a number of years ago due to lack of school numbers, there is spare capacity in other local schools but development would create additional pressure on home to school transport budget. Given site access is achievable, a positive effect, but there are issues around education travel a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Chawleigh. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Chawleigh.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.
4. Protection of listed buildings.

Cheriton Bishop Glebe, Cheriton Bishop Option

Land with a gross site area of 0.9 (ha) at Cheriton Bishop Glebe, Cheriton Bishop is proposed for 29 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Inland elevated undulating land' landscape character area. This area is typified by its strong cultural association with Dartmoor National Park, forming part of the setting of the moor and is very important to its value and appreciation. The proposed use of the site for housing would be a small extension to the village and would have little impact on the	0

	landscape character of the area, and will not be seen in the wider context of the landscape, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	A stream runs parallel to the northern boundary of the site and the impact of development on the water course may need to be tested through a flood risk assessment. The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on mainly greenfield and includes some public open space, a negative effect. The site is located on Grade 3 good / moderate agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and loss of greenfield land including public open space, an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 29 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Cheriton Bishop has a local convenience store, small school, post office, shop, doctors surgery, public houses and some employment units, a positive effect. Existing footway would need to be extended to serve the site. Other services / facilities require travel, although there is a less than daily bus service, a slight negative effect. The proposed development of this site would result in the loss of an area of existing open space which would need to be relocated, a negative effect. Given the provision of services and facilities but loss of open space an overall neutral effect is considered.	0
I) Delivering the necessary infrastructure	The primary school is at capacity but the school has potential for some limited expansion, a neutral effect. An adequate access is achievable off the main through road however it would require the loss of hedging to provide the necessary visibility, a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure. The cumulative impact of development at Cheriton Bishop could also impact upon the setting of Dartmoor National Park to the south.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Cheriton Bishop. Once completed the development will be permanent.

Spatial extent: (District wide / local)	This site option will help meet the housing needs of Cheriton Bishop.

Summary of Recommendations

1. 35% affordable housing.
2. Relocation of existing open space provision.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land near the church, Cheriton Bishop

Option

Land with a gross site area of 2.9 (ha) at Land near the church, Cheriton Bishop is proposed for 40 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Inland elevated undulating land' landscape character area. This landscape character area has a strong cultural association with the adjacent landscape of Dartmoor, and forms part of its setting. The proposed use of the site for housing will have some impact on the landscape character of the area and will potentially be seen in the wider context of the landscape, particularly given the relationship to the neighbouring national park, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	Adjacent to Cheriton Bishop Conservation Area (which includes the listed church) which the site bounds on three sides. There is likely to be impact on historic built form as the properties will be close to historic buildings. The proposed development lies in an area of archaeological potential in close proximity to the Old Rectory a Grade II* listed building dating to the 14/15th century, a negative effect. English Heritage should be consulted with regard to any impact development here may have on the setting of this protected building. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted will be required. Given the proximity to Conservation Area, Listed Buildings and potential for archaeological impact but mitigation available an overall negative effect is considered.	-2
C) Mitigating the effects of climate change	A stream runs along the north and eastern edge of site. A flood risk assessment may be required to determine the impact of development on the water course. The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising	Development option is located on greenfield land which is considered to be negative impact on resource use. 1.8 (ha) (62% Western part) is located on Grade 3 good / moderate agricultural land and 1.1 (ha) (38% Eastern part) located on grade 4 poor quality agricultural land , a slight negative effect. Given the loss of Grades 3 & 4 agricultural land and loss of greenfield land, an	-1

resource use	overall slight negative effect is considered.	
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 40 new dwellings a contribution towards future housing need, a significant positive effect.	+2
H) Ensuring community health and wellbeing	Cheriton Bishop has a local convenience store, small school, post office, shop, doctor's surgery, public houses and some employment units although the site is a ½ mile walk away, a slight negative effect. Other services / facilities require travel, although there is a less than daily bus service, a slight negative effect. There is no pavement to the edge of the site and Church Lane is a route to the primary school, a negative effect. Given the provision of services and facilities but distance from the site, an overall slight negative effect is considered.	-1
I) Delivering the necessary infrastructure	The primary school is at capacity but the school has potential for some limited expansion, a neutral effect. An adequate access is achievable from the north but it is uncertain if the south site could be adequately accessed via the north. To access the site there may be a need to re-profile the land to provide roadway that would require the loss of hedging to provide the necessary visibility, a slight negative effect. Visibility splays may not be in the control of the land owner and there are overhead power cables that may constrain parts of the site. Given the constraints to site access an overall negative effect is considered.	-2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure. The cumulative impact of development at Cheriton Bishop could also impact upon the setting of Dartmoor National Park to the south.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Cheriton Bishop. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Cheriton Bishop.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land adj Woodleigh Hall, Cheriton Bishop

Option

Land with a gross site area of 9.2 (ha) at Land adjacent Woodleigh Hall, Cheriton Bishop is proposed for 221 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Inland elevated and undulating land' landscape character area. This area is characterised by its strong cultural association with the adjacent landscape of Dartmoor and forms part of its setting. The proposed use of the site for housing will have some impact on the landscape character of the area and will be seen in the wider context of the landscape, particularly given the value this landscape area as the setting of the national park, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	Two listed buildings (Woodleigh Hall and Woodleigh Coach House) sit in land that is adjacent to the site in the south east, a slight negative effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent Listed buildings.	-1
C) Mitigating the effects of climate change	A stream runs along the north west boundary, and flood risk assessment would need to determine whether developing the site would impact upon the watercourse. The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 7.7 (ha) (84% southern part) is located on Grade 3 good / moderate agricultural land and 1.5 (ha) (16% Northern part) located on grade 4 poor quality agricultural land , a negative effect. Given the large scale loss of Grade 3 & 4 quality agricultural land and loss of greenfield land, an overall negative effect is considered.	-2
E) Promoting economic growth and employment	Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+2
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 221 new dwellings a contribution towards future housing need, a significant positive effect. This level of housing provision could be out of scale with the settlement size of Cheriton Bishop and may need to be reduced to reflect the housing demand and need within the village.	+3
H) Ensuring community health and wellbeing	Cheriton Bishop has a local convenience store, small school, post office, shop, doctor's surgery, public houses and some employment units. Other services / facilities require travel, although there is a less than daily bus service, a slight negative effect. Given the provision of services and facilities, an overall neutral effect is considered.	0
I) Delivering the necessary infrastructure	The primary school is at capacity but the school has potential for some limited expansion, a neutral effect. An adequate access is achievable but would require the loss of hedging to provide the necessary visibility and there may be a need to re-profile the land, a slight negative effect. Given the constraints to site access an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure. The cumulative impact of development at Cheriton Bishop could also impact upon the setting of Dartmoor National Park to the south.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Cheriton Bishop. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Cheriton Bishop.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Protection of listed buildings.

Land east of Hill View, Cheriton Bishop

Option

Land with a gross site area of 1.3 (ha) at Land east of Hill View, Cheriton Bishop is proposed for 5 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'inland elevated undulating land' landscape character area. These areas are typified by the repeated patterns of the irregularly hedge enclosed fields and isolation of the far reaching views from higher areas. The site has wide views to the north and is in close proximity to the build environment on the village. The adjacent properties form a linear development along the main road and building on this site would be a continuation of the existing development line, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic	No impact.	0

environment		
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. Site is located on Grade 3 good / moderate agricultural land, a slight negative effect. Given the loss of Grade 3 quality agricultural land and loss of greenfield land, an overall slight negative effect is considered as the site considered is relatively small.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 5 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Cheriton Bishop has a local convenience store, small school, post office, shop, doctor's surgery, public houses and some employment units. Other services / facilities require travel, although there is a less than daily bus service, a slight negative effect. Given the provision of services and facilities, an overall neutral effect is considered.	0
I) Delivering the necessary infrastructure	The primary school is at capacity but the school has potential for some limited expansion, a neutral effect. An adequate access can be formed to serve a small cul-de-sac or frontage development, a neutral effect.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure. The cumulative impact of development at Cheriton Bishop could also impact upon the setting of Dartmoor National Park to the south.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Cheriton Bishop. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Cheriton Bishop.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land north of Brakes View, Cheriton Bishop

Option

Land with a gross site area of 7.7 (ha) at Land north of Brakes View, Cheriton Bishop is proposed for 185 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is located close to a recorded badger sett in the south west corner of the site. At this stage, the Council is not aware of the presence of other protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'inland elevated undulating land' landscape character area. These areas are typified by the repeated patterns of the irregularly hedge enclosed fields and isolation of the far reaching views from higher areas, a negative effect. The site is located close to the existing built environment along the main road and Church Lane. The site is widely visible from the north, though the existing built environment may provide some mitigation an overall slight negative effect is considered.	-1
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	There is a stream running through the centre of the site and along the north eastern edge of the site, and therefore a flood risk assessment would be required. The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. Site is located on Grade 3 good / moderate agricultural land, a negative effect. Given the large scale loss of Grade 3 quality agricultural land and loss of greenfield land, an overall negative effect is considered.	-2
E) Promoting economic growth and employment	The southern part of the site includes the existing farm yard which would need to be relocated if access was required via this point, a slight negative effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact. Overall a neutral effect is considered.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 185 new dwellings a contribution towards future housing need, a significant positive effect. This level of housing provision could be out of scale with the settlement size of Cheriton Bishop and may need to be reduced to reflect the	+3

	housing demand and need within the village.	
H) Ensuring community health and wellbeing	Cheriton Bishop has a local convenience store, small school, post office, shop, doctor's surgery, public houses and some employment units, a neutral effect. Other services / facilities require travel, although there is a less than daily bus service, a slight negative effect. Given the provision of services and facilities, an overall neutral effect is considered. The development option presents the opportunity to integrate the two distinct parts of the village into a single community improving community cohesion.	0
I) Delivering the necessary infrastructure	The primary school is at capacity but the school has potential for some limited expansion, a neutral effect. Access from C500 (main road, running west-east) through existing properties can be achieved, and access from U3707 (Church Lane, running north-south) can also be provided but will require road widening and footway construction over site frontage, a neutral effect. Junction with C50 (main road running west-east) should be assessed for maximum capacities and yields should be determined from these or junction improvements undertaken to cater for increases.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure. The cumulative impact of development at Cheriton Bishop could also impact upon the setting of Dartmoor National Park to the south.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Cheriton Bishop. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Cheriton Bishop.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Cheriton Fitzpaine Glebe, Cheriton Fitzpaine

Option

Land with a gross site area of 2.2 (ha) at Cheriton Fitzpaine, Cheriton Fitzpaine is proposed for 40 dwellings.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	A large protected tree forms a distinctive feature within the field area, on its upper slopes. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The landscape character of the area forms part of a	-2

	predominantly gently rolling and strong undulating landscape in this area. The proposed development will have a major impact on the quality of the landscape in this area and which will also lead to the growth of the village on the upward valley slopes on this side, a negative effect. The topography of the site will be a major constraint due to sloping ground, and the potential loss or damage to the protected tree would also be a constraint.	
B) Protection and promotion of a quality built and historic environment	The site lies close to the Conservation Area and other listed buildings; its development will impact on the historic built form, a slight negative effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent Conservation Area and other listed buildings.	-1
C) Mitigating the effects of climate change	A river runs along northern boundary of the site. 1.9ha (87% South) of the site lies within Flood zone 1 and 0.3ha (13% North) lies within Flood zone 2 and 3, a slight negative effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. Loss of 0.4 (ha) (18% south) Grade 2 very good quality agricultural land and 1.8 (ha) (82% north) Grade 3 agricultural land, a negative effect. Only 11% of land within the district is grade 2. Given the loss of Grade 2 & 3 agricultural land and loss of greenfield land, an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 40 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	The village has a local convenience store with a small shop/post office and a surgery and a school has recently relocated to the edge of the village, a slight positive effect. Other services/facilities requiring travel. The village is served by a regular bus service (Crediton/Tiverton) limited to between 1 and 4 journeys per day. Given the provision of services and facilities, an overall slight positive effect is considered.	+1
I) Delivering the necessary infrastructure	The local highway network of narrow roads have restrictive alignments, an adequate access is achievable as the site is accessible from the road, though some of the hedge would need to be removed for visibility. There are no pavements or cycle paths and the road is not adequate to provide pavements. There is a network of public footpaths which border the site to the east. The primary school was recently rebuilt and is forecast to have some spare capacity to support low levels of development. School will be difficult to expand due to site constraints. Given the sites accessibility, school capacity but lack of pavements an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years),	Within the short term, construction traffic associated with the development will contribute

Medium (6-15 years) Long (15+ years)	towards traffic congestion within Cheriton Fitzpaine. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Cheriton Fitzpaine.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Protection of listed buildings.

Land adjacent the primary school, Cheriton Fitzpaine

Option

Land with a gross site area of 1.1 (ha) at Land adjacent the primary school, Cheriton Fitzpaine is proposed for 35 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. It is typified by a gently rolling and strongly undulating landscape which is intensively farmed. Development on this site for housing would impact on the open, rolling landscape character of the immediate area, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land, which is considered to be negative impact on resource use. Site is located on Grade 3 good / moderate agricultural land, a slight negative effect, given the size of the site. Given the loss of Grade 3 quality agricultural land and loss of greenfield land, an overall slight negative effect is considered.	-1
E) Promoting economic growth	No impact.	0

and employment		
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 35 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	The village has a local convenience store with a small shop/post office and a surgery and a school has recently relocated to the edge of the village, a slight positive effect. Other services/facilities requiring travel. The village is served by a regular bus service (Crediton/Tiverton) limited to between 1 and 4 journeys per day. Given the provision of services and facilities, an overall slight positive effect is considered.	+1
I) Delivering the necessary infrastructure	The local highway network of narrow roads have restrictive alignments, an adequate access is achievable as the site is accessible from the road, though some of the hedge / Devon bank would need to be removed for visibility. There are no pavements or cycle paths. Given the sites accessibility but lack footpaths an overall neutral effect is considered. The site could be compatible with existing uses, although the close position of the school and adjoining playing field would require careful attention to design/layout considerations. The site would form a significant eastward expansion of the village, on this side, considerably extending its built linear form. The site would accommodate up to 30 dwellings per hectare, based on existing housing densities in the area, although this may need to be reduced to provide suitable separation distances e.g. between school site and any new housing. The primary school was recently rebuilt and is forecast to have some spare capacity to support low levels of development. School will be difficult to expand due to site constraints. Given the sites accessibility, school capacity but lack footpaths an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Cheriton Fitzpaine. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Cheriton Fitzpaine.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land off Barnshill, Cheriton Fitzpaine

Option

Land with a gross site area of 0.3 (ha) at Land off Barnshill, Cheriton Fitzpaine is proposed for 12 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site lies within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and undulating landscape which is intensively farmed. The proposed use of the site will have very limited impact on the general landscape of the area given its position, and the fact that it is already surrounded effectively on three sides by development, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	There are a number of listed buildings within reasonable distance of the site, though none would be impacted by development of this site, a neutral effect. The site lies just outside the designated conservation area and forms a significant location in terms of the entry to the more historic core of the village, a slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. Site is located on Grade 3 good / moderate agricultural land, a slight negative effect as the size of the site is relatively small. Given the loss of Grade 3 quality agricultural land and loss of greenfield land, an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 12 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	The village has a local convenience store with a small shop/post office and a surgery and a school has recently relocated to the edge of the village, a slight positive effect. Other services/facilities requiring travel. The village is served by a regular bus service (Crediton/Tiverton) limited to between 1 and 4 journeys per day. Given the provision of services and facilities, an overall slight positive effect is considered.	+1
I) Delivering the necessary infrastructure	The local highway network of narrow roads have restrictive alignments and an adequate access is achievable, a slight positive effect. The site would be extremely compatible with adjacent existing (mainly residential) uses. There is a mix of densities in the area, though a continuation of the larger executive-style housing within Barnshill Close at around 12-15 per hectare is probably more suited to this site. The primary school was recently rebuilt and is forecast to have some spare capacity to support low levels of	+1

	development. School will be difficult to expand due to site constraints. Given the site access is achievable and spare capacity of the school to support low levels of development an overall slight positive effect is considered.	

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Cheriton Fitzpaine. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Cheriton Fitzpaine.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Landboat Farm, Cheriton Fitzpaine

Option

Land with a gross site area of 1.91 (ha) at Landboat Farm, Cheriton Fitzpaine is proposed for 55 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are several mature trees, mainly horse chestnuts, within the site. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site is classed as being within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is defined as being predominantly open, rolling countryside (and further characterised by a tightly rolling, medium to small scale landform). The proposed use of the site will impact on the general landscape of the area given its position; part of the site affords open views eastwards towards the Raddon Hills and rolling, open countryside, while the rest of site would not impact the landscape due to the close proximity to the settlement and existing uses, overall a negative effect.	-2
B) Protection and promotion of a quality built and historic environment	There are no listed buildings although there are some undesignated older (C19) farm buildings sited within the site and which may be worthy of retention as local heritage assets, although it is likely that these buildings do not have significant historical or architectural value. They are typical of the local vernacular but do not presently form an integral part of the local building fabric, having been mainly obscured over the years by various agricultural additions, a neutral effect.	0

C) Mitigating the effects of climate change	A stream runs through the centre of the southern part of the site. 0.4 (ha) of the site is within flood zone 2 and 3 (17%) with the remaining (83%) in flood zone 1. Given the potential flooding issues a negative effect is considered. The site could contribute to surface water run off without appropriate mitigation measures, a further slight negative effect.	-2
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. Site is located on Grade 3 good / moderate agricultural land with some of the site forming agricultural buildings, a negative effect. Given the loss of Grade 3 quality agricultural land and loss of greenfield land, an overall negative effect is considered.	-2
E) Promoting economic growth and employment	In the south western part of the site, there is a group of buildings which are modern, open agricultural storage buildings and other storage facilities. Also contained within the site are a group of three traditional stone barns which link together to form a central yard. Development of the site would result in the loss of some employment uses, a slight negative effect.	-1
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 55 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	The village has a local convenience store with a small shop/post office and a surgery and a school has recently relocated to the edge of the village, a slight positive effect. Other services/facilities requiring travel. The village is served by a bus service (Crediton/Tiverton) limited to between 1 and 4 journeys per day. Some of the land (the strip to the south of Cherry Meadow) already forms some form of informal recreational use with at least one resident having an opening from private gardens onto this land. It would have the potential to be retained as public open space in any wider, more comprehensive, development of sites the whole of the submission. Under previous planning policy this piece of land was designated as 'Important land for sport and recreation'. Given the provision of services and facilities but potential loss of some important recreational land, an overall neutral effect is considered.	0
I) Delivering the necessary infrastructure	Access into the site is via a farm track, formed within the past 10 years located approx. mid way along its northern boundary and with a large visibility splay with the Class lll road, and has new Devon banks either side; this access has replaced the original farm access road along the western edge, which has been partially blocked at its egress onto the Class lll road to only now allow for direct pedestrian access on this side. The local highway network of narrow roads have restrictive alignments and the existing access has inadequate visibility however an adequate access is considered achievable, an overall neutral effect. The primary school was recently rebuilt and is forecast to have some spare capacity to support low levels of development. School will be difficult to expand due to site constraints. Given the site access is achievable but lack of school capacity an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Cheriton Fitzpaine. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Cheriton Fitzpaine.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Colebrooke Glebe, Colebrooke

Option

Land with a gross site area of 1 (ha) at Colebrooke Glebe, Colebrooke is proposed for 15 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area which is typified by being an open, low lying flat landscape and is agriculturally prosperous. The proposed use of the site for housing will have some impact on the landscape character of the area and will be seen in the wider context of the landscape, a negative effect. In particular the site has distant views to the ridge line in the south east which would be affecting by developing this site, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	The site lies adjacent to the Colebrooke Conservation Area. There is likely to be some impact on historic built form as the properties will be close to historic buildings, a slight negative effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent Conservation Area.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 0.94 ha (94% northern portion) of the site is located on Grade 2 very good quality agricultural land and 0.06ha (6% southern portion) is located on Grade 3, good / moderate quality agricultural land, a negative effect. Only 11% of land within the district is grade 2. Given the loss of very good quality and some good / moderate quality agricultural land and greenfield land, an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting	No impact.	0

retail		
G) Meeting housing needs	Option provides for 15 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Colebrooke has no facilities within the village leading to the need to travel for which the village has access to a less than a daily bus service, a negative effect.	-2
I) Delivering the necessary infrastructure	The surrounding highway infrastructure consists of narrow lanes that are considered unsuitable to accommodate significant additional traffic, a negative effect. An adequate site access is considered achievable but would require the loss of an expanse of hedging to create the required visibility onto the highway. There are no education facilities in Colebrooke and therefore development will place additional pressure on home to school transport budget. There is limited capacity to support development. Given the site access is achievable but additional pressure on school transport an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	No anticipated impact.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Colebrooke. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Colebrooke.

Summary of Recommendations

1. 35% affordable housing
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Old abattoir site, Copplestone

Option

Land with a gross site area of 1.5 (ha) at Old abattoir, Copplestone is proposed for 48 dwellings.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	There are a number of mature trees along the northern boundary of the site. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is not visible from far away and the site itself had little merit in its current condition. Landscape impact is likely to	0

	be minimal, a neutral effect.	
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on brownfield land, a positive effect. The land is a former abattoir and is classed as contaminated land which would require remediation. A negative effect. Given the site is located on brownfield land but that it is a contaminated site, an overall slight positive effect is considered.	+1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 48 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	There is an existing pedestrian pavement linking the site to the local highway network, a slight positive effect. The local services are limited requiring travel to facilities although a frequent bus service operates on the A377 and Copplestone rail station is within walking distance, an overall neutral effect.	0
I) Delivering the necessary infrastructure	An adequate access is achievable from the existing access from Shambles Drive, a slight positive effect. A gas main runs through part of the site a potential constraint to delivery, a slight negative effect. Copplestone Primary is a popular and successful school and has been expanded over the years to support previous development. There is very limited capacity to support additional development and school cannot be easily expanded, a slight negative effect. Given an adequate access is achievable but potential issues around a gas main on site and education capacity, an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Copplestone. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Copplestone.

Summary of Recommendations

1. 35% affordable housing
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Remediation of contaminated land.

Land adjacent Dulings Meadow, Copplestone

Option

Land with a gross site area of 4.9 (ha) at Land adjacent Dulings Meadow, Copplestone is proposed for 118 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. Due to the land rising to the east and the fact that this is a large site, there may be a large impact on the surrounding land from far away, a negative effect. The loss of any of the mature trees on the site would also be damaging, a further negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	4.9ha (92%) of the site is located in flood zone 1 the lowest level of flood risk and 0.4ha (8%) is located in Flood zone 2 and 3, a slight negative effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use.. The site is located on Grade 2 very good quality agricultural land, a significant negative effect. Only 11% of land within the district is grade 2. Given the loss of very good quality agricultural land and greenfield land, a significant negative effect is considered.	-3
E) Promoting economic growth and employment	Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site.	+2
F) Supporting retail	No impact.	0

G) Meeting housing needs	Option provides for 118 new dwellings a contribution towards future housing need, a significant positive effect. This level of housing provision could be out of scale with the settlement size of Copplestone and may need to be reduced to reflect the housing demand and need within the village.	+3
H) Ensuring community health and wellbeing	There is an existing pedestrian pavement linking the site to the local highway network, a slight positive effect.The local services are limited requiring travel to facilities although a frequent bus service operates on the A377 and Copplestone rail station is within walking distance, an overall neutral effect.	0
I) Delivering the necessary infrastructure	Access from Bewsley Hill is feasible but not favoured as it is narrow and lacks footways near its junction with the A377 an alternative access direct from the A377 is also feasible but would require the re-alignment of Elston Lane, a slight negative effect. Copplestone Primary is a popular and successful school and has been expanded over the years to support previous development. There is very limited capacity to support additional development and school cannot be easily expanded. Given an access realignment is achievable but there are issues around education capacity, an overall slight positive effect is considered.	+1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Copplestone. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Copplestone.

Summary of Recommendations

1. 35% affordable housing
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Bewsley Farm, Copplestone

Option

Land with a gross site area of 9.7 (ha) at Bewsley Farm, Copplestone is proposed for 50 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is adjacent to the north of the village of Copplestone and is comprised of a large area of farmland rising away from the existing houses, with hedgerows and mature trees around the site. This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. Due to the rising nature of the ground and the number of mature trees around the site, development could	-1

	have impacts on distant views and the landscape, a slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	A stream runs along the western boundary and therefore a flood risk assessment may be required. The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and greenfield land, a negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 50 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	There is an existing pedestrian pavement linking the site to the local highway network, a slight positive effect. The local services are limited requiring travel to facilities although a frequent bus service operates on the A377 and Copplestone rail station is within walking distance, an overall neutral effect.	0
I) Delivering the necessary infrastructure	There is a possible access from Bassett's Close (via an adjacent site) and Sunnymead, but it is not known whether third party land would be required however both Bassett's Close and Sunnymead are estate roads which have a limited capacity for additional traffic. Given it is not known if third party land is required to access the site an uncertain effect is considered. Two points of access can be achieved with an access road serving up to 50 dwellings but limiting factor would be capacity of junction onto A377 from Sunnymead. Assessment would be required to justify development up to 50. Copplestone Primary is a popular and successful school and has been expanded over the years to support previous development. There is very limited capacity to support additional development and school cannot be easily expanded. Given an access is unknown and education capacity, an overall uncertain effect is considered.	?

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years),	Within the short term, construction traffic associated with the development will contribute

Medium (6-15 years) Long (15+ years)	towards traffic congestion within Copplestone. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Copplestone.

Summary of Recommendations

1. 35% affordable housing
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Linhay, Culmstock

Option

Land with a gross site area of 0.12 (ha) at Linhey, Culmstock is proposed for 5 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. Land is currently a field. Does not appear to be grazed as recently been mowed. The land is generally flat, and landscape impacts would likely be minimal (particularly given the mitigating presence of the adjacent housing), a positive effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	+2
B) Protection and promotion of a quality built and historic environment	The site is located outside but adjacent the Culmstock Conservation Area, a neutral effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent Conservation Area.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	The site is already partially developed with terraced new builds with the remaining part of the site located on greenfield land, a negative effect. The remaining portion of the site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect as the site is relatively small. Given the loss of good / moderate quality agricultural land and greenfield land, a slight negative effect is considered.	-1
E) Promoting	No impact.	0

economic growth and employment		
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 5 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Culmstock has very limited local services/facilities but is served by a bus route served with 5 or more journeys per day, a slight negative effect.	-1
I) Delivering the necessary infrastructure	The local highway network consists of narrow roads having restrictive alignments. The remainder of the site has good access and a two storey terrace would relate well to the existing dwellings, a positive effect. Highway Adoption Plans would indicate the highway is adopted up to the hedge line, however the hedge has been removed and a fence replaces it there are no demarcation marks on site and would conclude adoption is to Fence line however a scaled measurement from the adoption plan shows a smaller margin than the verge to the fence. Notwithstanding this access would be allowed subject to land ownership confirmations from owner and provision within the design for off road parking as much of the existing verge has been taken up with additional parking for the already built extension. The primary school is forecast to be at capacity and has very limited capacity to expand. Given an adequate access is achievable and potential issues around education capacity, an overall negative effect is considered.	-2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Culmstock. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Culmstock.

Summary of Recommendations

1. Site carried forward as an affordable housing rural exception site.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Design and layout to respect the character and setting of the Conservation Area.
4. Archaeological investigation and appropriate mitigation measures.

Hunters Hill, Culmstock

Option

Land with a gross site area of 1 (ha) at Linhey, Culmstock is proposed for 20 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site lies upon two landscape character areas. To the south west, the landscape character of the site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The north east part of the site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The land is slightly elevated compared to level of houses bordering site to the south. Developing the higher reaches may result in breaking the skyline and dominating the existing residential developments, a negative effect. Containing the settlement within the valley would be preferable. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential with regard to known prehistoric activity in the vicinity as well as evidence of the iron industry that operated in the Blackdown Hills in the Roman and later periods, a negative effect. Any planning application for development here will need to be supported by the results of an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	The site is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect as the site is relatively small. Given the loss of good / moderate quality agricultural land and greenfield land, a slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 20 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Culmstock has very limited local services/facilities but is served by a bus route served with 5 or more journeys per day, a slight negative effect.	-1
I) Delivering the	The local highway network consists of narrow roads having restrictive alignments as such Hunter's Hill would require widening. An	-1

necessary infrastructure	adequate access to the site is achievable but may need improving, this does not appear insurmountable, a slight negative effect. The primary school is forecast to be at capacity but has very limited capacity to expand. Given an adequate access is achievable but may need improving and potential issues around education capacity, an overall slight negative effect is considered.	

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Culmstock. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Culmstock.

Summary of Recommendations

1. Site carried forward as an affordable housing rural exception site.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Culmstock Glebe and Rackfields, Culmstock Option

Land with a gross site area of 1. (ha) at Culmstock Glebe and Rackfields, Culmstock is proposed for 25 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is large and open, and generally flat, and would be visible from afar, resulting in landscape impacts, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	The site lies in an area of archaeological potential with regard to known prehistoric activity in the vicinity as well as evidence of the iron industry that operated in the Blackdown Hills in the Roman and later periods, a slight negative effect. There is potential for some impact on the setting of the church. Any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it. The site is adjacent to a Conservation Area and although land is raised, new dwellings are not likely to	-1

	be visible from village as the site is screened from the North.0.03ha within Culmstock Conservation Area. The Conservation Area and a number of listed buildings however lie to the north. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent Conservation Area and listed buildings. Given the potential for impact on an area of historic interest, conservation area and listed buildings but mitigation measures available, a slight negative effect is considered.	
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest risk of flooding, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	0
D) Safeguarding and minimising resource use	The site is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect, as the site is relatively small. Given the loss of good / moderate quality agricultural land and greenfield land, a slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 25 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Culmstock has very limited local services/facilities but is served by a bus route served with 5 or more journeys per day, a slight negative effect.	-1
I) Delivering the necessary infrastructure	The local highway network consists of narrow roads having restrictive alignments and there is poor access via a steep winding road which is a key route into village. The C391 is unsuitable to provide access due to inadequate visibility with its junction to Uffculme Road, although an adequate access is achievable direct from Uffculme Road, a negative effect. The primary school is forecast to be at capacity but has very limited capacity to expand. Given an adequate access is achievable from Uffculm Road but there are potential issues around education capacity, an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Culmstock. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Culmstock.

Summary of Recommendations

1. 35% affordable housing
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.
4. Protection of listed buildings.

Land at Blundells Road, Halberton

Option

Land with a gross site area of 1.25 (ha) at Land at Blundells Road, Halberton is proposed for 25 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site can be viewed from the south, east and north ridgelines, and would therefore have a large impact on the surrounding landscape, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	The site is located within the Halberton Conservation Area and there is a group of listed buildings located to the east of the site. This site lies in an area of archaeological potential with the HER recording prehistoric activity here and recent archaeological work to the west has identified prehistoric activity across the wider landscape, a negative effect. Any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it. Given the potential impact on the Conservation Area, listed buildings, an area of archaeological potential an overall negative effect is considered.	-2
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed, a negative effect. The site is located on Grade 1 excellent quality agricultural land and a small portion of Grade 3 good / moderate quality agricultural land, a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of Grade 1 excellent quality agricultural land, some grade 3 and greenfield land, a significant negative effect is considered.	-3
E) Promoting economic growth and employment	No impact.	0
F) Supporting	No impact.	0

retail		
G) Meeting housing needs	Option provides for 25 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Halberton is remote from most services and facilities but is located on a bus route with hourly or greater service, a slight negative effect.	-1
I) Delivering the necessary infrastructure	The C769 east through Halberton is, due to narrow carriageway width's and lack of pedestrian facilities, unsuitable to cater for significant traffic generation. An access direct onto Lower Town road is achievable, a neutral effect. Access to the east at Lower town can be achieved with some road improvements and would serve a development of up to 25 dwellings from a share surface road and potentially greater, however concerns still remain over the capacity of the priority system and a full capacity study should be undertaken to prove additional traffic is acceptable. The primary school is forecast to have some limited spare capacity to support development but cannot be easily expanded due to its restricted site. Given that an adequate access is achievable and education capacity, an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Halberton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Halberton.

Summary of Recommendations

1. 35% affordable housing
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Land South West of Conigar Close, Hemyock

Option

Land with a gross site area of 1.1 (ha) at Land South West, Hemyock is proposed for 35 dwellings.

Sustainability objective	**Commentary**	**Impact**

A) Protection of the natural environment	The site is located within the Blackdown Hills Area of Outstanding Natural Beauty (AONB), a slight negative effect. This sites falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. There are views into and from the site from ridges to the north and south, a negative effect. There would be some landscape impact, but a high degree of mitigation would be provided by the adjacent housing to the north and east an overall slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	Recent archaeological work at the northern end of this site has revealed the presence of an, as yet, undated, iron working area. It is known that this industry was operation from at least the Roman period through to the medieval period, a negative effect. Any proposal for development of the land to the south of those areas already investigated will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed, a negative effect. There is a historic quarry to south west corner/edge of site considered contaminated land. The site is located on Grade 3 good /moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land, greenfield land and presence of contaminated land a negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 35 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Hemyock services include; shops, a village school, sports facilities / open space, post office, public house, church and medical facility, a positive effect. The site is a short walk from Hemyock village centre and its public transport connections served by a bus route having 5 journeys per day or more.	+1
I) Delivering the necessary infrastructure	The local highway network consists largely of narrow roads having restrictive alignments. The north section of this site is currently being developed while access to the south section through Conigar Close and Logan Way a residential estate could be achievable, a slight positive effect. The primary school is expected to have limited surplus capacity to support future housing development with limited options for expansion. Given that an adequate access is achievable but with potential issues around education capacity, an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.

	Cumulatively development may impact on the setting and character of the Blackdown hills Area of Outstanding Natural Beauty.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Hemyock. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Hemyock.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.
4. Contaminated land.
5. High quality design reflecting the character and setting of the Blackdown Hills AONB.

Culmbridge Farm, Hemyock

Option

Land with a gross site area of 6.1 (ha) at Culmbridge Farm, Hemyock is proposed for 80 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is located within the Blackdown Hills Area of Outstanding Natural Beauty (AONB), a slight negative effect. A number of important trees within the site (Tree Preservation Orders s southern side of site), a negative effect. This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. There are views into the site from south and western ridges, a negative effect. The adjacent housing and farm buildings would provide a level of mitigation, though there are likely to be some landscape impacts. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. Given the sites location in the Blackdowns AONB, potential loss of matures trees and impact on landscape setting an overall negative effect is considered.	-2
B) Protection and promotion of a	The recent discovery of Hemyock's industrial heritage – pottery (17th century) and iron production (Roman to medieval) – raises the potential for development around the village to expose archaeological and artefactual deposits associated with these	-1

quality built and historic environment	industries, a negative effect. Therefore, any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it, an overall slight negative effect.	
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. North eastern corner is previously developed land with farm buildings associated with a poultry farm, a negative effect. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land but use of previously developed land a negative effect is considered.	-2
E) Promoting economic growth and employment	The redevelopment of the north east corner would result in the loss of some farm buildings, a negative effect.	-2
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 80 new dwellings a contribution towards future housing need, a significant positive effect. This level of housing provision could be out of scale with the settlement size of Hemyock and may need to be reduced to reflect the housing demand and need in the vicinity.	+3
H) Ensuring community health and wellbeing	Hemyock services include; shops, a village school, sports facilities / open space, post office, public house, church and medical facility, a positive effect. The site is a short walk from Hemyock village centre and its public transport connections served by a bus route having 5 journeys per day or more.	+1
I) Delivering the necessary infrastructure	Level changes between the road and field mean access is only achievable from the north east corner, a neutral effect. The redevelopment of the north east corner would require the relocation of the existing farm buildings. The local highway network consists largely of narrow roads having restrictive alignments. The primary school is expected to have limited surplus capacity to support future housing development with limited options for expansion. Given that an adequate access is achievable but the potential issues around education capacity, an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure. Cumulatively development may impact on the setting and character of the Blackdown hills Area of Outstanding Natural Beauty.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Hemyock. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Hemyock.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.
4. Relocation of existing farm buildings.
5. High quality design reflecting the character and setting of the Blackdown Hills AONB.

Land north of Culmbridge Farm, Hemyock

Option

Land with a gross site area of 5.2 (ha) at Land north of Culmbridge Farm, Hemyock is proposed for 80 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is located within the Blackdown Hills Area of Outstanding Natural Beauty (AONB), a slight negative effect. 0.5ha of the site (north east corner) is noted to be a Priority Habitat for its grassland. At this stage, the Council is not aware of the presence of protected species. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The majority of the site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area to the south west. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. A small portion of the site in the north east of the site falls within the 'Sparsely settled farmed valley floors' landscape character area. This area is typified by the presence of rivers or streams and related flat or gently sloping valley bottoms within the low lying areas of the district. There are views into and out of the site from ridges to the north, south and west. The site is also elevated, and there would likely be large landscape impacts as a result of developing the whole site, a negative effect. Some mitigation might be provided by the adjacent housing. Particular consideration would need to be given to value of the landscape to the special qualities of the AONB.	-2
B) Protection and promotion of a quality built and historic environment	The recent discovery of Hemyock's industrial heritage – pottery (17th century) and iron production (Roman to medieval) – raises the potential for development around the village to expose archaeological and artefactual deposits associated with these industries, a negative effect. Therefore, any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	5.13ha (99% South West and West) of the site is located in flood zone 1 the lowest level of flood risk with the remaining 0.07ha (1% along North East and East side) located in Flood zone 2. Given the amount of land in flood zone 1 an overall neutral effect is considered. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1

D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 3.3ha (63% South) is located on Grade 3 good / moderate quality agricultural land and 1.9ha (37% North) is located on Grade 4 poor quality agricultural land, a neutral effect. Given the loss of good / moderate quality agricultural land and some poor agricultural land is considered an overall slight negative effect.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 80 new dwellings a contribution towards future housing need, a significant positive effect.	+3
H) Ensuring community health and wellbeing	Hemyock services include; shops, a village school, sports facilities / open space, post office, public house, church and medical facility, a slight positive effect. The site is a short walk from Hemyock village centre and its public transport connections served by a bus route having 5 journeys per day or more.	+1
I) Delivering the necessary infrastructure	An adequate access is achievable, a positive effect. The primary school is expected to have limited surplus capacity to support future housing development with limited options for expansion. Given that an adequate access is achievable and but issues around education capacity, an overall slight positive effect is considered.	+1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure. Cumulatively development may impact on the setting and character of the Blackdown hills Area of Outstanding Natural Beauty.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Hemyock. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Hemyock.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.
4. High quality design reflecting the character and setting of the Blackdown Hills AONB.

Land by Kentisbeare Village Hall, Kentisbeare

Option

Land with a gross site area of 0.8 (ha) at Land by Kentisbeare Village Hall, Kentisbeare is proposed for 26 dwellings & 500 sqm floor space.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is enclosed above the village hall, by existing vegetation and topography would limit the overall impact, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	The site boundary is adjacent with Kentisbeare Conservation Area to the north. There is a potential impact on the setting of the parish church, which can be seen from the road, should any development occur. This site lies on the edge of the historic core of the settlement and any development here has the potential to expose archaeological and artefactual deposits associated with the early settlement here, a negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, an overall slight negative effect.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 0.2ha (25% South) is located on Grade 2 very good quality agricultural land and 0.6ha (75% North) is located on Grade 3 good / moderate quality agricultural land, a neutral effect. Only 11% of land within the district is grade 2. Given the loss of very good / good / moderate quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	Option provides 500 sqm of commercial floorspace helping to diversify the economy and encourage inward investment, a positive effect.	+2
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 26 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Kentisbeare has very limited services/facilities including a village shop and primary school, a slight negative effect. There is a bus service to Honiton and Cullompton, however the service is only once or twice a day. There is a public footpath on the south side of the site which leads to the village centre. The allocation of commercial land within Kentisbeare could decrease air quality within the settlement through increased traffic movement and in particular HGV movements, a slight negative effect. Given the sustainable location for walking but potential for harm to air quality an overall slight negative effect is considered.	-1

I) Delivering the necessary infrastructure	An acceptable access is achievable and there are no issues with the route to the A373, although other local roads are narrow, having restrictive alignments, an overall positive effect. Kentisbeare Primary forecast to have limited spare capacity to support future housing development, the school is on a constrained site and cannot be easily expanded. Given that an adequate access is achievable but potential issues around education capacity, an overall slight positive effect is considered.	+1

Secondary/cumulative/synergistic effects:	No anticipated impact.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Kentisbeare. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Kentisbeare.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Land between the Primary School & the Church, Lapford

Option

Land with a gross site area of 1.3 (ha) at Land between the Primary School & the Church, Lapford is proposed for 42 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium scale fields of permanent pasture. Whilst the site is elevated, so are the adjoining built up uses, a neutral effect. There are wide views to the south, though the uses immediately to the south do screen the site relatively well. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and	The site is located next to a listed church to the west, a slight negative effect. It is not anticipated that the development of this area will have an archaeological impact a neutral effect. Overall a slight negative effect is considered.	-1

historic environment		
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect. Given the loss of good / moderate quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 42 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Lapford has a range of services including a shop, pub, church, village hall, school and petrol station an access to a reasonable bus and rail service, a slight positive effect.	+1
I) Delivering the necessary infrastructure	The capacity of the junction onto Main C480 (north-south road through village from the U606 (road running along southern boundary of site) is questioned, an uncertain effect. Access to the site can be achieved with adequate visibility, a neutral effect. There are concerns over poor alignment gradient lack of footways and additional highway safety risks to pedestrians, in particular school children at the adjacent school. There is a need for additional footway over frontage and link to school, overall a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	No anticipated impact.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Lapford. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Lapford.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land West of Greenaway, Morchard Bishop

Option

Land with a gross site area of 0.3 (ha) at Land west of Greenway, Morchard Bishop is proposed for 12 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by its gently rolling and strongly undulating form and an intensively farmed agricultural area. However, development of this site would have minimal impact on character of landscape as it is bound to the east by existing development which already provides a backdrop of the built environment, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	The site lies in an area of archaeological potential to the south of a possible prehistoric settlement or funerary monument, a negative effect. Any planning application for development here would need to be supported by a programme of archaeological work to allow an understanding of the significance of heritage assets that may be present here, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect. Given the loss of good / moderate quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 12 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Morchard Bishop has a range of services including a pub, shop and sports facility which can be accessed via a quiet road, a slight positive effect.	+1
I) Delivering the necessary infrastructure	There is an existing farm access into the site from the road immediately to the South and a possible further access via the eastern boundary from the Greenway Estate, a positive effect. The Primary school is forecast to have some spare capacity to support development however school cannot be easily expanded. Given that an adequate access is achievable and education capacity, an	+2

	overall positive effect is considered.	

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Morchard Bishop. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Morchard Bishop.

Summary of Recommendations

1. Site carried forward as an affordable housing rural exception site.
2. Archaeological investigation and appropriate mitigation measures.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Tatepath Farm, Morchard Bishop

Option

Land with a gross site area of 0.5 (ha) at Tatepath Farm, Morchard Bishop is proposed for 16 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by a gently rolling and strongly undulating landscape which is intensively farmed. The impact of developing this site would be minimal as there are already a large number of buildings already on the site, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1

change		
D) Safeguarding and minimising resource use	Although the site contains agricultural buildings it is classified as greenfield land, a neutral effect. There is possible land contamination, an uncertain effect.	0/?
E) Promoting economic growth and employment	Development of the site would result in the loss of a number of agricultural units a reduction in rural prosperity, a negative effect.	-2
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 16 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Morchard Bishop has a range of services including a pub, shop and sports facility which can be accessed via a quiet road, a slight positive effect.	+1
I) Delivering the necessary infrastructure	An adequate access is achievable, a neutral effect. The Primary school is forecast to have some spare capacity to support development however school cannot be easily expanded. Given that an adequate access is achievable and education capacity, an overall positive effect is considered.	+2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Morchard Bishop. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Morchard Bishop.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Church Street, Morchard Bishop

Option

Land with a gross site area of 2.6 (ha) at Church Street, Morchard Bishop is proposed for 25 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The middle of the site features an old established tree which may be worthy of a Tree Preservation Order. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by a gently rolling and strongly undulating landform which is intensively farmed. The site provides views to the wider countryside to the east which would be lost if the site was developed, as the site is relatively small a slight negative effect is considered.	-1
B) Protection and promotion of a quality built and historic environment	Whilst the site falls outside of the Conservation Area any development on this site would impact upon existing development directly to the south and west, which falls within the Conservation Area. There are a large number of listed buildings immediately adjacent to the site on the road to the south. The site lies on the edge of the historic core of the village and to the south of the site of the former vicarage and there is evidence of prehistoric activity in the wider landscape, a slight negative effect. Any planning application for development here would need to be supported by a programme of archaeological work to allow an understanding of the significance of heritage assets that may be present here, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect as the site is relatively small. Given the loss of good / moderate quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 25 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Morchard Bishop has a range of services including a pub, shop and sports facility which can be accessed via a quiet road, a slight positive effect. A public footpath bisects the site.	+1
I) Delivering the necessary infrastructure	The eastern part of the site is potentially compatible although the access and relationship with development on Church Street and Old Rectory Gardens may be problematic. Access is achievable from Rectory Gardens, but third party land may be required, an uncertain effect. Access from Old Rectory Gardens would serve 25 dwellings with pedestrian link to Church St is achievable. The Primary school is forecast to have some spare capacity to support development however school cannot be easily expanded. Given that an adequate access is achievable but third party land may be required and the potential impact on the education capacity, an overall uncertain effect is considered.	?

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Morchard Bishop. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Morchard Bishop.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Court Orchard, Newton St Cyres

Option

Land with a gross site area of 1 (ha) at Court Orchard, Newton St Cyres is proposed for 32 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area, which is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The landscape to the north of the site opens out and is relatively flat, with views that are not distant from the site, it being largely screened by the existing field boundaries, a neutral effect. The adjacent housing would provide some level of mitigation from developing the site for additional dwellings. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential with the Historic Environment Record showing a concentration of prehistoric archaeological sites, a slight negative effect. The site also contains the remnants of an extensive water meadow system. Any proposal for development here should be supported by the results of an appropriate programme of archaeological work to allow the significance of the heritage assets affected to be determined and appropriate mitigation implemented, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	1ha (66% of the site, to the west) of the site is located in Flood zone 1 with the remaining 0.5ha (33% eastern portion) located in Flood zones 2 and 3, a slight negative effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1

D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 very good quality agricultural land, a negative effect. Only 11% of land within the district is grade 2. Given the loss of very good quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 32 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Newton St Cyres has very limited range of services, a slight negative effect. There is a footpath linking the site to the A377 which carries regular bus services and the rail station is within walking distance.	-1
I) Delivering the necessary infrastructure	The site has sufficient highway frontage to enable the provision of an adequate access however the narrow carriageway approaching the A377 would be likely to restrict traffic generation to avoid congestion, a slight negative effect. The Primary school is forecast to have some spare capacity to support development however school cannot be easily expanded. Given that an adequate access is achievable and issues around education capacity, an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Newton St Cyres. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Newton St Cyres.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Land west of Tytheing Close, Newton St Cyres
Option

Land with a gross site area of 2 (ha) at Land west of Tytheing Close, Newton St Cyres is proposed for 48 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There is a very small wooded area on the south eastern portion of the site which could potential be a habitat for various types of biodiversity. There are previous records of badger sightings within the site. At this stage, the Council is not aware of the presence of other protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site is located in the 'Lower rolling farmed and settled valley slopes' landscape character area. It is characterised by a gently rolling and undulating landscape with light soils which are intensively farmed. The site is very open in character and offers very wide views to the lower valley floor and ridges to the north and west, a negative effect. The proximity of the Tytheing Close housing to the east may provide a level of mitigation against any impact on the landscape from developing the site, particularly if development is focused within the south eastern edge.	-2
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential with the Historic Environment Record showing a concentration of prehistoric archaeological sites, a slight negative effect. Any proposal for development here should be supported by the results of an appropriate programme of archaeological work to allow the significance of the heritage assets affected to be determined and appropriate mitigation implemented, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 very good quality agricultural land, a negative effect. Only 11% of land within the district is grade 2. Given the loss of very good quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 48 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Newton St Cyres has very limited range of services, a slight negative effect. There is a footway on the south side only of the A377 which carries regular bus services and the rail station is within walking distance.	-1
I) Delivering the necessary infrastructure	The site is considerably elevated above the adjacent A377 and therefore for reasons of access, the land requirement would be likely to severely restrict the development potential of the site, a slight negative effect. The Primary school is forecast to have some spare capacity to support development however school cannot be easily expanded. Given that an adequate access is difficult to achieve and education capacity, an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Newton St Cyres. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Newton St Cyres.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Land east of Tytheing Close, Newton St Cyres

Option

Land with a gross site area of 2 (ha) at Land west of Tytheing Close, Newton St Cyres is proposed for 64 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is located in the 'Lower rolling farmed and settled valley slopes' landscape character area. It is characterised by a gently rolling and undulating landscape with light soils which are intensively farmed. The site is very open in character and offers very wide views to the lower valley floor and ridges to the north and east, a negative effect. The proximity of the Tytheing Close housing to the east may provide a level of mitigation against any impact on the landscape from developing the site, particularly if development is focused along the western edge of the site. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential with the Historic Environment Record showing a concentration of prehistoric archaeological sites. The field to the south contains two substantial prehistoric or Romano-British enclosures, a slight negative effect. Any proposal for development here should be supported by the results of an appropriate programme of archaeological work to allow the significance of the heritage assets affected to be determined and appropriate mitigation implemented, an overall slight negative effect.	-1
C) Mitigating the effects of climate	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1

change		
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 very good quality agricultural land, a negative effect. Only 11% of land within the district is grade 2. Given the loss of very good quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 64 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Newton St Cyres has very limited range of services, a slight negative effect. There is a footway on the south side only of the A377 which carries regular bus services and the rail station is within walking distance.	-1
I) Delivering the necessary infrastructure	The site has sufficient frontage to enable adequate visibility splays to be provided, a positive effect. The Primary school is forecast to have some spare capacity to support development however school cannot be easily expanded. Given that an adequate access is achievable and education capacity, an overall positive effect is considered.	+2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Newton St Cyres. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Newton St Cyres.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Land at Oakford, Oakford
Option

Land with a gross site area of 0.5 (ha) at Land west of Land at Oakford, Oakford is proposed for 5 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The impact of development on this site would be low, due to the screening provided by the hedgerow and trees, a neutral effect. Development on the site would only be visible from three dwellings, two to the west and one to the south. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	The site is located within the Oakford Conservation Area, a slight negative effect. This site lies on the edge of the historic core of Oakford and any development here has the potential to expose archaeological deposits associated with the early settlement here, a slight negative effect. Archaeological mitigation may be required through the application of an appropriately worded condition to any consent granted for development here, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect as the site is relatively small. Given the loss of good / moderate quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 5 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Oakford is remote from all services/facilities with the nearest town Bampton located some 5.5 km distance away and on a less than a daily bus service, a negative effect.	-2
I) Delivering the necessary infrastructure	The local highway network consists of narrow roads having restrictive alignments, a negative effect. A single, central access would be required in order to achieve adequate visibility however the field is considerably higher than the road and this would cause problems in obtaining access, a negative effect. No immediate local school, development will increase the home to school transport costs as no schools are within a safe walking distance. Area is served by Bampton School. Given that an adequate access is difficult to achieve and poor education capacity, an overall negative effect is considered.	-2

Secondary/cumulative/synergistic effects:	No anticipated impact.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Oakford. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Oakford.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Higher Town, Sampford Peverell

Option

Land with a gross site area of 6 (ha) at Higher Town, Sampford Peverell is proposed for 60 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The overall rise above Turnpike is significant and there are far-reaching views to and from the site. If suitable access could be achieved, given the steep gradients, it is likely that a substantial length of hedgerow would need to be removed. Visually the character of the area is agricultural and divorced from the village, with only a few low density detached dwellings on the opposite side of Turnpike. Development would have a significant landscape impact, a significant negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-3
B) Protection and promotion of a quality built and historic environment	The site is adjacent to Sampford Peverell Conservation Area to North East. The site occupies an area enclosed in the medieval period and archaeological remains associated with the earlier field system and archaeological remnants may be affected by development here, a slight negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, an overall slight negative effect.	-1
C) Mitigating the	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off	-1

effects of climate change	without appropriate mitigation measures, a slight negative effect.	
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 very good quality agricultural land, a negative effect. Only 11% of land within the district is grade 2. Given the loss of very good quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 60 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Sampford Peverell remote from some services/facilities but has; a shop with post office, pubs, primary school, play area, sports facilities, Doctors' surgery, village hall and mobile library, a slight positive effect. Sampford Peverell is located on a bus route with hourly or greater service and Tiverton Parkway rail station is 2.1 km distant.	+1
I) Delivering the necessary infrastructure	The roads surrounding the site have no footpaths and the Turnpike is a dangerous road for pedestrians. Within the village, pedestrian and cycle links are good, with access to the Grand Western Canal and the cycle path connecting the train station to Tiverton and Willand. Access onto Turnpike would require substantial hedgerow and earth removal and the topography of the site may make suitable access unachievable, a slight negative effect. Adequate road access is achievable to the site however access from the minor roads would require frontage improvements including the removal of substantial length of hedgerow to ensure visibility displays, a slight negative effect. The primary school is on a constrained site but is forecast to have some limited spare capacity to support future housing development however has very limited capacity to expand. Given the difficulties identified to access to the site and potential issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Sampford Peverell. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Sampford Peverell.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

3. Archaeological investigation and appropriate mitigation measures.

Land off Whitnage Road, Sampford Peverell

Option

Land with a gross site area of 6 (ha) at Land off Whitnage Road, Sampford Peverell is proposed for 60 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The canal is a conservation area and County Wildlife Site, negative effect. At this stage, the Council is not aware of the presence of protected species. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The eastern part of the site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The western part of the site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. All parts of the site are well enclosed in the landscape, with no far-reaching views, a neutral effect. The eastern part of the site is particularly low-lying as it leads down to the stream and canal. Housing development east of Whitnage Road would have an adverse impact on the character of the rural landscape which is clearly divorced from the existing settlement, overall a slight negative effect.	-1
B) Protection and promotion of a quality built and historic environment	The Grand Western Canal runs along some of the north side of the site. The site lies in an area where prehistoric activity is demonstrated by findspots of stone tools, a slight negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	A stream follows the boundary of the fields within the site and a flood risk assessment may be required to determine any potential impact. The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. There is a 0.2 ha (3% middle of east field) classified as contaminated land due to quarring, a negative effect. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 60 new dwellings a contribution towards future housing need, a positive effect.	+2

H) Ensuring community health and wellbeing	Sampford Peverell remote from services/facilities but has; a shop with post office, pubs, primary school, play area, sports facilities, Doctors' surgery, village hall and mobile library, a slight positive effect. Sampford Peverell is located on a bus route with hourly or greater service and Tiverton Parkway rail station is 1.7 km distant. The site is located adjacent to the A361 and could be subject to traffic noise, a slight negative effect. Overall a neutral effect is considered.	0
I) Delivering the necessary infrastructure	Adequate road access is achievable but Whitnage Road would require widening over the site frontages, a slight negative effect. Within the village, pedestrian and cycle links are good, with access to the Grand Western Canal and the cycle path connecting the train station to Tiverton and Willand, a slight positive effect. The primary school is on a constrained site but is forecast to have some limited spare capacity to support future housing development however has very limited capacity to expand. Given an adequate site access is achievable but there are potential issues around education capacity an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Sampford Peverell. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Sampford Peverell.

Summary of Recommendations

1. 35% affordable housing.
2. Noise mitigation measures.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
4. Archaeological investigation and appropriate mitigation measures.
5. Remediation of contaminated land.

Land at Mountain Oak Farm, Sampford Peverell

Option

Land with a gross site area of 9 (ha) at Land at Mountain Oak Farm, Sampford Peverell is proposed for 216 dwellings.

Sustainability objective	**Commentary**	**Impact**
A) Protection of	Site runs up to edge of Grand Western Canal Country Park and Local Nature Reserve, a negative effect. At this stage, the Council is	-2

the natural environment	not aware of the presence of protected species. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. Significant impact on the Canal Conservation Area would be caused if development came right up to the northern boundary of the site, a negative effect. Development of a smaller portion of the land would have less of an impact and be closer related to existing housing, though even these dwellings are visually separated from the main settlement.	
B) Protection and promotion of a quality built and historic environment	This site occupies a substantial area in a landscape where prehistoric activity is recorded in the wider landscape, a slight negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, a neutral effect. Development would impact upon the Canal Conservation Area if the whole site was developed, a negative effect. Any future development would need to consider the mitigation measures available to reduce the impact of development on this Conservation Area.	-2
C) Mitigating the effects of climate change	The site contains a pond and streams which follow the field boundaries within the site, and a flood risk assessment may be required to determine any potential impact. The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. There is a 0.9 ha classified as contaminated land due to quarrying, a negative effect. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land, potential issues around contaminated land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 216 new dwellings a contribution towards future housing need, a significant positive effect. This level of housing provision could be out of scale with the settlement size of Sampford Peverell and may need to be reduced to reflect the housing demand and need within the village.	+3
H) Ensuring community health and wellbeing	Sampford Peverell remote from services/facilities but has; a shop with post office, pubs, primary school, play area, sports facilities, Doctors' surgery, village hall and mobile library, a slight positive effect. Sampford Peverell is located on a bus route with hourly or greater service and Tiverton Parkway rail station is 1 km distant.	+1
I) Delivering the necessary infrastructure	The site could be accessed from Lower Town to the north of the link to the station, as the verge is again maintained in the verge schedules but not shown on Land charges plans, the existing access is suitable for a share surfaced cul-de-sac serving a maximum of 25 dwellings. The overall yield figure will be based upon what access can be formed to the east and a secondary access provided further to the west and an emergency access through the existing access. The site access is of limited width but would be acceptable as a shared surface serving a limited development, a neutral effect. Visibility at the site access is inadequate for a 40 mph speed limit but the 30 mph limit would need to be extended. Street lighting would need to be provided on the C105. There are good links to Tiverton, the outlying villages, the train station and the canal, with a public footpath adjacent to the site, running along Grand Western Canal. The primary school is on a constrained site but is forecast to have some limited spare capacity to support future housing development however has very limited capacity to expand. Given an adequate site access is achievable but	-1

	there are potential issues around education capacity an overall minor negative effect is considered.	

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Sampford Peverell. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Sampford Peverell.

Summary of Recommendations

1. 35% affordable housing.
2. Consideration of the setting of the Grand Western Canal Conservation Area and Local Nature Reserve site.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
4. Archaeological investigation and appropriate mitigation measures.
5. Remediation of contaminated land.

Morrells Farm, Sampford Peverell

Option

Land with a gross site area of 30.9 (ha) at Morrells Farm, Sampford Peverell is proposed for a use of either 742 dwellings, 64,890 sqm commercial floor space or a mixed (and hence proportionately reduced) use of both.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is not elevated or particularly prominent, but development of this large area outside of the village would significantly change the character of Sampford Peverell and its wider environment, a negative effect. As the site is so large, a wider landscape assessment would be needed if taken forward, as the landscape impact would vary across the site. At this	-2

	stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	This site occupies a substantial area in a landscape where prehistoric activity is recorded in the wider landscape, a slight negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, an overall slight negative effect. Final design decisions may need to be determined by a masterplanning process or site development brief. The separation of the site from the main element of the village raises concerns about how well the final design could integrate the existing and the proposed development.	-2
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect although there are substantial flood plains to the east and south. The site could contribute to surface water run off without appropriate mitigation measures, a negative effect.	-2
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on mainly Grade 3 good / moderate & some Grade 4 poor quality agricultural land in the eastern corner. Given the large scale loss of good / moderate / poor quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	Option provides 64,890 sqm of commercial floorspace helping to diversify the economy, provide opportunities for local employees, reduce out-commuting and encourage inward investment, a positive effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact. Even if a lesser amount were allocated, the site still has the potential to meet a significant amount of the district's employment needs.	+3
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 742 new dwellings a contribution towards future housing need, a significant positive effect. This level of housing provision could be out of scale with the settlement size of Sampford Peverell and may need to be reduced to reflect the housing demand and need within the village. It is possible the quantity of housing could be reduced in order to see some commercial development on the site. Even if this is done, this is a large enough site to provide a significant amount of the district's housing needs.	+3
H) Ensuring community health and wellbeing	The site is divorced from the settlement, which could undermine community cohesion, and Sampford Peverell is remote from some services/facilities but has: a shop with post office, pubs, primary school, play area, sports facilities, Doctors' surgery, village hall and mobile library. Sampford Peverell is located on a bus route with hourly or greater service and Tiverton Parkway rail station is less than 0.5km distant. Overall, balancing some positive and negative scores, a neutral outcome has been assumed.	0
I) Delivering the necessary infrastructure	Adequate accesses are achievable. Street lighting on existing roads would be required and the 30 mph speed limit would need to be extended. There is good access where the site is in close proximity to Sampford Peverell, where there is access to the train station, canal and a cycle path, a slight positive effect. The primary school is on a constrained site but is forecast to have some limited spare capacity to support future housing development however has very limited capacity to expand. The site may need to also deliver a large amount of road infrastructure given the possible level of housing, which the final policy will need to address. Given the capacity limitations at the local school, and the level of road infrastructure required, a negative score has been assumed.	-2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Sampford Peverell. A large site like this will take many years to be built out, and is likely to have an impact in the medium to long-term. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Sampford Peverell.

Summary of Recommendations

The final policy would be supplemented by a suite of detailed policies on the issues listed below.

1. Transport provision
2. Environmental protection and green infrastructure
3. Archaeological investigation & protection of listed buildings
4. Provision of Sustainable Urban Drainage (SUD)
5. Community facilities
6. Carbon reduction & air quality
7. Construction impact and the treatment of waste
8. Consideration of road infrastructure
9. Development brief for the site.

Fanny's Lane, Sandford

Option

Land with a gross site area of 1.7 (ha) at Fanny's Lane, Sandford is proposed for 35 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a	0

the natural environment	gently rolling and strongly undulating landscape which is intensively farmed. However, development of this site would have a minimal impact on the character of the landscape as it is contained by development and man-made interventions, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	The western boundary of the site abuts the curtilage of a listed building, a slight negative effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent listed building.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 2 very good quality agricultural land, a negative effect. Given the loss of very good quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 35 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	The site abuts the village hall to the north and a primary school lies close by to the west along Fanny's Lane. There is easy access to the village centre with a public house, church and community shop/post office approximately 200m to the West, a slight positive effect. The closest bus stops lie approximately 150 metres to the north west and 200m to the west in the village centre and there is a school bus service.	+1
I) Delivering the necessary infrastructure	Would need to be accessed off the new road into the estate recently granted planning permission, a slight positive effect. Primary school has capacity to support development in the area but very limited capacity to expand. Given an adequate site access is achievable but there are potential issues around education capacity an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	No anticipated impact.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Sandford. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Sandford.

Summary of Recommendations

1. Part of site carried forward as an affordable housing rural exception site with the remaining area seeking to achieve 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Expansion of village hall car park.

Land off Bowdens Lane, Shillingford

Option

Land with a gross site area of 1.6 (ha) at Land off Bowdens Lane, Shillingford is proposed for 51 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site would be visible from the hill ridge to the west, south and north east, a negative effect. The existing housing would provide some level of mitigation against any landscape impact that would arise. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good /moderate quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting	Option provides for 51 new dwellings a contribution towards future housing need, a positive effect.	+2

housing needs		
H) Ensuring community health and wellbeing	Shillingford is remote from all services/facilities, there is a play area adjacent to the site, which is currently separated from the village and Shillingford has hourly or greater bus service, a negative effect.	-2
I) Delivering the necessary infrastructure	An adequate access is achievable from Bowdens Lane, a slight positive effect. No immediate local school, development will increase the home to school transport costs as no schools are within a safe walking distance. Area is served by Bampton School. Given an adequate site access is achievable but there are issues around education transport an overall slight negative effect is considered	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Shillingford. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Shillingford.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land at Old Butterleigh Road, Silverton

Option

Land with a gross site area of 1.4 (ha) at Land at Old Butterleigh Road is proposed for 45 dwellings.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	This site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The site is shielded to the west and north by high hedges, but may be viewed from the east, a slight negative effect. The site would be visible from the houses adjacent. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and	The site is adjacent to the Silverton Conservation Area, a slight negative effect. Any future proposals would need to consider how	-1

promotion of a quality built and historic environment	best to mitigate the impact of this development on the adjacent Conservation Area.	
C) Mitigating the effects of climate change	A river runs to the eastern side of the site, and a small proportion of the eastern field falls within the flood zones 2 and 3. The remaining area of the site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 1.02ha (54% South) of the site is located on Grade 2 very good quality agricultural land and 0.88ha (46% North) is located on Grade 3 good / moderate agricultural land, a neutral effect. Only 11% of land within the district is grade 2. Given the loss of very good / good /moderate quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 45 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Silverton has a convenience store and butchers while other services / facilities require travel for which Silverton has an hourly bus service, a slight negative effect.	-1
I) Delivering the necessary infrastructure	An adequate access to both sites is achievable however the highway would require widening across the site frontages and frontage footways would need to be provided, a slight negative effect. The primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. The secondary school is at capacity and will need to be expanded to support increased children in and around area, a slight negative effect. Given an adequate site access is achievable and education capacity an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Silverton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Silverton.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Glebe, Silverton

Option

Land with a gross site area of 1.08 (ha) at Glebe, Silverton is proposed for 35 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The site is largely flat, but does offer some views to the south, which will be impacted, although the site will be partly shielded by the hedges and trees, a slight negative effect. Views from the north are limited to the buildings immediately adjacent. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a quality built and historic environment	The proposed development site lies on the edge of the historic core of the village and in an area where the mid-19th century Tithe Map shows a concentration of buildings that have largely disappeared by the late 19th century, a slight negative effect. Archaeological mitigation may be required through the application of an appropriately worded condition to any consent granted for development here, a neutral effect. The site is adjacent to the Silverton Conservation Area, a slight negative effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent Conservation Area.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 0.162 ha (15% South) of the site is located on Grade 1 excellent quality agricultural land, 0.03 ha (3% South) is located on Grade 2 very good quality agricultural land and 0.86 ha (81% north) is located on Grade 3 good / moderate agricultural land , a neutral effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Only 11% of land within the district is grade 2. Given the loss of excellent / very good / good /moderate quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0

G) Meeting housing needs	Option provides for 35 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Silverton has a convenience store and butchers while other services / facilities require travel for which Silverton has an hourly bus service, a slight negative effect.	-1
I) Delivering the necessary infrastructure	An adequate access is achievable from the unclassified road fronting the north west of the site. The unclassified road fronting the north east of the site is subject only to the national speed limit and the provision of adequate visibility would be likely to be problematic, a slight negative effect. The primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. The secondary school is at capacity and will need to be expanded to support increased children in and around area, a slight negative effect. Given an adequate site access is achievable but visibility would be problematic and the potential issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Silverton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Silverton.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

The Garage, Silverton

Option

Land with a gross site area of 0.11 (ha) at The Garage, Silverton is proposed for 5 dwellings.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural	This site falls within the 'River valley slopes and coombes' landscape character area. This area typically falls within the River Exe valley and often has steep, wooded sides and a strong sense of enclosure within a lush valley landscape. The site is shielded by high	0

environment	hedges and trees along the lane, and with few opportunities for views into and out of the site, a neutral effect. It is anticipated that the landscape impact would be minimal. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be undertaken on preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	Site is within Silverton Conservation Area, a slight negative effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent Conservation Area.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	The site is located on brownfield land, a positive effect.	+2
E) Promoting economic growth and employment	Planning permission from 1983 is for storage, parking and maintenance. There will be a loss of employment land if this site is developed for housing, a negative effect.	-2
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 5 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Silverton has a convenience store and butchers while other services / facilities require travel for which Silverton has an hourly bus service, a slight negative effect.	-1
I) Delivering the necessary infrastructure	Access from Newcourt Road where an adequate site access is achievable if located to maximise visibility, a slight positive effect. The primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. The secondary school is at capacity and will need to be expanded to support increased children in and around area, a slight negative effect. Given an adequate site access is achievable but there are potential issues around education capacity an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Silverton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Silverton.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Livinghayes Road, Silverton

Option

Land with a gross site area of 1.04 (ha) at Livinghayes Road, Silverton is proposed for 15 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The site would be highly visible from the hillside immediately east, which is adjacent to the site, a negative effect. The high hedges and trees would reduce the impact of developing the site and provide screening from views in other directions. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect as the site is relatively small. Given the loss of good /moderate quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0

G) Meeting housing needs	Option provides for 15 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Silverton has a convenience store and butchers while other services / facilities require travel for which Silverton has an hourly bus service, a slight negative effect.	-1
I) Delivering the necessary infrastructure	An adequate site access is achievable although the site is located on a private road, Livinghayes Road which is narrow and lacks footways which would need to be provided by any development, a neutral effect. This is only adopted up to house 1, remainder is private road which given the constraints either side is effectively a single carriageway. No more than 15 linear developments with road widening. The primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. The secondary school is at capacity and will need to be expanded to support increased children in and around area, a slight negative effect. Given an adequate site access is achievable but there are potential issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Silverton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Silverton.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

East of Hederman Close, Silverton

Option

Land with a gross site area of 1.86 (ha) at East of Hederman Close, Silverton is proposed for 60 dwellings.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	This site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium scale fields of permanent pasture. The site can be viewed from the wooded hillside to the south west, but it appears an inaccessible viewpoint, a neutral	0

	effect. Views to the north are shielded by elevated fields. The housing along the western boundary is visible from the east and would provide a level of mitigation. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	This site lies within a landscape where there is a concentration of prehistoric activity. While no sites are recorded within the area under consideration it is possible that evidence of prehistoric activity may be present here, a slight negative effect. Should this area be subject to a planning application for development, the Historic Environment Team would advise that any such application should be supported by an appropriate programme of archaeological investigation to allow the presence/absence and significance of archaeological deposits to be understood along with the impact of the development upon them, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The Heal-eye Stream runs along the western boundary of the site, and a flood risk assessment would need to be required to determine any potential impacts of developing the site. The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 0.82ha (south east) is located on Grade 1 Excellent quality agricultural land, 0.04ha (north east) Grade 2 very good quality agricultural land and 1 ha (west) Grade 3 good / moderate quality agricultural land , a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Only 11% of land within the district is grade 2. Given the loss of Excellent / very good /good / moderate quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 60 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Silverton has a convenience store and butchers while other services / facilities require travel for which Silverton has an hourly bus service, a slight negative effect.	-1
I) Delivering the necessary infrastructure	A suitable junction can be formed to the site however there is a need to widen the road C811 (road along northern boundary) at the point of access, a slight positive effect. An adequate footway network back to village centre is also required. The primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. The secondary school is at capacity and will need to be expanded to support increased children in and around area, a slight negative effect. Given an adequate site access is achievable and education capacity an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Silverton. Once completed the development will be

	permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Silverton.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Thorverton Glebe & Paddock, Thorverton

Option

Land with a gross site area of 2.54 (ha) at Thorverton Glebe & Paddock, Thorverton is proposed for 50 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is partially screened by the topography of the land adjacent to the east, known as Peter's Hill. The site has distant views of the site from the west, but this could be limited through the use of screening, a neutral effect. The site itself is fairly level and there would be limited visual impact on the character of Thorverton, an overall neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	This site lies just to the north of a large probably prehistoric enclosure site, a slight negative effect. Any planning application for development here will need to be supported by the results of an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	Part of the site (south eastern) is within Zone 3 Source Protection Zone, a slight negative effect. The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 1 excellent quality agricultural land, a significant negative effect. Grade 1 agricultural land in Mid Devon	-3

resource use	amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of Excellent quality agricultural land and greenfield land an overall significant negative effect is considered.	
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 50 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	The site is close to a number of services, including a primary school, a shop, public house, a bus stop within 100m of the site and a church and Thorverton is on a bus route with five or more bus journeys per day, a slight positive effect.	+1
I) Delivering the necessary infrastructure	The western site has a limited highway frontage to the C23 which at this location is subject only to the national speed limit. An adequate site access cannot therefore be achieved without lowering the speed limit, a slight negative effect. The eastern site can be accessed from both the C23 and School Lane although the latter is not favoured due to the lack of pedestrian facilities. An adequate access from the C23 is achievable if the access is placed at the north end of the site and the C23 would require widening over the site frontage, a slight negative effect. The current accesses into the sites are poor and would need to be improved and would result in the potential loss of hedgerow, a slight negative effect. Would require road widening and footway link to existing to serve site but access can be achieved. Surrounding network is narrow and would limit both sides to shared surface cul-de-sacs of 25 dwellings each subject to the highway improvements and widening. There is no footpath from the site towards Thorverton village centre for 100m so links would need to be provided, a slight negative effect. Primary is forecast to be at capacity and very limited capacity to expand. Given an adequate site access is achievable but would require a number of works and the potential issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	No anticipated impact.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Thorverton. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Thorverton.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

3. Archaeological investigation and appropriate mitigation measures.

Land adjoining Poynings, Uffculme

Option

Land with a gross site area of 2.8 (ha) at Land adjoining Poynings, Uffculme is proposed for 35 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are a number of mature trees on the site which should be retained, a slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. There are views of the site from the east, and the landscape is punctuated by mature trees. Developing the site would impact on the landscape character of the area, particularly given its position on elevated land, a negative effect.	-2
B) Protection and promotion of a quality built and historic environment	Site is located close to Uffculme Conservation Area (to the south east), a slight negative effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent Conservation Area.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. There is a large dip in the middle of the field which may cause drainage issues, a slight negative effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	The site adjoins, but is not within a Minerals Consultation Zone, a neutral effect. Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 35 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	The site is remote from Uffculme which has a wide range of services including a shop, pub, church, post office, two schools, doctors' surgery and daily transport services. Uffculme is located near a bus route with an hourly or greater service, a overall slight negative effect.	-1

I) Delivering the necessary infrastructure	An adequate site access is achievable as access to the site is good, with good visibility, although it is located on a bend and just before the 30mph two lane road into the village. Chapel Hill which provides the route to the centre of Uffculme is narrow and lacks footways. There is an alternative pedestrian route, via Uffculme Footpath 46 and highland terrace, but this is a longer route. Primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. Secondary school is at capacity and will need to be expanded to support increased children in and around area. Given an adequate site access is achievable but there are potential issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Uffculme. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Uffculme.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land adjacent Sunnydene, Uffculme

Option

Land with a gross site area of 0.6 (ha) at Land adjacent Sunnydene, Uffculme is proposed for 10 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is slightly elevated but would not be overly dominant in the village context as neighbouring properties are set back from the site, though developing the site would extend the built environment further into the countryside, a slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-1
B) Protection and promotion of a	The site is located adjacent to the Uffculme conservation area, which is to the south east of the site, a slight negative effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent Conservation Area.	-1

quality built and historic environment		
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect as the site is relatively small. Given the loss of good / moderate quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 10 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	The site is remote from Uffculme which has a wide range of services including a shop, pub, church, post office, two schools, doctors' surgery and daily transport services. Uffculme is located near a bus route with an hourly or greater service, overall a slight negative effect.	-1
I) Delivering the necessary infrastructure	There is poor access to the site being located on a bend of a very narrow lane and Uffculme Road is subject to the national speed limit, a negative effect. If alternative access were required on the western edge of the site, development would impact on the adjacent allotments. Primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. Secondary school is at capacity and will need to be expanded to support increased children in and around area. Given an adequate site access is difficult to achieve and there are potential issues around education capacity an overall negative effect is considered.	-2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Uffculme. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Uffculme.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land west of Uffculme, Uffculme

Option

Land with a gross site area of 3.86 (ha) at Land west of Uffculme, Uffculme is proposed for 60 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site is within the 'Lowland plains' landscape character area. This area is characterised by having an open, low lying flat agricultural landscape. The fields to the north of the B3340 are partially screened from views by the existing field boundaries. The southern field is more open, and offers wider and more distant views to the south. All fields are divorced from the village of Uffculme and therefore development in this location would have an impact on the character of the immediate area, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	This site occupies a substantial area where prehistoric activity is recorded in the wider landscape, a slight negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, a neutral effect. The site is located opposite from the boundary of Bridwell Park, a nationally important grade I listed historic park and garden, a slight negative effect. Any future proposals would need to consider how best to mitigate the impact of this development on the adjacent grade 1 historic park and garden.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk with the exception of 1.2ha along southern boundary of south field located in flood zone 3, a negative effect. The site could contribute to surface water run off without appropriate mitigation measures, a further slight negative effect.	-2
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 60 new dwellings a contribution towards future housing need, a positive effect.	+2

H) Ensuring community health and wellbeing	The site is remote from Uffculme which has a wide range of services including a shop, pub, church, post office, two schools, doctors' surgery and daily transport services. Uffculme is located near a bus route with an hourly or greater service, overall a slight negative effect.	-1
I) Delivering the necessary infrastructure	Site access is achievable subject to any development requiring the extension of the 30 mph limit, a slight negative effect. The footway at Culm Valley Way would need to be extended to the site, a slight negative effect. Primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. Secondary school is at capacity and will need to be expanded to support increased children in and around area. Given an adequate site access is achievable but there are issues around education capacity, an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Uffculme. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Uffculme.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological mitigation and protection of historic park and garden.

Land off Chapel Hill, Uffculme

Option

Land with a gross site area of 2 (ha) at Land off Chapel Hill, Uffculme is proposed for 64 dwellings.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The village of Uffculme is surrounded by hills on all sides, and the site would be visible from a number of the surrounding ridgelines, a negative effect. There is a hedge to the east of the site and to the north the site is well screened, with views predominately into the site from the south. At this stage, the Council	-2

	is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	It is not anticipated that the development of this area will have an archaeological impact, a neutral effect. The site lies on the northern edge of the Uffculme Conservation Area and in close proximity to two listed buildings – The Mount and the Baptist Chapel, a slight negative effect. The impact of any development upon the setting of these designated heritage assets will need to be considered.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 64 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Uffculme has a wide range of services including a shop, pub, church, post office, two schools, doctors' surgery and daily transport services,. Uffculme is located near a bus route with an hourly or greater service, overall a slight positive effect.	+1
I) Delivering the necessary infrastructure	Adequate access can be achieved off Chapel Hill but there will need to be a suitable pedestrian footway over the frontage. Preference is for access to be taken from Highland Terrace but would require third party land. Chapel Hill needs to be widened to 5.5m passed the site with provision of footway linkages to Highland Terrace and over site frontage. Level differences may constrain opportunities to access the site and the junctions at either end of Chapel Hill with High street and with B3181 give cause for concerns and have limited opportunities for improvement, a slight negative effect Primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. Secondary school is at capacity and will need to be expanded to support increased children in and around the area, a negative effect. Given an adequate site access is achievable but there are issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years),	Within the short term, construction traffic associated with the development will contribute

Medium (6-15 years) Long (15+ years)	towards traffic congestion within Uffculme. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Uffculme.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land off Ashley Close, Uffculme

Option

Land with a gross site area of 1.18 (ha) at Land off Ashley Close, Uffculme is proposed for 20 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is steeply sloping and is visible within the wider landscape, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Within Hillhead Quarry mineral safeguarding area and will need to comply with policies in the Devon Minerals Local Plan, a slight negative effect. Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and location with the Hillhead Quarry Safeguarding Zone an overall slight negative effect is considered.	-2
E) Promoting economic growth	No impact.	0

and employment		
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 20 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Uffculme has a wide range of services including a shop, pub, church, post office, two schools, doctors' surgery and daily transport services. Uffculme is located near a bus route with an hourly or greater service, overall a slight positive effect.	+1
I) Delivering the necessary infrastructure	Access may be possible through Bellevue to the south although access would have to be via third party land which is currently subject to a planning application. Primary school will have limited spare capacity to support future development and is on a constrained site and not easily expanded. Secondary school is at capacity and will need to be expanded to support increased children in and around the area, a negative effect. Given an adequate site access is achievable but there are issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities including education capacity and the current provision of infrastructure.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Uffculme. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Uffculme.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Quicks Farm, Willand

Option

Land with a gross site area of 2.85 (ha) at Quick Farm, Willand is proposed for 68 dwellings.

Sustainability objective	**Commentary**	**Impact**
A) Protection of	The site is within the 'Lowland plains' landscape character area. This area is characterised by having an open, low lying flat	0

the natural environment	agricultural landscape. The site is flat and well screened by the boundary trees and other trees in the immediate area. Views into the site are very local from the adjacent farmland. There would be limited impact, a neutral effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	The site lies in an area of archaeological potential. Archaeological work to the west has demonstrated the presence of widespread archaeological material including a prehistoric field system and funerary monuments. Development here also has the potential to expose similar associated deposits, a slight negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 3 good / moderate quality agricultural land, a negative effect. Given the loss of good / moderate quality agricultural land and greenfield land an overall negative effect is considered.	-2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 68 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Willand has a number of services including a school, shop, pub, doctors, post office and petrol station. It also has access to a bus route with an hourly or greater service, a slight positive effect. The site is located within Cullompton catchment area and therefore has possible off-site air quality impact within Cullompton AQMA, a slight negative effect. Overall a neutral effect is considered.	0
I) Delivering the necessary infrastructure	An adequate access is achievable via the Quick's Farm access provided it was substantially improved and the 30 mph limit on Uffculme Road was extended to provide the required visibility, a neutral effect. Pedestrian and cycle provision would need to be provided as there are none at this location on Uffculme Road. Primary school is forecast to have some spare capacity to support future development but this will only be released if additional primary provision is provided in Cullompton as school currently draws from the town. Given an adequate site access is achievable and possible issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure. Development may contribute towards the junction capacity at M5 J27.
Temporary/permanent effects: Timescale: Short (1-5 years),	Within the short term, construction traffic associated with the development will contribute

Medium (6-15 years) Long (15+ years)	towards traffic congestion within Willand. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Willand.

Summary of Recommendations

1. Part of site carried forward as an affordable housing rural exception site with the remaining area seeking to achieve 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Land adjacent B3181, Willand

Option

Land with a gross site area of 1 (ha) at Land adjacent B3181, Willand is proposed for 39 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Wildlife surveys accompanying the planning application noted that badgers actively used the site but found no evidence of setts. No evidence of bat roosts were detected, though dormice and slow worm habitats were identified and will require habitat migration. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. Only the south west part is visible from any distance, the rest of the site is well screened by the existing boundary hedging and trees. Any impact is likely to be very low, a neutral effect.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. The site is located on Grade 1 excellent quality agricultural land, a significant negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of excellent quality agricultural land and greenfield land an overall significant negative effect is considered.	-3

E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 39 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Willand has a number of services including a school, shop, pub, doctors, post office and petrol station and has access to a bus route with an hourly or greater service, a slight positive effect. The site is located within Cullompton catchment area and therefore has possible off-site air quality impact within Cullompton AQMA, a slight negative effect. Overall a neutral effect is considered.	0
I) Delivering the necessary infrastructure	An adequate access is achievable, a neutral effect. There is a footpath along the main road which leads into the centre of the village, a neutral effect. Primary school is forecast to have some spare capacity to support future development but this will only be released if additional primary provision is provided in Cullompton as school currently draws from the town. Given an adequate site access is achievable and but there are possible issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure. Development may contribute towards the junction capacity at M5 J27.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Willand. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Willand.

Summary of Recommendations

1. Site carried forward as an affordable housing rural exception site.
2. Improved pedestrian links to the village and retention and enhancement of existing public right of way.
3. Measures to protect and strengthen trees, hedgerows, and other environmental features which contribute to the character and biodiversity, maintaining a wildlife network within the site and linking to the surrounding countryside.
4. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Land east of M5, Willand

Option

Land with a gross site area of 5.9 (ha) at Land east of M5, Willand is proposed for 142 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The woodland along the north eastern boundary is covered by a tree protection order, a negative effect. The site lies within the 'lowland plains' landscape character area which is typified by being an open, low lying flat landscape in a prosperous agricultural area. The site is flat in nature, and is well screened from views from the east by the presence of tall trees. There are some distant views from the west into the site. The existing adjacent housing is well screened by the high trees, and therefore any new developments would represent a change in the landscape character when viewed from the west, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	-2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. 3.7ha (43% of site, northern portion) is located on Grade 1 excellent quality agricultural land, a significant negative effect with the remaining 5 ha (57% of site, southern portion) located on Grade 3 good / moderate quality agricultural land, a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of excellent quality agricultural land and greenfield land an overall significant negative effect is considered.	-3
E) Promoting economic growth and employment	Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 142 new dwellings a contribution towards future housing need, a significant positive effect.	+3
H) Ensuring community health and wellbeing	Willand has a number of services including a school, shop, pub, doctors, post office and petrol station and has access to a bus route with an hourly or greater service, a slight positive effect. The site is located within Cullompton catchment area and therefore has possible off-site air quality impact within Cullompton AQMA, a slight negative effect. There are also possible concerns regarding developing new housing in close proximity to the M5 whereby noise impact may negatively affect residential amenity. On balance a slight negative effect is considered.	-1

I) Delivering the necessary infrastructure	An adequate access is achievable. Access from Meadow park verge would appear to be achievable as the verge is maintained by the Highway Authority although this is not shown on the land charges record only on the verge cutting schedule. The Site would serve Cul-de-sac style development and numbers would be dependent on Transport assessment of the junction with Silver St. The Track that runs to the south is not highway and does not appear to be ROW and must be assumed to be private. Primary school is forecast to have some spare capacity to support future development but this will only be released if additional primary provision is provided in Cullompton as school currently draws from the town. Given an adequate site access is achievable but there are possible issues around education capacity an overall slight negative effect is considered.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure. Development may contribute towards the junction capacity at M5 J27.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Willand. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Willand.

Summary of Recommendations

1. 35% affordable housing.
2. Noise mitigation measures due to proximity to the M5 motorway.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Dean Hill Road, Willand

Option

Land with a gross site area of 1.7 (ha) at Dean Hill Road, Willand is proposed for 54 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The area of the site sits on elevated ground (the adjacent M5 is at a considerably lower level). As a result the site has a relatively prominent place in the landscape, offering wide and far views to the west and south-west. The area around the site, partially due to its separation from Willand, is generally open countryside, being agricultural in nature. Developing the site would have an impact on the landscape character, particularly given that the existing housing at the site is relatively well screened	-2

	from views, a negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. Site is located on Grade 1 excellent quality agricultural land, a significant negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of excellent quality agricultural land and greenfield land an overall significant negative effect is considered.	-3
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 54 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Willand has a number of services including a school, shop, pub, doctors, post office and petrol station and has access to a bus route with an hourly or greater service, a slight positive effect. There are possible concerns regarding developing new housing in close proximity to the M5 whereby noise impact may negatively affect residential amenity. The site is located within Cullompton catchment area and therefore has possible off-site air quality impact within Cullompton AQMA, overall a slight negative effect is considered.	-1
I) Delivering the necessary infrastructure	An adequate access is achievable. Primary school is forecast to have some spare capacity to support future development but this will only be released if additional primary provision is provided in Cullompton as school currently draws from the town. Given an adequate site access is achievable but there are possible issues around education capacity, an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure. Development may contribute towards the junction capacity at M5 J27.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Willand. Once completed the development will be

	permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Willand.

Summary of Recommendations

1. 35% affordable housing.
2. Noise mitigation measures due to proximity to the M5 motorway.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Lloyd Maunder Way, Willand (Residential) Option

Land with a gross site area of 1.7 (ha) at Lloyd Maunder Way, Willand is proposed for 41 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	0.17 ha of site is covered by important mixed trees which are protected with tree preservation orders, a slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is flat and wedged between industrial uses and the M5. Views from the site are short and it is well screened, a neutral effect. The impact on landscape character is likely to be very low should the site be developed. Overall a slight negative effect is considered as a small area of the site is covered by important mixed trees.	-1
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	Development option is located on greenfield land which is considered to be negative impact on resource use. Site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect. Given the loss of good / moderate quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting	No impact.	0

economic growth and employment		
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 41 new dwellings a contribution towards future housing need, a positive effect.	+2
H) Ensuring community health and wellbeing	Willand has a number of services including a school, shop, pub, doctors, post office and petrol station and has access to a bus route with an hourly or greater service, a slight positive effect. There are possible concerns regarding developing new housing in close proximity to the M5 whereby noise impact may negatively affect residential amenity. The site is located within Cullompton catchment area and therefore has possible off-site air quality impact within Cullompton AQMA, overall a slight negative effect is considered.	-1
I) Delivering the necessary infrastructure	An adequate access is achievable Primary school is forecast to have some spare capacity to support future development but this will only be released if additional primary provision is provided in Cullompton as school currently draws from the town. Given an adequate site access is achievable but there are possible issues around education capacity an overall neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic, put pressure on services and facilities and the current provision of infrastructure. Development may contribute towards the junction capacity at M5 J27.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Willand. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Willand.

Summary of Recommendations

1. 35% affordable housing.
2. Noise mitigation measures due to proximity to the M5 motorway.
3. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.

Willand Industrial Estate, Willand

Option

Land with a gross site area of 10.4 (ha) at Willand Industrial Estate, Willand is proposed for 21,840 sqm commercial floor space.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	There are a number of protected trees in the site near the south eastern boundary. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site is hidden from the settlement by vegetation, but the site may be seen from the M5 if it is developed. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous, a neutral effect.	0
B) Protection and promotion of a quality built and historic environment	Previous archaeological work undertaken on this site demonstrated the presence of prehistoric activity within this site. Any planning application for development of the undisturbed parts of this site will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it, a slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	The site is located on part greenfield and part brownfield land, a neutral effect. The site is located on Grade 3 good / moderate quality agricultural land, a slight negative effect. Given the large scale loss of good / moderate quality agricultural land and greenfield / brownfield land an overall neutral effect is considered.	0
E) Promoting economic growth and employment	Option provides 21,840 sqm of commercial floorspace helping to diversify the economy, provide opportunities for local employees, reduce out-commuting and encourage inward investment, a positive effect.	+3
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	Willand has a local shop and access to a bus service. There are links to Willand and to a lane which leads to a cycle path that links Willand and Uffculme to Tiverton Parkway rail station and Tiverton. The allocation of commercial land within Willand could decrease air quality within the settlement through increased traffic movement and in particular HGV movements, a slight negative effect. Given the sustainable location for walking but potential for harm to air quality an overall slight negative effect is considered.	-1
I) Delivering the necessary infrastructure	Much of the site infrastructure is already in place and there is existing access into the site which could be improved to cover the whole of the site, a positive effect.	+2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic congestion.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Willand. Once completed the development will be

	permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs of Willand.

Summary of Recommendations

1. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
2. Archaeological investigation and appropriate mitigation measures.
3. Adequate access into the site for existing units immediately adjacent.
4. Provision of a cycle link from Muxbeare Lane to the existing industrial estate.
5. Provision of a footbridge along the north side of the south view road bridge over the former railway line.

Lloyd Maunder, Willand (Commercial) Option

Land with a gross site area of 4.2 (ha) at Lloyd Maunder, Willand is proposed for 8,820 sqm commercial floor space.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site contains 3.7ha of unconfirmed wildlife area, in the north of the site with development potentially impacting upon species diversity, it is assumed subject to further investigation work that this will have a slight negative effect. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site would not be visible from the settlement, and is surrounded by hedgerows and trees which would further screen the site. Given the presence of the unconfirmed wildlife area, a slight negative effect is considered.	-1
B) Protection and promotion of a quality built and historic environment	This site lies adjacent to the flood plain and such development in this area have the potential to expose waterlogged palaeoenvironmental deposits that can provide information on past land use and man's impact upon it. In addition, recent archaeological work at Four Ways Cross to the east has demonstrated the presence of significant amounts of prehistoric archaeological deposits and features. Lying between these recently discovered sites and the river the presence of prehistoric activity in this area cannot be discounted. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, a neutral effect.	0
C) Mitigating the effects of climate change	6.1 ha of the site is located on Flood zone 1 the lowest level of flood risk, 1.4ha was located in Flood zone 2 and 0.7ha located on Flood zone 3, a negative effect. The site could contribute to surface water run off without appropriate mitigation measures, a negative effect.	-2

D) Safeguarding and minimising resource use	The site is located on greenfield land which is considered to be negative impact on resource use. 2.1 ha to the (east) of the site is located on Grade 3 quality agricultural land with the remaining 2.1ha (west) located on Grade 4 agricultural land. Given the large scale loss of good / moderate / poor quality agricultural land and greenfield land an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	Option provides 8,820 sqm of commercial floorspace helping to diversify the economy, provide opportunities for local employees, reduce out-commuting and encourage inward investment, a positive effect.	+2
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	Willand has a local shop and access to a bus service. The allocation of commercial land within Willand could decrease air quality within the settlement through increased traffic movement and in particular HGV movements, a slight negative effect. Given the sustainable location for walking but potential for harm to air quality an overall slight negative effect is considered.	-1
I) Delivering the necessary infrastructure	The site is easily accessible from the B3181 with poor links to the village centre at present, a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon traffic congestion.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Sampford Peverell. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the employment needs of Sampford Peverell.

Summary of Recommendations

1. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
2. Archaeological investigation and appropriate mitigation measures.
3. Areas within the floodplain should be retained for green infrastructure.

Land off Lower Road, Yeoford

Option

Land with a gross site area of 0.7 (ha) at Land off Lower Road, Yeoford is proposed for 17 dwellings.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The site falls within the Lowland Plains Character Area which is typically present in the area around Crediton. It traditionally has an open, landscape which at times can be gently rolling. The northern element is largely sheltered from views into the site, and is largely flat. There are limited opportunities to view the southern site from the rest of the village, a neutral effect. Development of the site would extend the built form of the village further to the east, though a level of mitigation would be provided by the existing adjoining housing and the modern farm buildings that abut the southern site. At this stage, the Council is not aware of the presence of protected species or habitats. Further site-specific evidence will be procured for preferred sites in 2014, and the results will be used to update this sustainability appraisal accordingly.	0
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential on the edge of the historic core of the settlement at Yeoford, a slight negative effect. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required depending upon the nature of the proposed development here, a neutral effect. There are a number of listed buildings within the centre of Yeoford. The southern portion of site is adjacent to a small section of the Yeoford Conservation Area, an overall slight negative effect.	-1
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures, a slight negative effect.	-1
D) Safeguarding and minimising resource use	The site is located largely on greenfield land however within the northern part there is a used, but tired agricultural barn of timber, block and corrugated iron construction, a negative effect. The site is located on Grade 3 good /moderate quality agricultural land, a slight negative effect as the site is relatively small. Given the loss of good / moderate quality agricultural land and greenfield land, a slight negative effect is considered.	-1
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	Option provides for 17 new dwellings a contribution towards future housing need, a slight positive effect.	+1
H) Ensuring community health and wellbeing	Yeoford is remote from services but lies on a bus route operating a less than daily service and Yeoford rail station is within walking distance, a neutral effect.	0
I) Delivering the necessary	Adequate highway accesses are achievable for both sites however the wider local highway network consists of narrow roads having restrictive alignments, a slight negative effect. Primary school is forecast to have limited spare capacity to support development	0

infrastructure	and has limited capacity to expand. Given an adequate site access is achievable but the local highway network consists of narrow roads and there are possible issues around education capacity, an overall neutral effect is considered.	

Secondary/cumulative/synergistic effects:	No anticipated impact.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic congestion within Yeoford. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the housing needs of Yeoford.

Summary of Recommendations

1. 35% affordable housing.
2. Provision of Sustainable Urban Drainage (SUD) Scheme to deal with all surface water from the development and arrangements for future maintenance.
3. Archaeological investigation and appropriate mitigation measures.

Managing Development Policies

Please note the original DM 1 'Presumption in favour of sustainable development' now sits at the front of this plan and has been given the policy number S1.

Policy DM2 High quality design

This policy recognises the importance of good design as a key aspect of sustainable development, setting out key principles to be adhered to. It requires development to have a clear understanding of character, context and surrounding area. New development is required through the policy to make a positive contribution to local character, create safe places, encourage sustainable transport and take account of architecture, layout, siting, scale, massing, orientation, fenestration, materials, landscaping and green infrastructure. There is also a requirement for major residential developments to achieve a 75% score against the Building for Life standard. The policy may need to be revised to take account of the Government's review of housing standards.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Criteria within the policy states that development should demonstrate a clear understanding of the characteristics of the site, wider context and the surrounding area as well as a positive contribution to the local character including biodiversity assets, a positive effect on the natural environment.	+2
B) Protection and promotion of a quality built and historic environment	The policy states that the design of new development must be of high quality and based on set principles: characteristics of the site, efficient and effective use, positive contribution to local character, creation of safe and accessible places, visually attractive places including taking into account Architecture, Siting, layout, scale and massing, orientation and fenestration, materials and landscaping and green infrastructure and appropriate use of sustainable urban drainage schemes. Major proposals will be expected to achieve 8 out of 12 against the building for life criteria. The policy also requires development to make a positive contribution to character including heritage assets, and therefore scores positively for the effect it should have on listed buildings, historic parks and gardens and the character of conservation areas. The policy's focus on architecture, scale, and materials ensure that the details that contribute towards historical character are positively emphasised. Overall this policy will have a significant positive effect.	+3
C) Mitigating the effects of climate change	Criteria within the policy seek the efficient and effective use of sites, a positive effect. Policy criteria seek appropriate drainage including sustainable urban drainage systems (SUDs) and connection of foul drainage to a main sewer where available, a positive effect. The policy requires major developments to meet 75% of the criteria within the Building for Life criteria – these standards cover a range of issues which include access to public transport and the reduction of environmental impact. Through designs that maximise opportunities for the use of sustainable transport modes such as walking, cycling and public transport and environmental improvements incorporating facilities such as plug-ins for ultra-low emission vehicles, carbon emissions can be reduced, a significant positive effect towards climate change	+3
D) Safeguarding and minimising resource use	The policy requires major developments to meet 75% of the criteria within the Building for Life standard, which covers a range of issues which include assessing potential of any older buildings or structure for conversion and providing convenient, dedicated bin and recycling storage, a positive effect.	+2
E) Promoting	No impact.	0

economic growth and employment		
F) Supporting retail	No impact.	0
G) Meeting housing needs	Criteria in policy seek high quality development that create visually attractive places that do not adversely effect on the privacy and amenity of proposed neighbouring properties, a positive effect.	+2
H) Ensuring community health and wellbeing	Criteria within the policy seek the creation of safe and accessible places that encourage sustainable modes of travel such as walking and cycling, a positive effect.	+2
I) Delivering the necessary infrastructure	Proposals should take into account green infrastructure, a positive effect.	+2

Secondary/cumulative/synergistic effects:	This policy will complement a number of other policies within the plan. Particularly DM3 (sustainable design) through the incorporation of Sustainable Urban Drainage Systems (SUDS) where appropriate; DM6 (transport and air quality) through prioritising sustainable modes of transport in developments, particularly walking and cycling; and DM14 (design of housing) through complementary approaches to high quality local places, daylight, orientation, materials etc; and DM27 (heritage assets) as the policy requires development to make a positive contribution to local character.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, as this policy will apply to all new development that takes place in the district over the lifetime of the plan. Immediate to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA

Policy DM3 Sustainable design

This policy incorporates sustainable design features into proposals for new housing and major commercial development, thereby reducing negative environmental and social impacts. The policy required applicants to demonstrate that developments are energy and water efficient and resilient to climate change. The Code for Sustainable Homes and BREEAM are used to determine compliance with the policy, with the level of achievement required to meet the policy rising over time. The policy may need to be revised following the outcome of the Government's consultation on the review of housing standards.

Sustainability	**Commentary**	**Impact**

objective		
A) Protection of the natural environment	It is possible that there could be some negative impacts arising from the requirement to cut carbon emissions, particularly by using more visual forms of renewable energy technologies. For example, developments that include photovoltaic panels could have a negative effect on valued landscapes. However such proposals for development will also have to consider their impact on protected landscapes to ensure a level of control. Given this mitigation a neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	It is possible that there could be some negative impacts arising from the requirement to cut carbon emissions, particularly by using more visual forms of renewable energy technologies. For example, developments that include photovoltaic panels could have a negative effect on the character of conservation areas. However such proposals for development will have to consider their impact on heritage assets which will ensure a level of control. Given this mitigation a neutral effect is considered.	0
C) Mitigating the effects of climate change	Policy requires proposals involving the construction of new buildings to demonstrate how sustainable design and construction methods will be incorporated to achieve energy and water efficiency and resilience to climate change. Design must use landform, layout, building orientation, massing and landscaping to minimise energy consumption. Major housing development should meet the Code for Sustainable Homes levels. Major commercial development will be required to meet BREEAM standards. If evidence demonstrates the development is unachievable the benefits of the proposal will be weighed against the objective of the policy. The Code for Sustainable Homes covers a range of criteria from which developers are able to pick and choose the elements that they wish to deliver in order to obtain the required number of credits. Therefore it is difficult to be absolutely certain of each positive impact against the sustainability framework, but overall the impacts on carbon emissions are likely to be the most certain. The policy will contribute to reducing carbon dioxide emissions and increasing renewable energy capacity, a significant positive effect.	+3
D) Safeguarding and minimising resource use	The code requires developments to tackle waste, a positive effect.	+2
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	The Code for Sustainable Homes has an objective to reduce NOx emissions, and therefore implementation of the policy could result in a positive impact on air quality.	+2
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Indirect effects may include the need for more assessors who can complete BREEAM or Code for Sustainable Homes assessments and sign-off post-construction certificates. Synergistic effects include how the policy complements others which include other building standards. For example, builders of a major housing development will need to comply with Code for Sustainable Homes requirement (from Policy DM2), Building for Life (from Policy DM2) and Lifetime homes (from Policy DM14). However these requirements can be collectively undertaken as part of the Code for Sustainable Homes design stage; in particular Lifetime homes is already one of the credits under the Code's 'Health & Well-being' category. Other synergistic impacts relate to the visual impact of renewables technologies, and their potential impact on valued landscapes and heritage assets as discussed above. Such proposals would also be considered against DM27 (heritage assets) and DM29 (protected landscapes) to mitigate against potential negative impacts.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, as the policy is a mechanism to reduce carbon emissions that arise as a result of the 'lifetime' of a building. Short to long term, though the policy will set a higher standard from 2016, so there will be changes in the short term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA

Policy DM4 Waste management

This policy sets out requirements for development proposals to give consideration to the management of waste during construction and operation. In particular it includes a 'waste hierarchy', based on national waste policy that seeks to reduce the amount of waste that goes to landfill. While there is some overlap with Policy DM/3, this policy goes further in setting out a hierarchy. Also not all homes developed in accordance with the Code for Sustainable Homes will choose the waste credits in order to meet their overall total.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	No impact.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the	No impact.	0

effects of climate change		
D) Safeguarding and minimising resource use	Development proposals must demonstrate that the construction and operation of development will accord with sustainable waste management principles. A waste audit statement will be required for all major development in accordance with the proposed waste hierarchy. The policy clearly sets out at a local level a waste hierarchy to guide development. Planning cannot change people's behaviour once a development is in operation, however it can influence the choices people make by providing opportunities for reducing waste/recycling/composting etc. This policy therefore is highlighted as having a positive sustainable impact through the reduction of waste and of carbon dioxide emissions that would otherwise have been expended in processing of waste and production of new products, a significant positive effect.	+3
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	No impact.	0
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Secondary indirect effects are likely to include a reduction in land use for landfill, and the negative environmental impacts associated with landfill. Synergistically the policy complements DM3 (sustainable design) which includes waste as one of the options that development could choose to select in order to meet the criteria of the Code for Sustainable Homes; this policy ensure that waste considerations must be tackled on major developments (under policy DM3 a developer would not necessarily have to select waste as one of its credits to achieve the overall Code requirement). The policy also complements DM14 (design of housing) which has a requirement for homes to be designed with provision for recycling and waste storage.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Temporary in that waste during construction of major developments is subject to this policy; permanent in that sustainable development principles have to be incorporated into the design of the development for the lifetime of its operation. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM5 Renewable and low carbon energy

The policy requires proposals for renewable or low carbon energy to be weighed against their impact. The policy recognises the importance of delivering low carbon or renewable technology, but understands that there are other considerations that need to be taken account of in order for such developments to be acceptable in planning terms. The policy text has been updated from LP3 to list proposals for renewable or low carbon energy will be permitted where they do not have a significant adverse impact on character, amenity, visual quality, "the community and agricultural land" of the area reflecting Government guidance. Requirement's for Environmental Impact Assessment has been deleted and the term "similar developments" will be clarified in the supporting text.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The policy requires development proposals to take account of landscape character, which could be detrimentally affected by renewable technology development, for example where large scale solar farms are proposed in sensitive landscapes. In order to mitigate against such issues the policy requires the benefits of proposals to be weighed against their impact, and does not permit such development where it would have a significant effect on 'character, amenity and visual quality of the area'. The policy seeks to reduce the likelihood of habitat fragmentation and to consider the environmental amenity of nearby properties. Such proposals would also have to be assessed against other policies within the Local Plan, which provide protection for landscapes, a positive effect.	+2
B) Protection and promotion of a quality built and historic environment	The policy requires development proposals to take account heritage assets, which could be detrimentally affected by renewable technology development, for example where solar panels are proposed on listed buildings or buildings in a conservation area. In order to mitigate against such issues the policy requires the benefits of proposals to be weighed against their impact, and does not permit such development where it would have a significant effect on 'character, amenity and visual quality of the area'. Such proposals would also have to be assessed against other policies within the Local Plan, a positive effect.	+2
C) Mitigating the effects of climate change	Proposals for renewable or low carbon energy will be permitted where they do not have a significant adverse impact, a positive effect towards mitigating climate change. The policy contains a number of factors to mitigate against a number of possible negative aspects of renewable and low carbon development including having regard for character, amenity, visual quality of the area, agricultural land value and biodiversity. The policy represents a significant positive impact on delivering the objective.	+3
D) Safeguarding and minimising resource use	The policy, by permitting renewable energy generation, could reducing district-wide and nation-wide reliance on other forms of energy, such as those derived from fossil fuels. This could have a significant impact on reducing the loss of limited resources. The policy requires development to recognise the quality and productivity of agricultural land including the quality and productivity of the best and most versatile agricultural land (grade 1, 2 & 3a). Overall the impacts are considered to significantly contribute	+3

	towards achieving the objective.	
E) Promoting economic growth and employment	Renewable energy schemes can provide a form of alternative income, particularly for farmers wishing to diversify from traditional land uses. Overall, a slight positive outcome has been assumed as a result.	+1
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	There are positive and negative impacts in terms of public support, which vary depending on the individual proposal in question. Overall a neutral impact has been assumed, given the both positive and negative feedback the Council has previously received about such projects.	0
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Wind turbines can have cumulative impacts on a landscape, particularly where isolated small scale developments are granted, eventually dotting the landscape. The policy requires development not to have significant adverse impacts, including cumulative impacts in relation to other similar developments, with many developments being required to support their application with a Landscape and Visual Impact Assessment (LVIA). The policy also works in tandem with DM6 (transport and air quality) to consider the environmental amenity of nearby properties, and with DM29 (protected landscapes) and DM30 (other protected sites) to provide protection against habitat fragmentation.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The scoping stage of installing renewable energy technology to investigate feasibility, such as the installation of anemometer masts to assess wind speeds, will have a temporary effect on the landscape, as temporary permissions are often granted for the masts. Large renewable projects, such as solar farms are often granted long-term permissions, for example 25 years, so that once the Fed In Tariff expires, the facility is required to be removed, in order to protect the landscape and best agricultural land. Immediate to long term as an increasing number of applications have been received in recent years, which is likely to increase as time progresses given the pressures to reduce carbon emissions as a result of climate change.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM6 Transport and air quality

The policy aims to manage the impact of additional transport on air quality arising from development proposals. The policy requires major development that significantly increases levels of movement to be accompanied by an integrated Transport Assessment, Travel Plan, Environmental Statement and Low Emission Assessment. Where Low Emission Assessments are required the policy requires them to specify their impact on existing Air Quality Management Areas, to set out modelling of transport emissions and onsite mitigation measures to off-set negative impacts on air quality. The impacts of transport emissions on environmental assets must also be assessed and mitigated where necessary.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The impacts of transport emissions on environmental assets must also be assessed, with the policy requiring mitigation measures to reduce negative impacts.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The policy requires major development that significantly increases levels of movement to be accompanied by an integrated Transport Assessment, Travel Plan, Environmental Statement and Low Emission Assessment. Through the implementation of the requested statements it is anticipated that traffic movements in new development can be reduced, thereby decreasing traffic CO2 pollution, a positive effect.	+2
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	The impact on town centres could also be a positive factor. Cullompton and Crediton are both Air Quality Management Areas, with Tiverton at risk of being classified in addition. It is noted that the poor air quality, caused by the significant amount of road traffic through Cullompton and Crediton, has a link to the viability and vitality of the town centre. This policy may have a positive effect on the town centres through the requirement for development in those areas to provide on-site mitigation to reduce negative impacts on air quality.	+2
G) Meeting housing needs	No impact.	0
H) Ensuring	It is acknowledged that new development can result in an increase in transport and associated emissions, a negative effect.	+2

community health and wellbeing	Without this policy in place only the site specific measures on the largest allocations will apply. These provide a level of protection, however the policy has a specific requirement for major development to provide low emission assessments and associated on site mitigation measures that include encouraging public transport, walking and cycling. This provides a mechanism for addressing negative air quality impacts, whilst also encouraging the introduction of low emission technologies, such as electric charging points, thereby creating the infrastructure for longer term climate change mitigation, an overall positive effect.	
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Emissions can have significant indirect negative impacts on biodiversity and in particular on protected species. The policy links to Policy DM30 (other protected sites) in order to provide protection for sites that may be vulnerable due to their proximity to major roads (such as the Rackenford Special Area of Conservation near to the A361).
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Temporary effects will arise during construction phase, for which the provision of Travel Plans are designed to allow developments to set out alternative sustainable modes of transport as a means of accessing the development site. Permanent effects should be highlighted within the supporting evidence submitted with an application, and mitigation required. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM7 Pollution

This policy aims to protect individuals, the natural environment and general amenity from the harmful effects of noise, odour, light, air, water, land and other forms of pollution. The policy requires development to provide an impact assessment of the effects of pollution from development and details of mitigation where necessary.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	The policy acknowledges that development may have a negative impact on the quality of the environment through the direct, indirect and cumulative effects of pollution. However, the policy only permits development where these effects do not have an unacceptable negative impact. Whilst this is a general policy, it is anticipated that with it in place, there is an additional level of protection against developments that would pollute the local environment, a positive effect.	+2
B) Protection and promotion of a	No impact.	0

quality built and historic environment		
C) Mitigating the effects of climate change	No impact.	0
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	There could be a positive impact on town centres as a result of implementing the policy. Cullompton and Crediton are already Air Quality Management Areas, with Tiverton at risk of being classed in addition. The various forms of pollution can have a damaging impact on the vitality of a town centre. This policy may result in mitigation schemes being put in place within town centres to address potential negative impacts.	+2
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	The policy acknowledges that development may have a negative impact on the quality of the environment through the direct, indirect and cumulative effects of pollution including on light, air, odour and noise. However, the policy only permits development where these effects do not have an unacceptable negative impact. Whilst this is a general policy, it is anticipated that with it in place, there is an additional level of protection against developments that would pollute the local environment, a positive effect.	+2
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Traffic pollution from individual vehicles can have a low level impact, but indirectly and cumulatively there can be more significant impacts on amenity, biodiversity and the environment. The policy seeks to minimise such unacceptable negative impacts. Synergistically the policy also complements DM3 (sustainable design) which has the option for development to tackle NOx Emissions as a credit towards meeting the Code for Sustainable Homes criteria; having this policy work in tandem with DM3 ensures that the effects of pollution are considered and where necessary mitigated on all development, not just on those where it is selected as a credit towards achieving the Code level.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Temporary, in that some pollution may result during construction; however it is the lifetime of a development where pollution will continue to have an effect. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM8 Parking

The policy takes account of the fact that car ownership is predicted to increase, rather than decrease, over the next 10-15 years, and particularly reflects the importance of car usage in Mid Devon due to its rural nature. Rather than try to limit car usage through applying maximum parking standards, the policy seeks to provide adequate parking, and seeks to deliver low emission vehicle infrastructure to new developments. This recognises that restrictions in parking do not correspond to a reduction in car ownership, which has caused increasing congestion within residential areas. A parking SPD has been produced which provides further guidance. The policy has been updated from LP3 to clarify the retail requirements and "Gross floor area" as opposed to "shop floor area".

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	No impact.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The analysis highlights that the policy has potentially a mixed outcome in terms of reducing carbon dioxide emissions. This is because the positive benefits of using electric vehicles is to some extent offset by the fact that their production incurs a high carbon cost, whilst the electricity that powers them may be derived from fossil fuels, which are a finite resource. However the supporting text does encourage the option for other alternative fuel sources to be used in future.	0
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	The proposed parking standards for non-residential development is unlikely to change the approach that has previously been applied, and is not expected to result in any new negative impacts, a neutral effect.	0
F) Supporting retail	The proposed parking standards for non-residential development is unlikely to change the approach that has previously been applied, and is not expected to result in any new negative impacts, a neutral effect.	0

G) Meeting housing needs	These are related to the delivery of affordable housing, as the requirement to deliver low emission technologies adds an additional requirement and cost to developers which may impact on viability. However, building EV charging infrastructure into a development alongside all the other utilities infrastructure is likely to be far cheaper than retro-fitting, and is not considered to impose an excessive burden on development, a slight positive effect. The application of minimum parking standard has implications for the land take of development, as requiring more parking is an additional requirement on space within a development. Therefore, it is possible that this requirement may result in a squeeze on other land-based uses within a development, such as garden sizes, or could perhaps result in a reduction in the overall number of dwellings to be constructed on a given site (and hence would lower the ratio of dwellings per hectare). However, given that residential sites can exceeded the proposed minimum, it is considered that the standard does not place a disproportionate burden on development. Therefore, the implementation of a minimum parking standard is considered to have a balanced/neutral impact, taking account of some positive and some negative impacts arising.	0
H) Ensuring community health and wellbeing	It is difficult to be absolutely certain about the positive outcomes, given that low emission technologies are relatively new, though there should be beneficial impacts on public transport and opportunities for walking and cycling, a slight positive effect.	+1
I) Delivering the necessary infrastructure	The success of the policy will be greatly determined by the introduction of affordable mass-market low emission vehicles. The introduction of low emission infrastructure alone is unlikely to be sufficient to change car ownership preference from petrol/diesel usage to more sustainable alternatives. However, without infrastructure in place to enable residents and businesses to charge/re-fuel low emission vehicles there would be a significantly reduced likelihood of the technologies taking hold in the district. It is likely that residents will continue to make use of traditional diesel/petrol vehicles until mass market low emissions technology becomes common across the country, thereby driving down costs, a slight positive effect.	+1

Secondary/cumulative/synergistic effects:	The impact on the use of electric vehicles is likely to have a cumulative effect, as a 'critical mass' will need to be reached in terms of the availability of infrastructure and reduced costs of vehicles for their wider use to take place. Synergistically, this policy, and others such as DM11 (conversion of rural buildings) and DM20 (rural employment development) is unlikely to lead to a reduction in car use in the countryside; more likely car usage may be increased as a result.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The impact will be permanent in relation to setting the amount of parking available per development, and through permanent installation of electric vehicle charging infrastructure. Immediate to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

NB: Policy DM9 from the Local Plan Part 3, previously titled 'Cross subsidy of affordable housing on exception sites', has been revised and combined with another existing policy. The SA of the revised version, entitled 'Rural exception sites for affordable housing' can be found at the end of this document.

Policy DM10 Rural workers dwellings

This policy permits the development of housing for rural workers outside of defined settlement limits, providing a criterion based approach when this can take place: the nature and demand of an existing rural business are such that a full time need to be a permanent resident, the need cannot be met elsewhere (a nearby settlement or dwelling), the size and scale of the residence is commensurate with the scale of operation and the rural enterprise has been established for at least three years and is financially sound. Where a rural business is not established the policy allows for a mobile home on a temporary period against set criteria. Permission will also be subject to an occupancy condition.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Negative impacts could arise from development taking place within the open countryside to the detriment of the surrounding landscape. To minimise the harm, the policy has been worded so that the scale of any building is proportionate to the size of the enterprise, and that it reflects the location and setting of the site. Given the proposed mitigation measure an overall slight negative effect is considered.	-1
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The location of the dwelling, outside of a settlement is likely to lead to increased car usage in order to access services that potentially could be some distance away, resulting in increased carbon emissions, a negative effect. In order to minimise such harm, developments will only be permitted where there is no existing housing or conversion of existing buildings is not an option, thereby reducing opportunities where the policy will apply. Given the proposed mitigation measure an overall slight negative effect is considered.	-1
D) Safeguarding and minimising resource use	This policy permits the development of housing for rural workers outside of defined settlement limits. In order to minimise such harm, developments will only be permitted where there is no existing housing or conversion of existing buildings is not an option, thereby reducing opportunities where the policy will apply. Given the proposed mitigation measure an overall slight negative effect is considered.	-1
E) Promoting economic growth and employment	The policy will positively help a rural business where the need for a worker to be permanently on site is essential to the success of the enterprise, a positive effect.	+2
F) Supporting retail	No impact.	0
G) Meeting	The policy will deliver a limited number of new housing where there is a rural need, a positive effect. This policy attaches a planning	+2

housing needs	condition to rural workers dwellings, tying the dwelling to the agricultural or occupancy use. The removal of a tie is restricted to situations where the use is no longer needed, and requires provision of strong evidence as justification. Whilst not classed as affordable housing, this type of housing could be considered low cost. The tie placed on the building by a planning condition effectively keeps the cost of the property to a level that makes it more affordable to rural workers, thereby possibly providing a form of lower cost housing that meets a local need. Whilst this cannot be highlighted on the sustainability appraisal as having a positive effect on 'affordable housing', it does have a local positive impact.	
H) Ensuring community health and wellbeing	By providing rural workers' dwellings, the policy may permit people to remain living in places from which they originate, where otherwise, many people may have had to move away to find suitable affordable accommodation. A slight positive impact is anticipated.	+1
I) Delivering the necessary infrastructure	The policy may result in more homes being built in the open countryside which cumulatively could impact on local infrastructure including traffic, schools and health services, a negative effect.	-2

Secondary/cumulative/synergistic effects:	The policy may result in more homes being built in the countryside which cumulatively could impact on the landscape. Any proposals would be determined with regard to DM2 (high quality design) and also Mid Devon's Landscape Character Assessment and the Landscape Sensitivity Assessment. This will have secondary effects on the availability of agricultural/forestry/other important rural labour in the vicinity. The policy should have a positive impact in this regard.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The policy permits temporary dwellings where a firm intention to establish a rural enterprise is demonstrated, which will result in dwellings appearing for a limited period. Otherwise, the construction of rural workers dwellings is likely to have a permanent impact. The effects will be permanent for occupancy conditions, though the policy does set criteria whereby an occupancy condition can be removed. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM11 Conversion of rural buildings

This policy permits the conversion of redundant or disused rural buildings to a residential or employment use. The policy recognises the importance of rural buildings to the landscape and character of Mid Devon and permits their conversion where proposals meet a number of criteria regarding access, design, amenity and compatibility with rural character. The policy has been updated from LP3 to clarify that it applies to local character.

Sustainability objective	**Commentary**	**Impact**

A) Protection of the natural environment	Rural buildings such as barns can provide habitats for creatures such as barn owls and bats, particularly if the buildings have been redundant for some time, and therefore negative effects could be anticipated. However, criteria within the policy seek to retain any nature conservation interest associated with the site or building and provide a net gain in biodiversity where possible, and the supporting text requires provision of a habitat survey and makes reference to other legislation that exists to provide protection for priority species, a positive effect. Other effects include the impact on the rural landscape of the district. Rural buildings contribute positively towards the character and appeal of the district. Inappropriate conversion of such buildings to a residential or employment use could therefore have a negative impact. The policy seeks to improve the landscape by retaining buildings of character – others will eventually be knocked down, a positive effect. Given the negative effect to nature conservation / landscape through conversion but mitigation measures available an overall neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	Rural buildings contribute positively towards the character and appeal of the district. Inappropriate conversion of such buildings to a residential or employment use could therefore have a negative impact. The policy seeks designs that will retain the original character of the building and its surrounds, a positive effect. Given the negative effect to through conversion but the mitigation measures available an overall neutral effect is considered.	0
C) Mitigating the effects of climate change	The policy could have an effect on carbon emissions. Locating development away from existing settlements is likely to lead to increased car usage, given the low levels of public transport in the more rural parts of the district. Further negative impacts will be felt in terms of waste, as the creation of isolated homes in the countryside requires services, such as waste collection to come to them. This has implications for carbon usage in increasing the length of collection rounds, as well as increasing the cost of services. To some degree there will be a positive impact on carbon emissions as converting an existing building will use less energy than constructing a brand new dwelling. Given the negative effect through the creation of isolated homes in the countryside but mitigation measures available an overall slight negative effect is considered.	-1
D) Safeguarding and minimising resource use	Further negative impacts will be felt in terms of waste, as the creation of isolated homes in the countryside requires services, such as waste collection to come to them. To some degree the re-use of rural buildings is a positive effect. Given some positive and some negative impacts, and overall neutral impact has been considered.	0
E) Promoting economic growth and employment	There are positive impacts on the provision of employment floorspace in rural areas as a result of converting rural buildings for a commercial purpose. Tourism could also be affected as the rural nature is central to the attraction of the district. To mitigate against such impacts the policy requires a conversion to be undertaken without significant alteration to existing building, to retain the original character of the building and surrounding landscape, and to result in an overall enhancement to the immediate vicinity as required by the NPPF. Given the positive effect of employment floorspace and negative effect to tourism through conversion but mitigation measures available an overall neutral effect is considered.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	There are positive impacts on the number of houses created, in rural areas.	+2
H) Ensuring community health and wellbeing	No impact.	0

I) Delivering the necessary infrastructure	The policy may result in more homes being built in the open countryside which cumulatively could impact on local infrastructure including traffic, schools and health services, a negative effect.	-2

Secondary/cumulative/synergistic effects:	The conversion of rural buildings to residential use will increase the number of people living in the countryside; this has effects in terms of carbon emissions and services reaching those dwellings. Synergistically, when assessed alongside Policy DM20 (rural employment development) which sets criteria by which new employment development can take place in the countryside, both policies will be adding to the number of people not living and working in the main settlements. However there is a limited stock of available buildings for conversion, so it is anticipated that these effects will not be too significant.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once converted, those buildings cannot be used again for their original purpose. However the policy stipulates that any conversion must result in an enhancement of the setting, thereby having a positive permanent effect on the landscape. Immediate to long term. Proposals for conversion of rural buildings could be submitted immediately given the provisions of the NPPF.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM12 Replacement dwellings in rural areas

This policy permits the replacement of existing dwellings with new buildings, but limits the floorspace to no greater than that of the original property.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	To ensure the character of the area is not harmed, the size of new dwellings will be restricted to that of previous dwellings except where there are any unspent permitted development rights, a positive effect on the districts landscape.	+2
B) Protection and promotion of a quality built and historic environment	To ensure the character of the area is not harmed, the size of new dwellings will be restricted to that of previous dwellings except where there are any unspent permitted development rights, a positive effect on the districts built and historic environment.	+2
C) Mitigating the effects of climate	In terms of carbon emissions the construction of a new building will result in the use of large amounts of emissions during the manufacture of the materials and during construction. However a new building will have to adhere to higher standards of energy	0

change	efficiency as set out by building control and Policy DM3 (sustainable design) set out in this document, which will act positively against the negative impacts. A new building may also feature renewable energy technologies as part of the design, thereby increasing the capacity of the district. 20% of new buildings will also have to be constructed to Lifetime Homes standards; therefore some replacement buildings will meet this standard. Given the negative effect associated with construction but mitigation measures proposed, an overall neutral effect is considered.	
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	A general beneficial impact of the policy is that it may allow sub-standard homes to be improved, a positive effect.	+2
H) Ensuring community health and wellbeing	No impact.	0
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Synergistically this policy will be read in conjunction with policies DM2 (high quality design) and DM14 (design of housing) thereby ensuring that any replacement dwellings are built to a high standard, improving the quality of the housing stock across the district.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Replacement buildings will be permanent additions to the landscape. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM13 Residential extensions and ancillary development

This policy sets out the conditions under which extensions to existing dwellings and any other ancillary development can take place.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Extensions and ancillary development can have an impact on an area, though the scale of the impact is typically determined by the size of the development. Small domestic extensions, where there are few immediate neighbours can have very little impact. Larger extensions, taking up significant parts of a garden, or that affect the amenity of neighbours, or are in a rural location and visually impact on the quality of a landscape can be particularly detrimental to the local environment. Given the positive and negative effects an overall neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	Extensions and ancillary development can have an impact on building character, a negative effect. Criteria within the policy require development to respect the character, scale, setting and design of the existing dwelling, a positive effect. Given the positive and negative effects an overall neutral effect is considered.	0
C) Mitigating the effects of climate change	In terms of climate change impacts, permitting extensions increases the footprint of a property, and thereby the energy consumption of a property, a slight negative effect.	-1
D) Safeguarding and minimising resource use	The land an extension is built on is often classed as previously developed land, which is being reused, a slight positive effect.	+1
E) Promoting economic growth and employment	Householder applications make up approximately 30% of the applications received by Mid Devon District Council and these typically request planning permission for extensions. The building work undertaken for this type of development is an important part of the local economy and is typically undertaken by local self-employed building contractors or small firms, an overall positive effect.	+2
F) Supporting retail	No impact.	0
G) Meeting housing needs	In rural areas adding an extension to a property can significantly increase the desirability and therefore the price of a dwelling. The reduction of 'lower cost' housing in rural areas contributes towards gentrification and creates less sustainable communities. On the reserve of this however, permitting someone to extend their home may remove their need to move home, either to a bigger property, or to one that is designed to meet their needs, e.g. if they have a disability. In such cases allowing them to extend their own home may mean they do not need to join a waiting list for an adapted local authority or housing association property. Given the positive and negative effects an overall neutral effect is considered.	0
H) Ensuring community health and wellbeing	Residential extensions and ancillary development could harm the living conditions of neighbours through the loss of light, privacy, and overbearing or over-dominating effect, a negative effect. Criteria within the policy state that development will not have a significant adverse impact on the living conditions of occupants of neighbouring properties and will not result in the over-development of the dwelling curtilage. Given the negative effects but mitigation available, an overall neutral effect is considered.	0
I) Delivering the	No impact.	0

necessary infrastructure		

Secondary/cumulative/synergistic effects:	The local street scene can be affected by many properties adding extensions. Extensions may also present opportunities for home working.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once built, extensions and ancillary development are permanent additions. Immediate to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM14 Design of housing

This policy seeks to guide the development of new housing within the district. It stipulates requirements to deliver a high quality housing design, including provision of adequate space for storage, adaptability, private amenity space and a proportion of homes to meet lifetime homes standard and in accordance with car parking standards. The policy has been updated from LP3 to include "type" within point e).

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The policy requires the delivery of high quality places that take account of local character, physical context, density and land use mix, an overall positive effect for the protection of the natural environment.	+2
B) Protection and promotion of a quality built and historic environment	The policy requires the delivery of high quality places that take account of local character, physical context, density and land use mix, a significant positive effect for the promotion of a quality built environment.	+3
C) Mitigating the effects of climate change	Housing development should include space for cycle storage, a positive effect. Criteria within policy seek sustainable forms of development that maximise the natural benefits of the site through design, materials, technology and orientation, a further positive effect.	+2
D) Safeguarding and minimising resource use	Adaptable dwellings that can accommodate a range of occupiers and their changing needs over time which will include the provision of a stairway suitable for stair lift installation or space for the provision of a lift in homes with more than one storey, allowing residents to remain in their homes for longer is considered a positive effect.	+1
E) Promoting	No impact.	0

economic growth and employment		
F) Supporting retail	No impact.	0
G) Meeting housing needs	The policy seeks to deliver a high quality housing design, including provision of adequate space for storage, adaptability, private amenity space and a proportion of homes to meet lifetime homes standard and in accordance with car parking standards, a significant positive effect on the new housing stock of the district.	+3
H) Ensuring community health and wellbeing	Research by the RIBA in recent years highlighted that the UK is building some of the smallest houses in Europe. It noted the importance of providing flexibility of space within the home to adapt to changing needs, to provide space for family life and opportunities for children to study in private and most importantly that improved health and well-being can result from living in a well-designed home that provides sufficient space to function well and support privacy and social activity. This policy includes the delivery of a proportion of new homes to be built to lifetime homes standard, the inclusion of space for cycle storage and the impact this could have on local cycling activity and the need for adequate room for storage and movement within a property, a positive effect. The impact on public open space deriving from the requirement to provide 'private amenity space that reflects the size, location, floorspace, type and orientation of the property' could result in larger private gardens at the expense of public open space, an uncertain effect. However, overall the policy is considered to have a generally positive effect.	+2
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Cumulatively the policy will start a process by which more properties across the district are adaptable, though the policy will have no effect on the existing housing stock. The policy is therefore likely to have the indirect effect of allowing elderly or disabled people the opportunity to remain in their homes, should their needs change. The policy complements DM2 (high quality design) in the delivery of both a high quality urban realm with well-designed housing that meets the needs of local residents, as well as DM15 which sets minimum dwelling size space standards.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, as the policy requires a high standard of design which will affect the lifetime of a development. The requirement for adaptable properties will have a changing effect over time on the layout of a house, for example allowing buildings to be altered as circumstances change. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM15 Dwelling sizes

This policy seeks to address the provision of housing with sufficient internal space for the activities of family life. This policy sets minimum floorspace requirements for new housing development. It uses Homes and Communities Agency standards for affordable housing and seeks to apply it to all housing.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Increasing minimum dwelling sizes could reduce the number of dwellings per hectare that can be delivered on a particular site. A concern could be that this policy impacts on the number dwellings that can be delivered, and then the district would need to consider whether it allocating sufficient land for housing, which itself has implications for wildlife and landscape. However the proposed minimum standard represents overall a very marginal increase on only the smallest homes constructed (as most would be above the standard anyway). Therefore a neutral effect has been assumed.	0
B) Protection and promotion of a quality built and historic environment	Providing minimum space standards should ensure that the newest homes have a sufficient level of internal space. Properties which are built without sufficient space may be less desirable, and potentially have a shorter usable life – particularly as research indicates that older houses, typically have more space, and are therefore often more desirable. Homes with a shorter life may need to be demolished sooner. Such homes could not be considered to contribute to the promotion of a quality built environment. Therefore a small positive impact has been assumed.	+1
C) Mitigating the effects of climate change	Increasing the size of houses could also lead to increased carbon emissions, a negative effect. Larger and/or more rooms are likely to result in greater use of materials during construction and increased heating/energy costs during the lifetime of the building. Though, providing larger dwellings does provide opportunities to consider orientation as a way to increase passive solar gain, particularly through the use of larger windows. Properties that have suitable internal space are more desirable, and should have a longer life span – whilst those that do not meet the needs of people could have a shorter life, and could be demolished and replaced earlier. This has implications for carbon usage. Therefore, a small positive impact has been assumed.	+1
D) Safeguarding and minimising resource use	A potential negative outcome of implementing this policy is the effect it could have on the land take. Increasing minimum dwelling sizes could reduce the number of dwellings per hectare that can be delivered on a particular site. A concern could be that this policy impacts on the number dwellings that can be delivered, and then the district would need to consider whether it allocating more land for housing is required, which itself has implications for wildlife and landscape. However the proposed minimum standard represents overall a very marginal increase against only the smallest houses, and therefore an overall neutral effect is anticipated.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	This policy seeks to address the provision of housing with sufficient internal space for the activities of family life. This policy sets minimum floorspace requirements for new housing development, a positive effect.	+2
H) Ensuring community health	This policy seeks to address the provision of housing with sufficient internal space for the activities of family life. This can have a positive effect on educational achievement. RIBA research from recent years has indicated where children had no place for private	+2

and wellbeing	study in houses this could be linked to poor educational attainment.	
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Indirect effects may include the impact on land take, as increasing room sizes may reduce the number of dwellings that can be built on a plot. The policy, working in tandem with DM14 (design of housing) requiring sufficient private amenity space and Policy DM28 (green infrastructure in major development) which contains provisions for larger gardens could collectively add to the overall land take.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, the policy will set the size of rooms in a dwelling, which once built are a permanent feature. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM16 Town centre development

This policy encourages sustainable growth and regeneration of the district's principal settlements of Tiverton, Cullompton and Crediton. The policy focuses on promoting a variety of town centre uses, whilst resisting development that would harm the vitality and viability of defined primary shopping frontages. The policy has been updated from LP3 to remove Bampton town centre reflecting its proposed new settlement status as a village.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	No impact.	0
B) Protection and promotion of a quality built and historic environment	Development will be supported where it retains or enhances the town centre's historic character, a positive effect.	+2
C) Mitigating the effects of climate change	There are anticipated to be positive impacts of permitting a wide variety of uses within town centres. These are places where there are already a range of uses, facilities and services, which are already used to varying degrees. Promoting further and more varied uses could help regenerate the town centres, ensuring that residents continue to make use of their centralised locations, which can	+2

	be accessed by sustainable modes of transport, i.e. on foot, or via bus services.	
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	It is considered that providing some housing within town centres can positively contribute towards vitality. Mixed use town centres can have a wider economic benefit through developing the evening economy, whereby residents' access facilities such as restaurants/cinemas after traditional retail closing hours. The policy is therefore striking a balanced approach to maintaining vitality and viability, seeking to encourage a range of uses that support economic growth, an overall positive effect.	+2
F) Supporting retail	Development and change of use of ground floor premises to alternative uses will not be permitted where the primary retail role and character is undermined causing unacceptable fragmentation and isolation of remaining shops, a detrimental effect on the visual character and harm to the vitality and viability of the primary shopping area, a positive effect.	+2
G) Meeting housing needs	This policy may also increase the level of housing across the district. It is felt that providing some housing within town centres can positively contribute towards vitality, a positive effect.	+2
H) Ensuring community health and wellbeing	The town centres of Crediton and Cullompton are already designated as Air Quality Management Areas, whilst Tiverton is at risk of being given the same status. Whilst town centre living is likely to result in increased use of sustainable modes of transport, evidence suggests that residents will still wish to own a vehicle. More residents living in a town centre could have a negative impact on town centre air quality, but overall the concentration of commercial development in town centres is likely to reduce travel to out of centre retail and business premises and reduce the district's residual transport emissions. Other policies set criteria to control and reduce such negative effects. Overall a neutral effect is anticipated.	0
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	As a direct consequence the policy concentrates town centres uses within town centre boundaries, and therefore indirectly may make residential uses more likely outside of those boundaries. Synergistically this policy along with DM17 (development outside town centres) directs new employment development towards the town centres, i.e. the most sustainable location. The policy will need to be applied alongside DM8 (parking), given that driving to town centres is a popular means of travel, and any new developments will need to take account of parking levels, noting what existing provision is currently in place.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, but will be incremental in nature, and the option to revise town centre boundaries to permit different uses can be revisited in future should circumstances change. Medium to long term - change of use is an incremental process, and the concentration of town centre uses within the primary shopping areas and shopping frontages is likely to be more noticeable in the medium to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM17 Development outside town centres

The policy aims to guide development to the most sustainable locations, e.g. town centres, closer to other shops, services and public transport provision. This policy sets out a sequential approach to approving main town centre uses in the three towns of the district. Retail and leisure development over 500 square metres gross floorspace is required to be accompanied by an impact assessment. The policy has been updated from LP3 to remove Bampton town centre reflecting its new settlement status as a village.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	No impact.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The policy aims to have a positive impact on reducing carbon emissions. By applying a sequential approach which directs development towards town centres, and away from out of town sites, this should reduce the number of vehicle journeys to less sustainable locations. A positive impact is anticipated.	+2
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	The variation in impact is dependent on whether new development is located within the town centre (and largely has positive benefits), or as it moves to the edge of, or out of centre, those impacts become less pronounced or can have a negative effect. It is noted that the policy does not stop development taking place, and therefore should result in a positive impact on the amount of employment floorspace for the district. However, where edge-of-centre and out-of-centre land is marketed at a lower price than land within the town centre, there could be considerable pressure to be less than rigorous in applying the sequential test. The perceived benefit would be the creation of additional jobs. Whilst new employment development would create new posts, there could be negative effects on the viability of existing retail or other employment, particularly in town centres. The creation of jobs in one location could reduce jobs in another location, having no net effect on jobs, or degrading the town centre to the point that there is an overall reduction in employment. People may choose to work or shop in new developments if they are out of town, and	+2

	in doing so, visit town centres much less frequently. The policy aims to minimise such opportunities by applying the sequential approach and requiring an undertaking of an impact assessment which considers the effect on town centre vitality and viability. It will be the Council's responsibility to make balanced judgements based on evidence. An overall positive effect.	
F) Supporting retail	The variation in impact is dependent on whether new development is located within the town centre (and largely has positive benefits), or as it moves to the edge of, or out of centre, those impacts become less pronounced or can have a negative effect. It is noted that the policy does not stop development taking place, and therefore should result in a positive impact on the amount of employment floorspace for the district. However, where edge-of-centre and out-of-centre land is marketed at a lower price than land within the town centre, there could be considerable pressure to be less than rigorous in applying the sequential test. The perceived benefit would be the creation of additional jobs. Whilst new employment development would create new posts, there could be negative effects on the viability of existing retail or other employment, particularly in town centres. The creation of jobs in one location could reduce jobs in another location, having no net effect on jobs, or degrading the town centre to the point that there is an overall reduction in employment. People may choose to work or shop in new developments if they are out of town, and in doing so, visit town centres much less frequently. The policy aims to minimise such opportunities by applying the sequential approach and requiring an undertaking of an impact assessment which considers the effect on town centre vitality and viability. It will be the Council's responsibility to make balanced judgements based on evidence. An overall positive effect.	+2
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	No impact.	0
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	The policy directs development towards the town centres as the most sustainable locations. Indirect effects of this include the impact on traffic, which would be reduced if not having to access out of centre retail parks, instead making use of accessible sites in town centres with good public transport links. This policy complements Policy DM8 (parking) in this regard. The policy also works synergistically with DM19 (rural shopping) to direct larger retail towards town centres, rather than permit any development in the countryside or on the edge of settlements that may jeopardise town or village centre viability.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, once built these facilities are a permanent fixture of the townscape. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM18 Fronts of shops and business premises

This policy sets a standard for the design of shop fronts and business premises. The three towns of the district are all historic settlements, where the character of the high street is integral to their sense of place. Most of the town centre area for each of the three towns forms part of a conservation area. Over time the significance of a historic character can be diluted if unsympathetic shop and business fronts are permitted.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	No impact.	0
B) Protection and promotion of a quality built and historic environment	The policy will have a positive effect on listed buildings and the character of conservation areas. The historic nature of the district's market towns is an element in their tourist appeal. Ensuring the development of appropriate shop fronts should contribute towards maintaining a tourist attraction whilst also helping to deliver the priorities set out in conservation area appraisals. Shop fronts in areas of high architectural or historic value may require bespoke designs and construction in order to meet the criteria of the policy. It is possible that in some cases this could be the determining factor between an operation remaining open or being forced to close. However, taking a less stringent approach could result in the dilution of the character of a shopping area, which in itself could have a wider impact on the vitality of the entire centre. Given the positive and negative effects , an overall positive effect is still considered.	+2
C) Mitigating the effects of climate change	No impact.	0
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	The policy will have a positive effect on listed buildings and the character of conservation areas. The historic nature of the district's market towns is an element in their tourist appeal. Ensuring the development of appropriate shop fronts should contribute towards maintaining a tourist attraction whilst also helping to deliver the priorities set out in conservation area appraisals. Shop fronts in areas of high architectural or historic value may require bespoke designs and construction in order to meet the	+1

	criteria of the policy. It is possible that in some cases this could be the determining factor between an operation remaining open or being forced to close. However, taking a less stringent approach could result in the dilution of the character of a shopping area, which in itself could have a wider impact on the vitality of the entire centre in the long-term. Given the balance between positive and negative effects, an overall slight positive effect is still considered.	
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	No impact.	0
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Synergistically the policy support DM27 (heritage assets) in that the town centres of the three towns are all conservation areas. The quality of the retail environment in these centres is closely interlinked to their history as market towns and both policies would be applied together in order to preserve the character of the street scene.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, though the effects can be reversed much more simply (relatively), than making changes to buildings that have been constructed. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM19 Rural Shopping

This policy sets the criteria by which retail development can take place within villages, adjacent to villages, or elsewhere in the open countryside. The policy aims to direct rural shopping to the centre of villages, setting stricter criteria for proposals on the edge of settlements or in the countryside. The policy supporting text has been updated from LP3 to make reference to new permitted development rights.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	Landscape impacts could be negative if developing in the countryside. Criteria within the policy also seek development that would not have an unacceptable adverse impact on the character and appearance of the countryside, an overall neutral effect.	0

B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	The overall effect of the policy on sustainability is largely determined by the eventual location of development. Locating retail development within villages is likely to have a much less harmful impact in terms of reducing the need for the use of unsustainable modes of transport and promoting walking and cycling. Development at the edge of settlements or in the open countryside is potentially less sustainable, largely being accessed via the private car. The policy sets stricter criteria for rural development that is not within villages in order to minimise potential adverse impacts. An overall slight negative effect.	-1
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	The policy scores positively for increasing overall employment floorspace, particularly within villages, but this should be tempered against the impact this will have on existing retail offers. The impact on the availability of jobs within rural areas should be positive, given the criterion that the development should not impact on the viability of existing facilities.	+2
F) Supporting retail	The overall effect of the policy on sustainability is largely determined by the eventual location of development. Locating retail development within villages is likely to have a much less harmful impact in terms of encouraging vitality of rural centres. Development at the edge of settlements or in the open countryside is potentially less sustainable, largely being accessed via the risk of detrimental effect on existing village retail viability. Therefore the policy sets stricter criteria for rural development that is not within villages in order to minimise potential adverse impacts, an overall positive effect.	+2
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	No impact.	0
I) Delivering the necessary infrastructure	Criteria within the policy require development that would not lead to an unacceptable impact on the local road network, an overall neutral effect.	0

Secondary/cumulative/synergistic effects:	Indirectly the policy may reduce traffic in the open countryside or edge of settlement locations, instead directing uses to more central locations depending on the scale of the proposal. The policy supports DM/17 (development outside town centres) in directing development towards central locations with better public transport links.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, once development has been directed to a location it becomes a fixed feature of the landscape. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM20 Rural employment development

This policy sets out the criteria by which employment development can take place within the open countryside. The policy permits employment development, but seeks to ensure that it is appropriate in scale for its location and reduces adverse impacts.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	This policy sets out the criteria by which employment development can take place within the open countryside. Where a business requires a significant volume of vehicular traffic to visit the site, either through customers and/or deliveries this can result in unacceptable increases in emissions through the increased length of journeys required. Rises in pollutants can be a result, which could impact on biodiversity. Criteria within the policy state that there should not be an unacceptable adverse impact on the character and appearance of the countryside, an overall slight negative effect.	-1
B) Protection and promotion of a quality built and historic environment	The supporting text of the policy notes that there are various indirect consequences of employment development, such as security fencing, lighting, advertising material, open storage and vehicle parking. To ensure that new employment development contributes to a quality built environment, the policy requires that there is not an unacceptable adverse impact on character, and that the proposal is of an appropriate scale and use for its location. This is considered to be a positive impact.	+2
C) Mitigating the effects of climate change	Employment development that is located away from existing settlements can have negative sustainability impacts. Where a business requires a significant volume of vehicular traffic to visit the site, either through customers and/or deliveries this can result in unacceptable increases in emissions through the increased length of journeys required. Rises in pollutants can be a result. Furthermore, for the most rural locations, access to these locations via sustainable modes of transport becomes increasingly unlikely. However this policy has in place a number of criteria that set standards by which development would have to be in accordance. Transportation impacts are limited by criterion (a), whilst other impacts on character and appearance of the countryside are restricted by criterion (b). A slight negative impact has been assumed, given that the impacts can vary depending on the location of the development.	-1
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	This policy sets out the criteria by which employment development can take place within the open countryside supporting new build employment opportunities or the expansion of existing businesses, specifically where there is insufficient suitable sites or premises in the immediate area to meet the needs of the proposal, a positive effect for economic growth.	+2
F) Supporting	No impact.	0

retail		
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	No impact.	0
I) Delivering the necessary infrastructure	Employment development that is located away from existing settlements can have negative sustainability impacts. Where a business requires a significant volume of vehicular traffic to visit the site, either through customers and/or deliveries, this could result in a negative effect on road infrastructure. Criteria in the policy state that development should not lead to an unacceptable impact on the road network. Overall therefore, there could be some negative impacts on road capacity for certain developments, dependent on their location – therefore a slight negative impact has been assumed..	-1

Secondary/cumulative/synergistic effects:	Indirectly this policy may lead to a greater number of businesses operating within the countryside. When combined with Policy DM11 (conversion of rural buildings) together this could result in more people both working and potentially living in the countryside. This has an effect on the delivery of services, e.g. waste collection that would need to access new employment sites, increasing the size of collection rounds, increasing carbon emissions and potentially increasing costs for service delivery agencies.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, once development has been directed to a location it becomes a fixed feature of the landscape. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM21 Protection of employment land

This policy sets out Mid Devon's approach to protecting allocated and existing employment sites. The SA Scoping Report highlighted the loss of employment land as being a particularly importance sustainability issue for the district. Out-commuting to larger centres such as Exeter and Taunton is an existing concern, which has negative impacts on transport emissions, pollution and climate change. Employment sites have been allocated in sustainable locations within the Local Plan, to meet an identified shortfall across the district. Therefore, the protection of these sites, in the immediate term is a priority.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural	No impact.	0

environment		
B) Protection and promotion of a quality built and historic environment	In the short term the policy could mean that sites allocated for development remain in their current state. For greenfield sites this is not an issue, but for brownfield sites, particularly where there are dilapidated buildings, the immediate result could be a negative impact on the quality of the overall street scene. For this reason, a minor negative impact has been assumed.	-1
C) Mitigating the effects of climate change	Without the policy it is possible that should these sites be given over to other uses, most likely to housing, out-commuting would likely increase. This would have negative impact on the transportation emissions and climate change, and reduce the district's ability to meet its own needs. The application of this policy will therefore be likely to have a positive effect in terms of mitigating climate change.	+2
D) Safeguarding and minimising resource use	Without a safeguarding policy there could be increased pressure for non-allocated sites to come forward for employment, which could likely be on greenfield land. The policy has a positive effect in respect of minimising the loss of greenfield land.	+2
E) Promoting economic growth and employment	This policy sets out Mid Devon's approach to protecting allocated and existing employment sites, a positive effect for business by ensuring the district has a range of available sites of different sizes. Criteria within the policy allow for alternative uses where there is a suitable range of suitable and available employment sites in the local area, there is no commercial interest in the site which has been marketed for 18 months, a sequential viability test has been applied following unsuccessful marketing, testing mixed use and non-employment uses. Overall, it is considered that the policy will have a positive impact on economic growth.	+2
F) Supporting retail	No impact.	0
G) Meeting housing needs	The policy seeks to protect employment land from the change of use to other use. As housing is a likely alternative use for such sites this policy has the potential to provide a limited amount of residential development should other uses prove unlikely to come forward in the long term. However, there needs to be consideration of the appropriateness of the location for housing, as some employment land will be in a location where it is acceptable, but perhaps, housing would not be. Overall, there are possible positive and negative impacts on housing, so a neutral impact has been assumed.	0
H) Ensuring community health and wellbeing	No impact.	0
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	The redevelopment of existing employment sites is covered by the policy which states this will be permitted where there are not strong economic reasons. Mid Devon has an undersupply of small employment allocations and such sites may be protected from development for alternative uses in line with this policy. In the short term this may result in certain sites in towns not being redeveloped immediately, and potentially being vacant. Vacant sites can attract vandalism, can deteriorate and affect the feel of an area, therefore there are circumstances where a

	negative indirect impact could be felt. Though a long-term view on the availability of employment land across the district would be taken. Any proposals to redevelop the site would also be considered in light of Policy DM2 (high quality design) as it may be inappropriate to redevelop a site in a predominantly industrial area for residential use as this would result in a poor level of amenity for potential residents.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Temporary in that an employment site may be protected for up to 5 years, but after this period it may be considered for other uses. Short to medium term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM22 Agricultural development

This policy permits agricultural development where is supports activity on a farming enterprise and is sensitive in its design and location to limit any adverse effects.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The scale of some modern agricultural facilities and their impact on the surrounding landscape could have a negative effect. Criteria within the policy however require development to be sensitively located to limit any adverse effects on residents and are well designed respecting the character and appearance of the area. Development should also not have an unacceptable impact on the environment. Given the proposed mitigation measures an overall neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	The policy requires development to be sensitively located, be well-designed and respectful of character and appearance of the area. Therefore a positive impact is anticipated.	+2
C) Mitigating the effects of climate change	The increased carbon emissions created at all stages of constructed a new building (i.e. at manufacture of materials, transportation, on-site energy usage), a slight negative effect.	-1
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth	Through being allowed to upgrade to more modern buildings and/or expand their farming enterprise, potentially creating more jobs in the process, the policy will have a positive effect for rural enterprise.	+2

and employment		
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	Pollution, air quality and transportation impacts on rural roads are also a negative impact, but these have been limited through criteria in the policy. An overall neutral effect is considered.	0
I) Delivering the necessary infrastructure	Agricultural development in the countryside can put additional pressure on road infrastructure, a potentially negative effect. Criteria within the policy seek development that will not have an unacceptable traffic impact on the local road network, so the overall effect is considered to be neutral.	0

Secondary/cumulative/synergistic effects:	The cumulative development of large modern agricultural buildings can alter a landscape. The policy seeks to limit such cumulative impact by requiring development to respect the character and appearance of an area. Together with Policy DM11 (conversion of rural buildings) the policy could result in some agricultural buildings being developed that could later be converted to other uses, however they would need to demonstrate that they were of substantial and permanent construction and make a positive contribution to an area's character.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, once development has been directed to a location it becomes a fixed feature of the landscape. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM23 Equestrian development

This policy permits equestrian related development within the countryside, providing that it is well integrated with the local landscape, through appropriate location, scale, design and materials. Commercial or large domestic developments are also required to demonstrate that they do not result in an unacceptable increase in traffic.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	This policy permits equestrian related buildings within the countryside which are often located in fields away from other development leading to a negative effect on the landscape. The policy has been written so that any development must be well integrated with the surroundings, and to take account of factors such as location, scale, design and materials, in order to reduce	-1

	any harmful effects of building within the countryside, an overall slight negative effect is anticipated.	
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	This policy permits equestrian related development within the countryside with the carbon dioxide emissions related to construction (from extraction/manufacture of materials, transportation and on-site emissions), being a slight negative effect.	-1
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	This policy permits equestrian related development within the countryside with the growth in employment related developments, providing opportunities for economic growth and potentially tourism, a positive effect.	+2
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	Potential negative impacts include pollution from vehicles accessing the site at construction and during operation use is also a concern, though that will be dependent on the scale of the development. Whilst some schemes could potentially have a negative effect, overall a neutral effect has been considered, typically because equestrian developments are largely very small scale.	0
I) Delivering the necessary infrastructure	There is the possibility of the potential negative impacts on road safety from riders using local roads, where the bridleway network coverage is poor, a slight negative effect.	-1

Secondary/cumulative/synergistic effects:	Where there are a number of equestrian developments in an area this could cumulatively change the nature of the landscape, particularly in the case of smaller scale domestic size developments.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, once development has been directed to a location it becomes a fixed feature of the landscape. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM24 Tourism and leisure development

This policy sets out the circumstances in which tourist or leisure facility developments are acceptable. Development is permitted inside or adjacent to settlements, and only permitted in the countryside where proposals meet a criterion based approach.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Developing within the open countryside could impact negatively on the landscape, however to a degree this is mitigated by the policy requirement to respect local character and appearance. Overall a neutral effect is anticipated given the mitigation.	0
B) Protection and promotion of a quality built and historic environment	Development is required to take account of character and appearance, thereby ensuring the promotion of a quality built environment. A sequential approach is taken, whereby development is first directed to nearby settlements, in order to ensure unnecessary building in countryside locations.	0
C) Mitigating the effects of climate change	Negative impacts are linked to the transportation and carbon emissions associated with locating new development away from existing settlements. The policy applies a stricter control of tourist development away from settlements, only agreeing proposals where there is not an unacceptable impact on the road network. Despite this provision, any development away from settlements will involve a greater level of carbon emissions from the longer journeys required to access the site. This is in addition to the carbon emitted during the manufacture of materials and construction phases.	-2
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	In terms of employment, it is noted that the policy supports the development of tourist, visitor and leisure facilities, both in/adjacent to settlements, or where justified, within the open countryside, thereby supporting an increase in employment floorspace in rural areas, and overall across the district. This will also result in an increase in the number of tourist bedspaces provided and thereby should positively impact on tourist numbers across the district, an overall positive effect.	+2
F) Supporting retail	Town centres may also have a mixed outcome from the policy, which will largely be determined by whether the development is located in such a position as to draw focus towards itself and away from an existing centre, thereby impacting on vitality and viability. Given the positive and negative effects an overall neutral effect is considered.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	Access to public transport and local services will depend on the location of the development. If located in or adjacent to a settlement this could have a positive impact on public transport provision, through additional number of tourists/visitors accessing the facility. However, any development in the open countryside is considerably less likely to be close to public transport provision, and unless it is significant in size and attraction, is unlikely to lead to alterations to existing networks.	0

	Given the positive and negative effects an overall neutral effect is considered.	
I) Delivering the necessary infrastructure	Tourism and leisure facilities located in the countryside could increase the amount of traffic on unsuitable roads, a negative effect. Criteria with the policy require proposals to justify the countryside location, avoiding unacceptable traffic impact on the local road network. Development will also be expected to demonstrate that the need is not being met by existing provision within nearby settlements, an overall slight negative effect.	-1

Secondary/cumulative/synergistic effects:	The policy could work positively with DM11 (conversion of rural buildings) to convert appropriate buildings in the countryside to tourist uses. These are lower impact in terms of sustainability than residential developments, such as not needing access to the same level of services, and generating lower carbon emissions because they tend to be less frequently used during autumn/winter, when more fuel would be needed to heat them if lived in all year round. Indirect effects could include the boost to rural incomes, particularly in cases where farm owners wish to diversify their activities, and research has often shown that tourism is traditionally an area considered.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, once development has been directed to a location it becomes a fixed feature of the landscape. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM25 Community facilities

This policy covers a wide range of community facilities including shops, pubs, post offices, village halls and places of worship. It aims to provide new community facilities where they are accessible and provide a benefit to local residents, whilst only permitting the loss of existing facilities where it can be proven that the facility is not economically viable.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	No impact.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0

C) Mitigating the effects of climate change	No impact.	0
D) Safeguarding and minimising resource use	The policy supports proposals for the redevelopment of existing community facilities that enable them to modernise, remain viable and continue to be retained for the benefit of the community will be supported. The reuse of existing buildings is a positive effect towards minimising resources.	+2
E) Promoting economic growth and employment	New community facilities in rural areas could increase retail and employment opportunities, a slight positive effect.	+1
F) Supporting retail	New shops in rural areas will increase retail and employment opportunities, a positive effect. New development could be harmful to the viability of existing facilities by acting in competition, e.g. a new edge of village retail offer could reduce footfall in the existing centre. However, such proposals will be judged against this policy, and others on employment set out in the Local Plan, a negative effect on existing retail facilities in towns and smaller settlements. The policy does not support proposals involving the loss of community facilities such as local shops and other important local services to be permitted where this would damage the settlements ability to meet its day to day needs. Overall, a slight positive impact is anticipated.	+1
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	The appraisal highlights the positive effects this has in terms of delivering social objectives. In particular the provision of new community facilities in a settlement has positive effects on the viability of settlements. For instance the greater level of services in a settlement, the higher likelihood that it will be served by public transport. Such facilities include schools and colleges, thereby increasing access to education and training. The policy does not support proposals involving the loss of community facilities such as local shops, public houses, allotments, cultural and recreational facilities and other important local services to be permitted where this would damage the settlements ability to meet its day to day needs.	+2
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Retaining community facilities within settlements can increase the vitality and viability of a town/village. Where community facilities do not exist or are lost an indirect effect is likely to take place on the level of local traffic. Where people do not have access to local community facilities they may access others in different settlements; typically they will do this by using a car. The presence of community facilities in a settlement is likely to reduce traffic in that location.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, once facilities are built they are a permanent feature of the landscape. Once community facilities are lost, such changes are unlikely to be reversed. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM26 Protection of recreational land and buildings

This policy provides protection for recreational land and buildings against being used for alternative development. It provides a criterion based approach under which open space, sports or recreational buildings and land can only be redeveloped in certain circumstances. Redevelopment is limited to situations where the existing use is surplus, or where there will be replacement provision in a suitable location, or where the new development is for better sports or recreational provision.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	No impact.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	No impact.	0
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	The most likely alternative use for such sites is housing development. However, the plan will allocate sufficient housing to meet local need, so it is not felt that protecting recreational land and buildings will have a detrimental effect on housing provision.	0
H) Ensuring community health and wellbeing	There are positive outcomes in terms of the implications for public open space, in that its loss is severely restricted and can only take place where it is surplus or is to be replaced by equivalent or better provision. Development for alternative sports and recreational provision, where the need outweighs the loss. However because the policy does not result in a net increase of public open space, only a slight positive effect is considered.	+1

I) Delivering the necessary infrastructure	Protecting sites of public open space, sports and recreational land is a positive impact, as these are critical elements of local infrastructure.	+3

Secondary/cumulative/synergistic effects:	Indirectly, retaining open space, sports and recreational land and buildings is likely to have a positive impact on health and wellbeing by providing places for residents to take part in sport or other outdoor activities. When considered alongside policies within the Local Plan that allocate land for new housing, thereby creating additional demand, and putting pressure on existing facilities; their protection is therefore important to meet the needs of future generations.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, once the loss has taken place this is not likely to be reversible. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM27 Development affecting heritage assets

This policy aims to preserve or enhance the heritage of the district, covering all heritage assets and their settings including; listed buildings, conservation areas, historic parks and gardens, archaeological sites and other locally important features. Heritage assets are a vital element of the district's landscape, contributing towards the character of the area, and once lost are gone forever. This policy therefore aims to preserve these elements, to save them for the benefit of future generations.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	No impact.	0
B) Protection and promotion of a quality built and historic environment	The policy scores positively against enhancing or improving the understanding of the district's heritage assets. Criteria within the policy include a presumption in favour of preservation in situ, requiring development proposals likely to affect heritage assets and their settings the opportunities to enhance them, only approving proposals that would be likely to substantially harm heritage assets and their setting if substantial public benefits outweigh the harm requirements of paragraph 133 of the NPPF, where development proposals would lead to less than substantial harm, that harm will be weighed against any public benefit, including securing optimum viable use and requiring developers to make a systematic assessment of the impact on setting as set down in the guidance from English Heritage, a significant positive effect.	+3

C) Mitigating the effects of climate change	No impact.	0
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	Local heritage and character is important for tourism, which whilst not playing as large a role as in other parts of the county, is an area that the district wishes to develop. The protection of local heritage ensures this will have a positive effect on efforts to growth the local tourism industry. Many of the town centres of the district have a historic core, and the preservation of their character is therefore a priority, a positive effect.	+2
F) Supporting retail	The sustainability impacts on town centres also scores a mixed outcome. Many of the town centres of the district have a historic core, and the preservation of their character is therefore a priority. However, for retailers in these areas this places limitations on changes they can make to the appearance of their facility, and can add a cost burden to and development they wish to carry out. Given the positive and negative effects an overall neutral effect is considered.	0
G) Meeting housing needs	Requiring development proposals likely to affect heritage assets and their settings, including new buildings, alterations, extensions, changes of use and demolitions, to consider their significance, character, setting and local distinctiveness, and the opportunities to enhance them may in a limited number of cases add an additional financial cost to development. A minor negative impact has been assumed as a result.	-1
H) Ensuring community health and wellbeing	No impact.	0
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	The policy provides protection from harm to heritage assets, even if that harm is indirect. Providing appropriate protection to heritage assets should result in no incremental or cumulative loss of historic character or gradual fragmentation of conservation areas across the district.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, provides protection for heritage assets, as once they are lost they are gone forever. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM28 Green infrastructure in major development

This policy aims to ensure positive gains for biodiversity, public open space and other elements of green infrastructure are delivered as part of major development schemes. Allowances are made within the policy for alternative arrangements when viability or feasibility is a concern.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The requirement for a net gain in biodiversity where warranted, means that though biodiversity may be affected by development, overall there will be a positive effect, for example through establishing greater links between wildlife networks or increasing habitat areas. Criteria within the policy seek new green infrastructure such as the creation of native woodland where possible. Landscape quality and character should be positively impacted by the requirement to develop green corridors, new woodland and public open space.	+2
B) Protection and promotion of a quality built and historic environment	Inclusion of green infrastructure within a development is considered to add positively to its quality.	+2
C) Mitigating the effects of climate change	Green infrastructure should be incorporated into major sites as flood and water resource management a positive effect on flood risk. Green infrastructure can also act to mitigate the effects of climate change by acting as a 'carbon sink', thereby helping to reduce the overall CO2 levels in the atmosphere, a positive effect.	+2
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	Integrating green infrastructure within major development does entail an element of additional cost for developers, though this is not a new concept and developers already expect to incorporate green space. It is possible that in some cases this additional requirement may be the element that determines the viability of a particular site. Where viability is cited as a concern, the elements of a scheme that historically have been reduced or omitted have tended to be affordable housing or employment development. However the policy does set out options for providing off-site provision where the criteria would render a development undeliverable. Therefore the negative impacts should be considerably reduced and in many cases off-site provision may mitigate them entirely, an overall slight negative effect.	-1
F) Supporting retail	No impact.	0
G) Meeting housing needs	Integrating green infrastructure within major development does entail an element of additional cost for developers, though this is not a new concept and developers already expect to incorporate green space. It is possible that in some cases this additional requirement may be the element that determines the viability of a particular site. Where viability is cited as a concern, the elements of a scheme that historically have been reduced or omitted have tended to be affordable housing or employment development. However the policy does set out options for providing off-site provision where the criteria would render a development undeliverable. Therefore the negative impacts should be considerably reduced and in many cases off-site provision may mitigate them entirely, an overall slight negative effect.	-1

H) Ensuring community health and wellbeing	The policy should also result in an increase in walking and cycling opportunities, through the creation and/or improvements to public rights of way, a positive effect. There could also be an overall reduction in pollution, e.g. through inclusion of sound buffers to reduce noise or by sustainable urban drainage systems bringing about natural improvements to water quality, a further positive effect.	+2
I) Delivering the necessary infrastructure	This policy aims to ensure positive gains for biodiversity, public open space and other elements of green infrastructure are delivered as part of major development schemes, a significant positive effect. Allowances are made within the policy for alternative arrangements when viability or feasibility is a concern.	+3

Secondary/cumulative/synergistic effects:	Synergistically the policy works alongside a number of other policies within the Local Plan, impacting positively on district wide sustainability issues. In particular it works jointly with Policy DM2 (high quality design) to provide flood attentuation measures and walking and cycling opportunities.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent, the policy sets the level of green infrastructure that is delivered per major development proposal, which will be a permanent feature. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM29 Protected landscapes

This policy affirms the value of protected landscapes and the need to safeguard them from inappropriate development. Strict controls are in place to ensure that proposals for development within or affecting these areas take account of the character, appearance, setting and special qualities of the landscape. The policy requires, where possible, these features and biodiversity to be enhanced as a result of the development proposal.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	Protected landscapes, such as the Blackdown Hills AONB, are a distinctive and highly valued element that contributes to the character of the district. Development proposals within or affecting the Blackdown Hills Area of Outstanding Natural beauty, Dartmoor National Park, Exmoor National Park and the North Devon Biosphere Reserve must demonstrate that the a) cultural heritage and the character, appearance, setting and other special qualities of the landscape will be conserved or, where possible enhanced and b) biodiversity will be conserved and enhanced where possible through improved linking of habitats, appropriate landscaping and habitat creation. Against the sustainability framework this policy scores significantly positively for the effect it will have on priority habitats, protected/priority species, wildlife networks and landscape quality and character.	+3
B) Protection and	There are also positive effects in terms of cultural heritage, which the policy supports. For example the Dartmoor landscape	+2

promotion of a quality built and historic environment	contains many examples of mining heritage that may be visible from long distances, and the implementation of this policy should ensure that the special qualities of these landscapes, in terms of cultural heritage, are conserved or enhanced.	
C) Mitigating the effects of climate change	The policy is likely to restrict opportunities for new renewable/low energy developments within or affecting those landscapes, a negative effect.	-2
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	None of the landscapes referenced in the policy text are in locations where strategic policy focuses development, therefore the effects on economic sustainability are not a major issue, a neutral effect. In contributing towards the district's character and appearance, these landscapes also are a primary factor in the area's attraction for tourism, a positive effect.	+2
F) Supporting retail	No impact.	0
G) Meeting housing needs	The policy is likely to constrain some opportunities for new housing within or affecting those landscapes, a minor negative effect.	-1
H) Ensuring community health and wellbeing	No impact.	0
I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	Indirectly this policy should have a positive impact on tourism, as the character, appearance and setting of these landscapes is directly linked to their appeal as visitor destinations. Synergistically the policy will work alongside a number of others that require consideration of the character and appearance of the landscape, e.g. Policies DM2 (high quality design), DM5 (renewable and low carbon energy), DM11 (conversion of rural buildings), DM19 (rural shopping), DM17 (development outside town centres), DM22 (agricultural development), DM23 (equestrian development) and DM24 (tourism and leisure development). This is likely to reduce opportunities for new housing or renewable/low energy developments within or affecting those landscapes.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent; it provides protection for the special qualities of designated landscapes, which could be permanently affected by inappropriate development. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM30 Other protected sites

This policy requires development proposals to balance their benefits against any adverse impacts on protected sites. It aims to provide a degree of protection for important sites that do not have the level of security given to designations such as national parks or AONBs.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Where development proposals would lead to an individual or cumulative adverse impact on Special Areas of Conservation, Sites of Special Scientific Interest, ancient woodland, Regionally Important Geological Sites, County Wildlife Sites and Local Nature Reserves, the Council will balance the overall benefits of the proposal against the impact. Impacts on habitats, biodiversity and landscapes are noted as being positive because the criteria are strong enough to afford sufficient protection. In most cases a less harmful location for development could be identified, i.e. where most development is already provided for, such as the towns of the district, or elsewhere in the countryside such as on a farm. Overall the impact of the policy is considered to be positive.	+2
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	No impact.	0
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	No impact.	0

I) Delivering the necessary infrastructure	No impact.	0

Secondary/cumulative/synergistic effects:	The cumulative effect of the policy is likely to be noted in directing some development to other locations that are less harmful to protected sites. The scope of the policy covers individual and cumulative adverse impacts on these sites and these are assessed in terms of the significance of the site. The policy provides greater protection for the most significant sites, and cumulative impacts could be felt on those sites of lesser significance. However any development proposals would need to meet the criteria of the policy, which does include demonstrating that other, less harmful locations are not available. The policy recognises that where development proposals would lead to an individual or cumulative impact on Natura 2000 sites, planning permission will be refused unless the proposal complies with criteria a) & b) and the fundamental integrity of the features of the Natura 2000 site would not be affected.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permanent; the policy provides protection and appropriate mitigation for protected sites, which could be permanently affected by development. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Policy DM31 Planning enforcement

This policy sets out the district's approach to taking enforcement action. It confirms that investigations will be undertaken and action taken where it is deemed appropriate. The policy and supporting text notes that unauthorised development can have a detrimental impact on the local environment and can be a source of social tension.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	Without effective enforcement action inappropriate development can have an adverse impact on the local environment, biodiversity and landscape character. Such development could affect feel of a landscape, thereby reducing the qualities that make them special. Failure to investigate such developments is likely to encourage further transgressions. This policy sets out the district's approach to taking enforcement action, a positive effect.	+2
B) Protection and promotion of a quality built and historic	Without effective enforcement action inappropriate development can have an adverse impact on the historic environment through the detrimental impact on heritage assets such as listed buildings, conservation areas and historic parks and gardens. Such development could affect the setting of a heritage asset, thereby reducing the qualities that make them special. Failure to investigate such developments is likely to encourage further transgressions. This policy sets out the district's approach to taking	+2

environment	enforcement action, a positive effect.	
C) Mitigating the effects of climate change	Without effective enforcement action inappropriate development can have an adverse impact on climate change and flood risk, by avoiding requirements that may have been put in place as part of any planning consent. This policy sets out the district's approach to taking enforcement action, a positive effect.	+2
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	No impact.	0
H) Ensuring community health and wellbeing	Without effective enforcement action inappropriate development can have an adverse impact on community health and well-being for example through inappropriately located development and lack of services. This policy sets out the district's approach to taking enforcement action, a positive effect.	+2
I) Delivering the necessary infrastructure	Without effective enforcement action inappropriate development can have an adverse impact on infrastructure provision, for example through inappropriately located development placing unacceptable pressure on the local highways network. This policy sets out the district's approach to taking enforcement action, a positive effect.	+2

Secondary/cumulative/synergistic effects:	Cumulatively the impact of failing to tackle inappropriate development could result in a loss of public confidence in the planning system, and could mean an opportunistic increase in attempts at unauthorised development. The policy has indirect implications for the service provision of planning enforcement, requiring a budget contribution that ensures the local authority adheres to the text of the policy in 'investigating unauthorised development' and 'acting proportionately'. A sufficient level of resources will be required to ensure this is undertaken in accordance with the policy.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The effects of the policy may have both temporary and permanent effects. Planning enforcement may result in unauthorised development being regularised, either through granting of temporary or permanent planning permission; or may result in inappropriate development being addressed through enforcement action, which could mean developments that are currently part of the landscape or streetscape, being permanently removed. Immediate to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Rural 'exception sites' for affordable housing

The policy allows for the development of sites for predominantly affordable housing to meet proven local need in rural areas subject to certain criteria. The policy has been updated from a version contained within the Allocations and Infrastructure Development Plan Document to allow the inclusion of a proportion of market housing within exception sites. The NPPF paragraph 54 allows for the potential for exception sites to contain some market housing to facilitate the provision of significant additional affordable housing to meet local needs. The proportion of market housing will be expected to be less than the provision of affordable housing and the market housing will be at the lowest level to ensure that the development is deliverable.

Sustainability objective	Commentary	Impact
A) Protection of the natural environment	The policy may result in more homes being built on the edge of settlements which cumulatively could impact on landscape, a negative effect. Criteria within the policy note that exception sites are expected to adjoin a settlement and take into account the visual impact and other relevant planning issues, positive effect. Given the potential for cumulative impact against mitigation measures an overall neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate change	No impact.	0
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	No impact.	0
F) Supporting retail	No impact.	0
G) Meeting housing needs	The policy allows for the development of sites for predominantly affordable housing to meet proven local need in rural areas subject to criteria, a positive effect. The NPPF paragraph 54 allows for the potential for exception sites to contain some market housing to facilitate the provision of significant additional affordable housing to meet local needs. Criteria within the policy ensure that the proportion of affordable housing will always be larger than the provision of market housing on exception sites and developers will be expected to submit evidence to demonstrate the level of market housing proposed is the lowest level needed to deliver significant affordable housing. Evidence of local need will also be required in relation to exception sites.	+3
H) Ensuring community health	Exception sites allow affordable housing to come forward in rural locations where other developments would not normally be permitted. Such schemes allow people to remain living in settlements where they have a strong local connection. This is	+1

and wellbeing	considered to be a positive impact on local community well-being.	
I) Delivering the necessary infrastructure	The policy may result in more homes being built on the edge of settlements which cumulatively could impact on local infrastructure including traffic, schools and health services. However, such affordable housing schemes are generally exempt from contributions towards infrastructure, so there may be a negative impact as a result of housing growth taking place without the necessary accompanying growth in rural infrastructure.	-2

Secondary/cumulative/synergistic effects:	The policy may result in more homes being built on the edge of settlements which cumulatively could impact on the landscape and local infrastructure. Any proposals would be determined with regard to DM/2 (high quality design) and also Mid Devon's Landscape Character Assessment.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development coming forward through this exception site policy is considered permanent. Short to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Gypsies and travellers

Planning applications for gypsy and traveller pitches including for travelling showpeople will be permitted subject to certain criteria. The policy has been updated from the version included within the Allocations and Infrastructure Development Plan Document to clarify sites will be permitted subject to suitable on-site facilities, consideration of environmental quality and that sites with employment or storage elements should not have a harmful impact on local amenities.

Sustainability objective	**Commentary**	**Impact**
A) Protection of the natural environment	The location of gypsy and traveller sites in the open countryside could impact upon landscape sensitivity and local biodiversity, a negative effect. Development proposals should be considered against all policies within the Plan including those on landscape protection and biodiversity. Sites with associated employment or storage elements will be permitted where the location will not have a harmful impact on the local amenity or the environment. Given the negative impact on the natural environment but availability of mitigation measures a slight negative effect is considered.	-1
B) Protection and promotion of a quality built and historic environment	No impact.	0
C) Mitigating the effects of climate	Sites should be located where they can access services within the use of a car. Though the use of cars for such purposes cannot be ruled out, the possibility of the use of sustainable modes of transport is considered to be a minor positive impact on carbon	+1

change	emissions.	
D) Safeguarding and minimising resource use	No impact.	0
E) Promoting economic growth and employment	Sites with associated employment or storage will be permitted where there is a specific justification subject to harmful impact on local amenity or the local environment, a positive effect towards supporting local businesses.	+1
F) Supporting retail	No impact.	0
G) Meeting housing needs	The policy supports proposals for gypsy and traveller pitches including travelling showpeople where a need is identified. Occupancy will be limited to those who met the Governments published definition of gypsies and travellers, a positive effect.	+2
H) Ensuring community health and wellbeing	Criteria within the policy seek proposals that provide suitable on-site facilities including space for children's play, consideration of environmental quality for residents, a positive effect.	+2
I) Delivering the necessary infrastructure	The policy may result in residential sites being built in the open countryside which cumulatively could impact on local road infrastructure. A minor negative impact, given the generally small scale of typical sites in the district.	-1

Secondary/cumulative/synergistic effects:	The provision of gypsy and traveller sites in rural locations will increase the number of people living in the countryside, this has effects in terms of carbon emissions and services reaching those dwellings
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Permissions can be either temporary or permanent. Immediate to long term.
Spatial extent: (District wide / local)	District wide.

Summary of Recommendations

1. No recommendations following SA.

Mid Devon
DISTRICT COUNCIL

Local Plan Review

Sustainability Appraisal Scoping Report July 2013

Contents

1 Introduction.....2

2 Relevant plans and programmes 3

3 Baseline information about Mid Devon.....7

4 Sustainability issues and problems 17

5 A framework to assess sustainability.....18

6 Consultation 20

7 Appendix: Reviewed plans and programmes (full list).....21

1 Introduction

1.1 Mid Devon is beginning the process of preparing a new Local Plan for the district. The document will set the levels and distribution of development and strategic policies for the period 2011-2031. The document will also set out infrastructure requirements to deliver the strategic objectives and will also state the policies by which development management decisions will be made when determining planning applications. It is anticipated that the process of preparing the plan will take two years, with the document ready for adoption in 2015. Once adopted, the single Local Plan will replace the three existing parts of the current plan:

- Core Strategy (adopted 2007)
- Allocations and Infrastructure Development Plan Document (adopted 2010)
- Local Plan Part 3: Development Management policies (adoption anticipated in autumn 2013)

1.2 In order to be in accordance with EU and UK legislation, any plan must be subject to a Sustainability Appraisal/Strategic Environmental Assessment (SA/SEA). SA/SEA (or SA for short) assists in promoting sustainable development through integrating sustainability considerations into plan making. It is an iterative, ongoing process and integral to plan making. The process helps to consider the effects of the plan (and the effect without the plan) on the environment, on people and on the economy. It helps planning authorities to consider the merit of a variety of options to help determine the most sustainable policy decisions.

1.3 The SA will highlight potential negative impacts of a plan, thereby providing the opportunities for these effects to be avoided or mitigated. However, the SA cannot ensure that development will be absolutely sustainable in all its aspects. Where harmful effects are noted, the SA can help to demonstrate how they can be mitigated. It is possible that in some cases development which is in some respects less sustainable may still have to take place, perhaps where the social and/or economic benefits outweigh environmental impact.

1.4 This scoping report is the first stage in the preparation of an SA. It will be developed and updated as the Local Plan is prepared and is broken down into five elements. First, there is an analysis of other plans or programmes that may impact on the Local Plan and need to be considered. Second, baseline information about Mid Devon is collated to highlight previous trends based on national and local data. Thirdly, a summary of sustainability issues or problems specific to Mid Devon has been provided based on the analysis undertaken from examining other plans and the baseline data. Fourth, a framework is provided by which the options within the Local Plan can be analysed for their sustainability impacts. The final element of the scoping report is a consultation process, offering interested organisations and members of the public the opportunity to comment on the sustainability considerations noted within the report.

2 Relevant plans and programmes

2.1 The first stage of undertaking a sustainability appraisal involves identifying and taking account of other relevant policies, plans and sustainability objectives. The Local Plan will not be a document developed in isolation – its content will be influenced by a large number of factors and policies defined by EU or UK legislation, national policies and other plans and strategies at a local level. Understanding the relationship between the Local Plan and these policies is important as it will influence the options considered in preparation of the plan. Information on these relationships will reveal where there are shared objectives or inconsistencies and constraints to be addressed.

2.2 The reviewed plans and strategies have been grouped into theme areas. Many of the themes will cut across each other, however to permit an analysis they have be collated under particular headings. Only the conclusions from the review of relevant plans are contained below; the full review of plans and strategies can be found within the appendix.

Air quality

2.3 All the air quality-related policies/strategies reviewed emphasise the need to reduce carbon emissions as a key action to mitigate the effects of climate change. Reducing emissions is also a requirement in areas that suffer from poor air quality, such as in Crediton and Cullompton. Reviewed policies also encourage increasing the use of low carbon vehicles as part of a strategy to reduce emissions. These messages must be clearly reflected within the new Local Plan. The document should ensure that new development does not unacceptably contribute to poorer air quality, and that opportunities for reducing emissions are incorporated. New development should encourage the use of sustainable modes of transport, such as walking, cycling or the use of public transport. New development should also help to promote the market for low carbon vehicles by ensuring the delivery of electric vehicle charging infrastructure, or other latest technological infrastructure needed for low emission transportation.

Biodiversity and green infrastructure

2.4 The biodioversity and green infrastructure plans and strategies reviewed have at heart the need to conserve and enhance biodiversity. Policies should avoid the deterioration of habitats, and look to preserve, restore and recreate priority habitats, with no net loss in priority habitats. Development should provide net gains in biodiversity where possible, balancing the economic and social needs of development with the objectives of bio- and geo-diversity conservation. Policies should also give consideration to biodiversity enhancing development. A holistic approach to the provision of playing fields should be taken, considering all public and private landowners.

Climate change mitigation and energy

2.5 The UK is committed to achieving targets in reducing greenhouse gas emissions in order to tackle climate change, and development has a significant part to play to help achieve these targets. Planning needs to minimise vulnerability to the impacts of climate change, and support the delivery of renewable and low carbon energy development. Improving the energy

efficiency of the fabric of buildings, particularly by encouraging low or zero carbon energy sources will limit CO_2 emissions.

Community and wellbeing

2.6 The reviewed plans and strategies set out the importance of delivering an integrated approach to new development. Building mixed inclusive communities, around a strong neighbourhood centre, with a mixture of housing, economic uses, community uses and services is a priority. Access to services, the creation of safe neighbourhoods and the availability of local greenspace and quality education and leisure facilities for young people are vital in the creation of healthy, inclusive communities. The provision of accessible, adaptable properties also allows older residents or those with disabilities to remain in their communities, close to family and friends, rather than having to move as their needs change. Residents should be able to influence decisions that affect them.

Economy and economic development

2.7 The planning system should support the development of strong, sustainable and balanced economic growth. Opportunities for meeting the needs of local and inward investment should be met by facilitating the growth of local businesses, both urban and rural, and providing sufficient land for employment. There should be sustained investment in business and transport infrastructure to improve connectivity. The regeneration of the market towns of the district should be supported with a particular aim to reduce the number of empty shops.

Historic environment

2.8 The planning system should set out a positive strategy for the conservation and protection of the historic environment, considering the value it plays in delivering sustainable, distinctive places that are enjoyed by local people. A balance needs to be struck where the priorities of maintaining and enhancing the built environment are balanced against the district's development needs. The impact on heritage assets of development should be proportionally considered in relation to their significance, with the most important nationally significant assets being given the utmost protection.

Housing

2.9 Nationally the country has not been building enough homes to house its population, and therefore significantly boosting the supply of homes is a priority. The proportion of the population of people above retirement age has increased and there is a need to provide appropriate housing in response. Providing for an ageing population or people with disabilities may need to be addressed through the delivery of homes that can be adapted as peoples circumstances change, or through the delivery of extra care housing. A wide variety of house types should be provided, across a range of tenures to meet the needs of the population. In response to the fact that house prices are nearly ten times local earnings, there is a need to provide affordable housing to address long social housing waiting lists and others with a housing need. Such issues are also acutely felt in some of the more rural locations of the district, where house prices may be even higher, and will need to be addressed through affordable housing delivery to meet an identified need. Provision for the needs of gypsies and travellers should be made planned for which seeks to balance their locational, economic and

social needs with the protection of amenity and the environment. There is a need for modern homes to be environmentally sustainable, and meet the consumer demands of the population, including provision of sufficient storage space and private outdoor space.

Infrastructure

2.10 The reviewed plans and strategies highlight the importance of delivering infrastructure to meet the needs of existing and new communities. The Government places great importance on the delivery of the following infrastructure as part of ensuring sustainable economic development: transportation, flood protection, communications, research, energy and waste. Community facilities and schools are important infrastructural elements that are required to meet the needs of local communities as part of the delivery of sustainable development.

Land

2.11 Soil is a fundamental natural resource that has often been degraded by human action. Soils should be protected and enhanced. Planning should consider allocating or developing land with the least environmental value, prioritising lower quality land. Consideration of the soil quality of best and most versatile agricultural land, and the need to remediate contaminated land should be a planning consideration. When considering development, the use of land should be optimised across a site to ensure the efficient use of building footprints whilst setting a density of development appropriate to local circumstances.

Landscape

2.12 Devon has a unique and valued landscape, which also contributes towards the tourism attraction of the county. Mid Devon has borders that are adjacent or in close proximity to two national parks, whilst the Blackdown Hills Area of Outstanding Natural Beauty crosses the east part of the district. Planning policies should protect valued landscapes, offering protection and enhancement of the most valued such as national parks and AONBs. The protection of the landscape needs to be balanced against the challenge of mitigating the effects of climate change through the transition to a low carbon future, particularly achieved through the development of renewables technologies, which are often located in rural areas.

Minerals

2.13 There needs to be a sufficient supply of minerals to ensure the long-term ability to deliver infrastructure and development. The need for a supply of minerals needs to be balanced with the priority of protecting the environment. Planning for minerals extraction does not fall within the remit of Mid Devon District Council, being instead undertaken by Devon County Council. However, the consideration of the environmental impact of materials used in buildings and the desire to promote locally sourced materials is a district issue, as is the effect on local communities who are in close proximity to mineral workings.

Rural areas

2.14 The population in rural areas has grown at a greater rate than urban areas in the last decade. Rural businesses make a substantial contribution to the economy and should be supported to grow. Agriculture remains an industry that has faced many challenges in recent decades and such enterprises should be supported to diversify in order to benefit the rural economy. Rural

areas experience social issues such as poor access to services and facilities, whilst the growth of their economies may be hampered by poorer broadband speeds.

Transport

2.15 Reducing carbon emissions produced as a result of transportation is a national priority. This can be achieved by increasing opportunities for the use of sustainable modes of transport, such as public transport, walking and cycling; through the delivery of opportunities to increase the use of electric vehicles and improving the connections between various modes of transportation; improving the condition of the local transport network and protecting existing transportation assets. Ensuring safe and sustainable transport options are available to communities is also a priority.

Waste

2.16 National waste priorities are to protect human health and the environment whilst ensuring the delivery of sustainable waste management. Reducing the carbon footprint of waste will also contribute towards tackling climate change. New development should contribute to sustainable waste management, through the application of the waste hierarchy where disposal is the last resort, instead prioritising re-use, recycling or recovery.

Water

2.17 Managing flood risk and the effects of climate change is a key national and local priority, particularly as Mid Devon has suffered serious flooding in the past. There is also growing pressure on water resources and a need to improve resource efficiency. In particular new housing and commercial development should incorporate measures to improve water efficiency and reduce surface water run-off which can contribute to flooding. Water bodies should be protected from the effects of pollution, and there should be no reduction in their quality or status.

3 Baseline information about Mid Devon

3.1 The next stage of undertaking a sustainability appraisal focuses on collecting baseline information about Mid Devon. The information collected provides a basis for predicting and monitoring effects and helping to identify sustainability problems. The information collected is drawn from a mixture of sources from national plans and strategies and combined with local monitoring data.

3.2 Much of the information represents generic data about the district, rather than specifically generated information in relation to the development of the Local Plan. Some of it will have been relevant in the production of previous local development documents, whilst other data will have been updated more recently. Some information may not be up to date, but may be the most recently available. The information provided covers a broad range of environmental, social and economic matters which collectively understood help to assess sustainability.

Location

3.3 Mid Devon is an inland area in the south west of England, lying roughly equidistant between the Bristol and English Channel coasts. The significant urban areas of Exeter (population 117,800) and Taunton (63,000) are just beyond the southern and eastern boundaries of the district respectively. Major east-west transportation routes run through the district, including the M5, A361, A30 and the Great Western Mainline Railway.

Physical characteristics (including landscape)

3.4 The district of Mid Devon covers an area of 353 square miles (914 sq. km) in the heartland of Devon. It lies between Dartmoor, Exmoor and the Blackdown Hills. From the centre of the district, the north and south coasts of Devon are each about 30 miles away. The majority of Mid Devon's settlements are nestled within the folds of the landscape, with many small historic settlements containing thatched cottages and ancient churches. Tiverton is the main town within the district, with the three smaller market towns of Cullompton, Crediton and Bampton.

3.5 The Mid Devon district forms the heart of the Devon countryside, linked to the south coast by the River Exe with its valley and surroundings. The intricate course of the River Exe is the most defining landscape feature in Mid Devon, providing a continuous thread flowing from the northern extremities of the district down to the south near Thorverton. To the east the Blackdown Hills have a unique geology and provide an often isolated and valued distinctive rural landscape.

3.6 The Culm Valley to the east is a low lying flat prosperous agricultural area, with good soil fertility. The north and northwest of the district is a high flattish landscape with a rather unsheltered windswept appearance, formed by the Culm Measures, so called for its underlying thin bed of coal known locally as 'Culm'. The farming hinterland to the north of Crediton, often referred to as the Mid Devon farming belt, has all the typical elements that make up the distinctive Devon landscape, with its varied patchwork of irregular shaped fields with green pastures.

Biodiversity and green infrastructure

3.7 The varied nature of Devon's geology and landform has led to a considerable range of biodiversity. There are various protected species found in Mid Devon, such as woodlark, bats and dormice. In comparison with the rest of Devon, Mid Devon has relatively little land designated as being of national importance and no designed or candidate European sites. Within Mid Devon there are 12 Sites of Special Scientific Interest (SSSI), three local nature reserves and two nature reserves managed by Devon Wildlife Trust. Mid Devon has over 8 sq. km. of ancient woodland. The district supports a range of important wildlife including over 200 County Wildlife Sites and Regionally Important Geological Sites.

3.8 Changes in wildlife populations and habitat have occurred throughout the last century and show a general trend of decline. The main threats to biodiversity include environmental pollution, land use change, fragmentation and invasive species introduction. These pressures are likely to continue and biodiversity may also be affected by climate change and recreational pressure. Hedgerow removal and unsympathetic conservation of rural buildings can impact on important species identified in the Devon Biodiversity Action Plan.

3.9 In particular the RSPB's State of Nature Report (June 2013) stated that 60% of species on which they hold data are in decline, whilst 31% have declined strongly. Half of the species assessed have also shown strong changes in abundance or distributing, indicating that recent environmental changes are having a dramatic impact on the nature of the UK's land and seas. In particular species with specific habitat requirements are faring worse that generalist species that are better able to adapt to a changing environment. Action needs to be taken to save nature for its intrinsic value and for the benefits it brings to us that are essential for well-being and prosperity.

3.10 Natura 2000 sites, which are hierarchically the most important sites for biodiversity, are protected under European legislation. Natura 2000 sites include Special Areas of Conservation (SACs) designated for species and habitats and Special Protected Areas (SPAs) designated for birds. Whilst there are no Natura 2000 sites within Mid Devon, there are six within 5km of the district's boundary. The six sites include:

- Hare's Down, Knowstone and Rackenford Moors (North Devon)
- Exmoor Heaths (North Devon and West Somerset)
- Exmoor and Quantock Oak Woodlands (North Devon and West Somerset)
- Holme Moor and Clean Moor (Taunton Deane)
- Quants (Taunton Deane)
- South Dartmoor Woods (Teignbridge)

3.11 The Hare's Down, Knowstone and Rackenford Moors site is considered to be at greatest risk from development, due to its location on the A361 and proximity to the Mid Devon boundary. The A361 is the main route into North Devon from the M5 motorway, providing a vital tourism link as well as a certain amount of commuter and shopping traffic in either direction. Natural England has advised that any development that encourages through-traffic may impact on the SAC.

3.12 There are many other elements that form part of the district's green infrastructure. These include 476 miles of Public Rights of Way and two regional walking routes (Two Moors Way in the west and Exe Valley Way from North to South). These routes are used recreationally by walkers, cyclists and horse-riders, but many rights of way provide short enough connections through and between towns and villages that they are realistic choices for people travelling to and from work and school.

Climate change mitigation and energy

3.13 Forecasting the future impact of climate change is particularly challenging, though there is extensive scientific evidence that the world's climate is changing. The UK Government has stated that if the global average temperature rises more than 2^{o}C above pre-industrial levels, significant negative impacts of climate change will be more likely and the cost of managing them will rise sharply. To have a 50% chance of keeping climate change to within 2^{o}C of pre-industrial levels, global greenhouse gas emissions need to peak before 2020 and then decline steeply. Evidence suggests at present emissions are continuing to soar. On 10 May 2013, concentrations of CO^2 in the atmosphere passed 400 parts per million, the highest level in 50 years of data collection, and a peak not estimated to have been experienced for three-five million years (the Pliocene period, a time when the arctic was ice-free and sea levels were 40 metres higher than today).

3.14 There are many risks associated with increasing climate change. These include threats to agriculture as a result of higher demand for water resources, reduction in productivity in farming or forestry land as a result of drought or conversely as a result of flooding. Businesses are likely to be effected by increased risk of flooding, competition for water, energy and materials and the disruption of transport networks and communication links. The flooding and resultant disruption to the Great Western Railway line near Stoke Canon in December 2012 highlights the potential impact on the region. The natural environment could be affected resulting in increased concentrations of pollutants in low water levels or reduced river flows damaging freshwater habitats and other ecosystem services; warmer rivers, lakes and seas impacting on biodiversity; flooding impacting on key habitats; ocean acidification affecting species and habitats and changes in seasonal events.

3.15 These effects will be experienced at a time when national energy reserves are declining. Much existing energy infrastructure is in the process of closing as it reaches the end of its operational life, whilst domestic fossil reserves of oil and gas are declining. The amount of spare electricity capacity in the system could fall from 14% (in 2012) to 4% by 2015/16 (Statutory Security of Supply Report, 2012).

3.16 To ensure there is sufficient energy to meet the UK's energy needs, and to mitigate the impacts of climate change there is a need to increase our reliance on low carbon technology. In the last few years this has resulted in increased delivery of renewable electricity generation in Mid Devon, typically in the form of large scale solar photovoltaic farms and to a lesser extent onshore wind turbines. To date there has been less development of renewable heat. Mid Devon has also been able to ensure the delivery of solar PV cells on the roofs of all local authority owned housing.

3.17 Whilst Government pays subsidies in the form of tariffs for renewable energy and maintains a positive approach to moving to low carbon energy sources, pressure for such developments within Mid Devon is likely to increase – particularly given the district's location (i.e. annually more sun in the south, and more wind as the area is exposed to the prevailing south westerly winds). However, this has implications for conflicts that may arise as a result of landscape impacts, particularly given the proximity to national parks and the Blackdown Hills AONB. Historically, large-scale renewable energy developments have often been vocally opposed by local communities.

3.18 Mitigating the effects of climate change will also require the use of lower carbon resources in the construction industry, particularly as part of the development of houses and other buildings. Buildings will need to use fewer resources through the use of materials with a lower lifecycle carbon use, whilst simultaneously increasing energy and resource efficiency. Building regulations have been gradually amended to improve the energy efficiency of homes which will have affected the carbon output of recent new builds nationally. However, within Mid Devon, the delivery of homes which meet the higher categories of the Code for Sustainable Homes has not been a priority. This trend may start to be reversed as a result of new policies within the Local Plan Part 3 requiring all new major housing development to meet code level 3, rising to code level 5 by 2016.

Community and wellbeing

3.19 The health of people in Mid Devon is generally better than the England average. However, life expectancy is 4.9 years lower for men in the most deprived areas of Mid Devon than in the least deprived areas. Over the last 10 years all-cause mortality rates have fallen. About 16.9% of Year 6 children are classified as obese, whilst levels of teenage pregnancy and smoking in pregnancy are lower than the England average. Priorities for Mid Devon include addressing healthy weight in childhood, cardiovascular skin disease, skin cancer prevention, alcohol use and smoking.

3.20 Despite the impact of the recession, incidents of recorded crime have continued to fall year on year since 2007/08. Furthermore, the area is one of the lowest for recorded crime within Devon and Cornwall. Should the economic downturn continue it is unclear whether this pattern will be able to continue. Social deprivation, however, has increased across the district since 2007, with approximately 1,900 children living in poverty (Mid Devon Health Profile, 2012). Deprivation is highest in Tiverton, Cullompton and in some of the more remote rural areas.

Economy and employment

3.21 The majority of Mid Devon's employment falls within the service sector, which includes occupations where knowledge and time are offered to improve productivity. Examples include transport and distribution, retail and services such as accountants or building surveyors. This sector accounts for 76.7% of Mid Devon employment (Economic Trends Report, August 2012).

3.22 There are low levels of inward commuting and a strong 'pull' from neighbouring urban areas, especially Exeter. Forthcoming data releases from the 2011 Census will provide up-to-date information about travel-to-work patterns. The available information from the Annual

Population Survey (2008) estimates that of the people working in Mid Devon, only 25% commute in from outside the district, while only 57% of Mid Devon's working residents stay in Mid Devon for work.

3.23 The district profile produced for the Local Economic Assessment (2012) found that there is a high level of self-employment within Mid Devon, and the district is above the Devon average for business density (number of businesses per working age person) and business start-ups. While school-level attainment is above average for the county, this does not translate to a highly skilled resident workforce, implying that high-attaining school leavers are not staying in Mid Devon.

3.24 The Council commissioned a Retail Study in 2012, to assess both demand and the capacity of the local catchment areas to support different sorts of retail growth. The report highlighted that Mid Devon's market towns are in a vulnerable position, similar to other small-medium sized towns across the country. The study identifies common trends, such as national retailers consolidating their businesses in larger regional centres, while internet shopping also takes trade away from town centre shops. Retail forecasts predict weak growth in spending, resulting in possible reductions in town centre retail space, with these effects potentially being most acutely felt in Crediton and Cullompton. Out-of-centre retail development may be most attractive to developers due to lower land values but may harm the existing town centres. Regeneration of the town centres, particularly as Tiverton is in receipt of government regeneration funding as part of the 'Portas Pilot' programme, is a priority, but one that faces significant challenges.

3.25 Tourism also represents a small but important sector within the district. Devon is a popular destination for domestic tourism, though traditionally Mid Devon has not been a significant recipient of tourism spend as visitors bypass the district en route to other parts of the county, particularly those areas closer to the coast. Previously, tourism development focused on the small scale provision of visitor accommodation, often on farms that were diversifying their activities. A Mid Devon Peer Challenge undertaken in early 2013 highlighted tourism as an economic area on which the district could capitalise. Further detail on the type of tourism offer that should be pursued will be presented by the forthcoming Tourism Study. It is likely this will prioritise modest sized developments seeking to capitalise on existing assets, such as the district's location and rural nature, including its proximity to two national parks.

Historic environment

3.26 Mid Devon is a district with a rich historic and cultural heritage. There is a wealth of historic buildings and features throughout the district, with over 2680 listings of buildings, bridges and milestones. The district has three historic parks and gardens of national importance – Knightshayes, Bridwell Park and Shobrooke Park, with 16 of local value. The area also has 50 conservation areas and 49 scheduled ancient monuments, including castles, roman forts, stone crosses, bowl barrows, a henge, abbey, ring ditch, iron age earthworks, camps, a Romano-British villa, Neolithic causewayed enclosure and a hillfort. In addition there are a wide range of archaeological remains which are not scheduled.

3.27 The four main towns of the district all have a particular historic importance. Tiverton has its origins in a ford across the Rivers Exe and Lowman and has an attractive historic centre and a rich legacy of buildings of all periods. Crediton is a historic market town with medieval burgage plots that can still be discerned in the south side of the High Street. Cullompton is an old town with two grade I listed properties and some ninety grade II. Bampton was formerly a market town and has the mound of a former medieval motte and bailey castle.

3.28 However, whilst the heritage of the district is critical to local character, there is not comprehensive coverage of documents that provide an aide to protection. Of the 50 conservation areas, only 12 have conservation area appraisals and four have conservation management plans. Whilst the four main towns and a number of the larger villages are all covered, other villages and smaller settlements within the district have no coverage. Production of additional appraisals has slowed in recent years, with only two new CAAs adopted since 2008 (another is currently in draft). Cullompton has an Article 4 direction in place, which offers a degree of protection over and above that of the conservation area designation. Plans to put in place a similar directive in Bradninch were discussed but have not been adopted. There are currently 22 heritage assets in Mid Devon that are considered by English Heritage to be at risk of degradation for various reasons. The Heritage at Risk Register identified three conservation areas (Bow, Cullompton and Tiverton), two buildings and 17 scheduled monuments at risk.

3.29 There are also potential conflicts between the protection of heritage assets and mitigating the impact of climate change. In particular this is played out where home owners wish to install renewable energy features, such as solar PV arrays on roofs in a conservation area or on a listed building. Such developments may not positively contribute to local character or may reduce the significance of the heritage value of a building. This represents a potential conflict of sustainability objectives.

Land

3.30 Building on previously developed land, “brownfield land”, avoids the need to use greenfield land for new housing. In recent years, Mid Devon has developed a high proportion of new housing and employment on brownfield sites, with totals of 59% of new or converted housing and 57% of new employment development in 2011/12. This trend is not likely to continue as previously developed land is a finite resource, which is relatively scarce in a rural setting such as Mid Devon. Government policy encourages the effective use of brownfield land, provided that it is not of high environmental value; however this approach is less strict than previous national policy. Conversely, national policy now provides less support for the long-term protection of employment land for development for alternative uses. This could mean existing brownfield land being used for housing, potentially reducing the overall amount of greenfield that needs to be allocated.

3.31 Government guidance also states that planning should consider the economic and other benefits of the best and most versatile agricultural land. A national grading system has been in place since the 1960s which classifies the quality of agricultural land based on factors based on

soil, climate and site. At the time of original mapping the breakdown of grades within Mid Devon was as follows:

Grade	Percentage land coverage
1	3.48%
2	11.01%
3	64.44%
4	19.86%
5	0.05%
Non-agricultural	0.28%
Urban	0.89%

Source: MAFF (1966)

3.32 This mapping, produced by Central Government, has not been updated on a district-wide basis since it was originally commissioned. However, it is unlikely to have changed significantly despite the growth in urban areas in the last forty years and it highlights the very low levels of the best quality agricultural land available within the district. Any loss of this resource would need robust justification.

Minerals

3.33 Responsibility for minerals planning is a function of Devon County Council. However, Mid Devon is the setting for a number of locations of mineral extraction. Strategic mineral sites producing minerals of national importance or making a significant contribution to delivering sub-regional aggregates include the winning of limestone at Westleigh.

Population and housing

3.34 The release of data from the 2011 Census has shed new light on population trends in Mid Devon. In combination with other data sources, this helps to build a picture of changing household composition and long-term needs. The population according to the census is 77,750, an increase of approximately 11% upon the 2001 figure, a rate of growth that has risen faster than the rest of Devon, the South West and England. The median age of Mid Devon residents has also increased, from 41 to 44 reflecting both regional and national trends of a population that is living longer. The number of households within the district has also increased by 13% within the last ten years, reflecting not only population growth, but changing societal demographics such as older people continuing to live independently in their own homes for longer and the growth in single parent households. Average household size has stayed consistent at 2.4 over the last decade.

3.35 House prices in Mid Devon are higher than the averages for Devon, the South West and England and Wales. While house prices have fallen slightly since the economic downturn, average 2011 were still 89% higher than they were in 2001 and there are signs that the ratio of house prices to earnings is rising again, with fewer people now in full-time employment.

3.36 Affordability remains a critical issue, and with the Mid Devon population having risen 11% between 2001 and 2011, there is a mismatch between the overall availability and the demand for affordable housing. The Mid Devon Local Housing Needs and Demand Survey 2011

indicated a need for 335 additional affordable dwellings each year to address the backlog of unmet need over the last 10 years. Over that 10 year period, total housing completions in Mid Devon averaged 349 dwellings per annum, the majority of these being market rather than affordable dwellings. Existing plans allocate sufficient land to meet the strategic target of 6,800 dwellings up to the year 2026, but other factors such as mortgage and developer finance availability will have had an impact on housing delivery since 2009.

3.37 The Council intends to commission a new Strategic Housing Market Assessment in partnership with some of our neighbouring district councils. This will provide definitive, up-to-date information on the level of housing need and demand across the Exeter Housing Market Area. Local planning authorities are required to cooperate with each other on strategic planning matters.

Resources

3.38 Energy is a crucial consideration in the functioning of the economy, and one area of concern is the future of non-renewable sources of energy, particularly oil. There has been much discussion about the notion of 'peak oil' in recent decades, the theory being that production of oil will peak in coming decades, with demand outstripping supply. Whilst there is academic disagreement on the reality of the peak oil theory, there is growing consensus that the age of cheap oil is coming to an end. Declining production of existing older oil fields will exacerbate production problems. As a result, more than two thirds of current crude oil production capacity may need to be replaced by 2030, simply to prevent production from falling. This is likely to be extremely challenging, and will likely result in necessary demand reduction and sourcing alternative sources of energy supply. Local effects of peak oil will include increased costs for fuel, with significant rises already having taken place, affecting motor vehicle users, but also passengers on public transport facing higher fare costs. As the government seeks to deliver a balanced future energy supply, there is likely to be greater desire to deliver renewable energy developments, with pressure particularly felt in rural areas for onshore wind and solar farms.

3.39 There is also uncertainty over the future supply of phosphorus, which is an essential ingredient in fertilisers, and plays a critical role in contributing to modern agricultural production. Some researchers have predicted that phosphorus reserves are expected to be completely depleted within 50-100 years, though this is not universally agreed. Such reductions will have a significant impact on farming productivity, land use and food supply.

Rural areas

3.40 National government statistics classify Mid Devon as a 'Rural-80' based on the location of the local population. This statistic refers to the fact that over 80% of the population are resident in rural settlements (including those with urban areas with between 10,000 and 30,000 population regarded as 'larger market towns'). Classifying Mid Devon as a 'Rural-80' local authority puts it in a category of the most rural local authorities within the UK.

3.41 Rural businesses are a key element of the local economy. There is a growing trend for individuals to set up their own businesses, particularly in rural areas where areas such as Mid Devon can provide a high quality of life and where transport costs and distances can encourage home-working. Broadband access and speeds can be a key issue for rural-based businesses. A

programme to connect Devon and Somerset with superfast broadband is underway which will result in speeds of at least 24Mbps to at least of 85% of homes and businesses by 2015. However, many rural areas currently receive less than 2Mbps at present, which may hinder the start up or expansion of rural businesses.

3.42 Access to services is also an issue for rural areas. Statistics for the whole of Devon show a decrease in the number of households within good transport access to key services or work. Levels of public transport providing services to 55 villages in Mid Devon have shown a decrease since 2006. In particular the number of daily services to these settlements has shown a steady decline across this period.

Transport and air quality

3.43 As a rural area, Mid Devon has a high dependency on the car, particularly as public transport provision and coverage is far from extensive, and has shown signs of contracting. These factors are reflected in the level of car ownership, which has increased at both national and local levels. The average household in Mid Devon now owns 1.47 cars, as opposed to 1.33 at the time of the previous census. The percentage of households owning 2, 3 and 4 or more cars has all increased, whilst the share of those who do not own a car has fallen. In particular, the ratio of cars owned per household in Mid Devon has continued to grow at a consistent rate whilst growth in the national level has shown signs of levelling off. High levels of car ownership have not been affected by planning policies to restrict parking provision in recent developments. This has led to inappropriate or anti-social parking, rather than a reduction in car ownership. Future developments should make suitable provision for parking in order to reflect the rural nature of the district and levels of ownership. Neither does it appear that higher fuel costs have had an effect on car ownership, though high levels of ownership do not always translate into high levels of usage.

3.44 High levels of car ownership and hotspots of poor local road infrastructure have impacted on local air quality. Both Cullompton and Crediton were designed as Air Quality Management Areas in 2006 and 2004 respectively. Principal actions to address the excessive levels of Nitrogen Dioxide and particulates in the air include the development of the Crediton Link Road and two relief roads within Cullompton. Work to provide the Crediton Link Road has already commenced, however to date there has been no progress on new roads in Cullompton. Funding is being provided by Central Government to undertake improvements to both junctions 27 and 28 of the M5, however this may only reduce some of the congestion experienced at the Cullompton turn-off.

Waste

3.45 National policy on waste prioritises reduction, re-use or recycling in order to prevent waste going to landfill. Local authorities will experience increasing costs as a result of waste going to landfill, which will need to be reduced by using alternative methods of waste management, particularly given the severe pressures that are on Council finances as a result of Central Government funding cuts. There are also implications for climate change as a result of how waste is managed. In many cases carbon acts as a good proxy for the overall environmental

impacts of waste: generally speaking, the higher up the waste hierarchy waste is treated, the smaller the greenhouse gas impacts.

Water

3.46 Mid Devon has suffered serious flooding in the past, and the risk of flooding is likely to increase in the future as a result of climate change. Forward planning must take account of this risk to ensure that new development is sustainable. Winter rainfall is predicted to increase by 15-30% by the 2080s as a result of climate change, with a concomitant 20% rise in peak river flow. Impermeable surfaces of buildings, roads and pavements limit infiltration and increase the volume and rate of surface water runoff. Future development may increase the area of impermeable surfaces unless a sustainable approach to water management is adopted that promotes sustainable urban drainage and improved water efficiency within buildings. A new Strategic Flood Risk Assessment will need to be commissioned once options for future development have been produced, which will provide advice on the potential likelihood of flooding based on the location of sites proposed.

4 Sustainability issues and problems

4.1 The next stage in the appraisal process involves the identification of any sustainability problems that relate to Mid Devon. These issues will have been highlighted as part of the review of relevant plans and programmes and the baseline data for the district set out earlier in this document. The initial list may expand further as a result of consultations undertaken as the Local Plan is prepared. The issues identified will also inform the sustainability objectives which form the basis of the framework to appraise the Local Plan strategy and policies as set out in the next section of this document.

4.2 This scoping report has highlighted the following sustainability issues within Mid Devon:

- Small areas of social deprivation within Tiverton, Cullompton and some of the remote rural areas (including high levels of child poverty)
- Large population growth within the last decade and demographic household change leading to the need for new housing, particularly affordable housing given the high ratio between prices and local earnings
- Houses have not previously been constructed of a sufficient size to meet the needs of the modern family
- Access to services and facilities for rural communities has worsened and may continue to do so
- Biodiversity levels continuing to fall, often dramatically for some species
- Low levels of the best quality grade 1 agricultural land across the district
- Pressure to develop primarily on greenfield sites as fewer brownfield sites remain or require costly remediation
- The need to avoid disposal of waste, instead prioritising re-use, recycling or reduction
- Rich historic environment across the district, though some heritage assets at risk
- Climate change objectives can conflict with the conservation of the area's historic environment, particularly in the installation of renewables technologies that may impact on heritage assets
- Pressure for the installation of renewable energy developments to meet energy shortage
- Increased risk of flooding as a result of climate change
- Low delivery of low or zero carbon homes to date
- High car dependency across the district, with levels of car ownership having grown and continuing to grow
- Traffic congestion and poor air quality within Crediton and Cullompton
- Low levels of inward commuting but strong out-commuting, especially to Exeter and the potential loss of employment within Mid Devon
- Low retention of high-attaining school leavers
- Rural self-employment or small business start-up is a growing sector, however this may be constrained by poor broadband speeds
- Declining town centre health with town centre with regeneration likely to be affected by any new out-of-centre development

5 A framework to assess sustainability

5.1 A framework is used to understand the sustainability effects of the Local Plan as it is being developed. This framework is central to the process of sustainability appraisal. A framework has been developed consisting of sustainability objectives, each of which includes a number of elements against which a policy will be appraised. The framework includes all those factors highlighted through this report that will affect the sustainability of the Local Plan.

5.2 The framework below represents a more simplified approach than that used in previous Mid Devon SAs. This approach is considered to offer greater flexibility as the new Local Plan will contain both high level strategic policies, site allocations and detailed policies to guide development management decisions. This new framework can be applied to all these policies equally.

5.3 The sustainability objectives proposed are distinct from the objectives of the Local Plan, though they may in some cases overlap with them. They will provide a way of checking whether the Local Plan objectives are the best possible ones for sustainability and will test the social, environmental and economic effects of the plan. The indicators are not fixed at this stage, and can be amended, if required, in response to input received as a result of the scoping consultation exercise.

Sustainability objective	**Elements covered**
A) Protection of the natural environment	Habitats and biodiversity; flora and fauna; protected species; landscape
B) Protection and promotion of a quality built environment	Heritage assets, including listed buildings, conservation areas, scheduled ancient monuments, registered parks and gardens, locally listed assets, archaeology; design and quality of development
C) Mitigating the effects of climate change	Reduced flood risk; promotion of low carbon or renewable energy; reductions in carbon emissions; walking and cycling provision; low carbon buildings
D) Safeguarding and minimising resource use	Quality of soils, including contaminated land; water quality, including consideration of water framework directive objectives; minimisation of waste; impact on best and most versatile agricultural land
E) Promoting economic growth and employment	Increasing jobs; reducing out-commuting; skills training; growth of rural businesses; tourism provision

F) Supporting retail	Safeguarding the vitality and viability of town centres; relationship between new development and town centres; supporting viability of shopping facilities in villages
G) Meeting housing needs	Supply of housing; housing mix; house size; housing affordability; appropriate housing density to location; proximity to services and facilities
H) Ensuring community health and wellbeing	Community support for proposals; access to open space and recreation; limiting air, noise and light pollution to levels that do not damage human health or natural systems; integrated and sustainable forms of travel including walking, cycling and public transport; social deprivation; safe and secure environments
I) Delivering the necessary infrastructure	Roads and transportation; schools; health services; community facilities; green infrastructure; telecommunications

5.4 In order to consider the impact of the Local Plan against the sustainability objectives, a scoring system is proposed to be used. A score will be provided against each of the objectives to highlight a policy or proposal's sustainability impacts. Collectively, this will allow consideration of a policy's overall impact and permit comparison with other policies or proposals. Where negative impacts are highlighted, it will also permit proposals or policies to be modified and then rescored in order to determine whether their sustainability impacts have been made more positive.

5.5 The use of a scoring system with a range from +3 to -3 will highlight the scale of any potential impact. This offers more scope than the approach taken in the most recent SA of the Local Plan Part 3 where only a positive, negative, zero or indeterminate outcome could be used – a system which could not easily differentiate between a marginal or significant impact.

5.6 The following table sets out the scoring system that will be used:

Score	**Rationale**
+3	The policy/proposal will have a significant positive contribution towards achieving the objective
+2	The policy/proposal will have a positive impact in contributing towards achieving the objective
+1	The policy/proposal will have a minor positive impact in contributing towards achieving

	the objective
0	The policy/proposal will have no impact or will have some positive and some negative impacts thereby having a balanced effect in contributing towards achieving the objective
-1	The policy/proposal will have a minor negative impact in contributing towards achieving the objective
-2	The policy/proposal will have a negative impact in contributing towards achieving the objective
-3	The policy/proposal will have a significant negative contribution towards achieving the objective

5.7 In addition to the scoring process, a summary of information will be provided. This summary will describe the impact against each of the sustainability objectives, setting out the nature of the impact, how each is experienced and whether any of the impacts noted are offset by other effects of the policy.

6 Consultation

6.1 To meet the requirements of the SEA Directive, the Council must seek the views of the three statutory environmental consultation bodies – Natural England, the Environment Agency and English Heritage. They have the opportunity to comment on the scope and level of detail of the environmental information contained within this report. Local communities and other bodies are also being consulted on the content of this report.

7 Appendix: Reviewed plans and programmes (full list)

Air quality	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
The 2008 Climate Change Act	The Climate Change Act sets statutory emissions reduction targets to at least 80% below the level of net UK emissions of targeted greenhouse gases in 1990.
The Carbon Plan: Delivering our Low Carbon Future (HM Government, 2011)	The Carbon Plan sets out how the UK will achieve decarbonisation within the framework of energy policy. Within the next 10 years the plan requires the development and deployment of new technologies that will be needed to halve emissions in the 2020s. Domestic transport emissions account for nearly a quarter of UK emissions; to achieve target vehicles will need to run on ultra-low emission technologies such as electric batteries, hydrogen fuel cells and plug-in hybrid technology. These changes will bring environmental benefits including improved local air quality. Encouraging the use of public transport, cycling or walking will boost the reduction in emissions.
The Air Quality Strategy for England, Scotland, Wales and Northern Ireland – Volume 2 (DEFRA, 2011)	The Air Quality Strategy points to certain pollutants where national objectives are in some cases being met, and others not. Pollutants described include: lead, benzene, 1,3-butadiene, carbon monoxide, particulate matter, nitrogen dioxide, ozone, sulphur dioxide and polycyclic aromatic hydrocarbons. Levels for many of these emissions are closely related to transport use, which planning policies will need to consider means to reduce those reaching unacceptable levels.
The Air Quality (Standards) Regulations 2010	The Air Quality (Standards) Regulations transpose into English legislation the requirements of EU directives on air quality and cleaner air. It sets air quality standards for key pollutants and requires the UK to demonstrate how the standards will be achieved and maintained when compliance is breached. Particular attention is given to reducing particulate matter, a pollutant associated with transport emissions, exposure to which can exacerbate existing respiratory conditions.
National Planning Policy Framework (DCLG, 2012)	The NPPF requires local authorities to encourage solutions that result in reductions in greenhouse gas emissions and promote sustainable transport. Local plans should aim to minimise pollution, and should prevent new and existing development from contributing to or being adversely affected by unacceptable levels of air pollution.

Code for Sustainable Homes (DCLG, 2010)	Category 6 of the Code for Sustainable Homes aims to reduce the emissions of gases with high global warming impact associated with the manufacture, installation, use and disposal of foamed thermal and acoustic insulating materials. Building elements affected include roofs, walls, floors, hot water cylinders, cold water storage tanks and external doors. Credits towards achieving levels of the code can be achieved by reducing the use of materials with a high global warming impact. Application of the code is one method for reducing emissions at point of manufacture, installation and disposal. Such actions can contribute to the achievement of building sustainable homes.
Local Transport Plan 3, Devon and Torbay Strategy 2011-2026 (Devon County Council, 2011)	The Devon Local Transport Plan states that technology has a key role to play in reducing emissions which affect air quality. To support the market for electric vehicles it requires a network of charging points to be delivered in convenient locations for residents. Capital priorities include improving air quality in Cullompton and Crediton through the delivery of relief/link roads.
Mid Devon Corporate Plan 2012-2015	The Mid Devon Corporate Plan notes that there are areas of poor air quality within the district, especially within the Exeter Road area of Crediton, and Cullompton High Street and Station Road. The Local Plan will need to consider how new development impacts on existing, and areas at risk of poor air quality.
Mid Devon Sustainable Community Strategy 2010-15	There are air quality issues within Crediton and Cullompton. Tackling these is a priority.
Air quality – sustainability conclusions All the air quality-related policies/strategies reviewed emphasise the need to reduce emissions as a key action to mitigate the effects of climate change. Reducing emissions is also a requirement in areas that suffer from poor air quality, such as in Crediton and Cullompton. Reviewed policies also encourage increasing the use of low carbon vehicles as part of a strategy to reduce emissions. These messages must be clearly reflected within the new Local Plan. The document should ensure that new development does not unacceptably contribute to poorer air quality, and that opportunities for reducing emissions are incorporated. New development should encourage the use of sustainable modes of transport, such as walking, cycling or the use of public transport. New development should also help to promote the market for low carbon vehicles by ensuring the delivery of electric vehicle charging infrastructure, or other latest technological infrastructure needed for low emission transportation.	

Biodiversity and green infrastructure	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
'The Natural Choice' Natural Environment White Paper (DEFRA, 2011)	The paper set out a framework for protecting and enhancing the natural environment. It proposed the introduction of Nature Improvement Areas, in order to provide bigger, connected sites for wildlife to live in and adapt to climate change in both urban and rural areas. Local Nature Partnerships. It also proposed new ways for developers to provide biodiversity offsetting, to ensure wildlife sites are not lost. Also proposed were Local Nature Partnerships to strengthen joined up action across local agencies and government.
Natural Environment and Rural Communities Act 2006	The act places a duty on public authorities (replacing s74 of the Countryside and Rights of Way Act 2000) to have regard to biodiversity as far as is consistent with the proper exercise of their functions. The act also requires the government to publish, review and revise lists of living organisms and types of habitats in England that are of principal importance for the purpose of conserving biodiversity.
Countryside and Rights of Way Act 2000	Requires local authorities to have regard to nature conservation when performing rights of way functions, including power to divert ROWs away from SSSIs. The act gives greater protection to wildlife and natural features by making provisions for the conservation of biodiversity, and improving protection for SSSIs.
Wildlife and Countryside Act 1981	The act sets in place protective measures for wildlife, including wild birds and plants. The act requires local authorities to take steps to bring the protection of wildlife to the attention of the public and schoolchildren. The act (though subsequently amended) allows designation of Sites of Scientific Interest (SSSIs) setting their management and protection measures, and also allows the designation of national nature reserves.
Conservation of Habitats and Species Regulations 2010 (and Amendment 2012)	Translates the EU 'Wild Birds Directive', requiring the protection of biodiversity through the conservation of natural habitats and species of wild fauna and flora. It places a new duty on relevant authorities to protect and create bird habitats, and a duty to avoid pollution or deterioration of bird habitats. The document also states the list of European protected species of animals and plants. The regulations require land use to plans that are likely to have a significant effect on a European site to make an appropriate assessment of the implications for the site in view of the site's conservation objectives. The local authority may only give effect to the land use plan after having ascertained that it will not adversely affect the integrity of the European site.

Biodiversity 2020: A strategy for England's wildlife and ecosystem services (DEFRA, 2002)	The strategy sets a mission for the next decade requiring a halt to overall biodiversity loss, support to healthy well-functioning ecosystems and to establish coherent ecological networks, with more and better places for nature for the benefit of wildlife and people. In particular, reducing environmental pressures on biodiversity is a specific concern. This will be undertaken through reforms of the planning system to ensure a strategic approach to planning for nature will be undertaken. The protection and improvement of the natural environment is a core objective of the planning system. Biodiversity offsetting will be piloted to assess its potential to deliver planning policy more effectively. Particular targets (to be achieved by 2020) include 90% of priority habitats in favourable or recovering condition, and at least 50% of SSSIs in favourable condition, while maintaining at least 95% in favourable or recovering condition. Additional targets include bigger and less fragmented areas for wildlife, with no net loss of priority habitat and an increase in the overall extent of priority habitats by at least 200,000ha.
England Biodiversity Strategy – Climate Change Adaptation Principles (DEFRA, 2008)	The document sets out principles for conserving biodiversity and protecting them from the direct and indirect impacts of climate change. The principles include conserving existing biodiversity, conserving protected areas and all other high quality habitats, conserving the range and ecological variability of habitats and species, maintaining existing ecological networks, creating buffer zones and high quality habitats, understand change is inevitable, make space for the natural development of rivers and coasts and raise awareness of the benefits of the natural environment to society.
National Planning Policy Framework (DCLG, 2012)	The planning system should contribute and enhance the natural and local environment by recognising the wider benefits of ecosystem services; by minimising impacts on biodiversity and providing net gains in biodiversity where possible, contributing to the Government's commitment to halt the overall decline in biodiversity by establishing coherent ecological networks that are more resilient to current and future pressures. Distinctions in policies should be made between the hierarchy of international, national and locally designated sites, so that protection is commensurate with their status. Policies should plan for biodiversity on a landscape wide scale; promote the preservation, restoration and re-creation of priority habitats, ecological networks and the protection and recovery of priority species.
Code for Sustainable Homes (DCLG, 2010)	Category 9 (ecology) states that development can meet this element of the code by promoting the use of land that already has limited value to wildlife, and to discourage it from developing ecologically valuable sites.
The Nature of Devon – A Biodiversity and Geodiversity Action Plan (Devon County	Objectives of the action plan include ensuring that planning policies recognise the importance of biodiversity and the geological features of Devon, to ensure consideration is given to nature conservation issues in the implementation of planning, to reconcile the objectives of bio- and geodiversity conservation with the need for economic and social development in achieving environmental sustainability and to maintain a dialogue with relevant authorities leading to the identification of all sites of national or international

Council, 2005)	geological heritage which do not benefit from SSSI status.
Devon Sustainable Community Strategy 2008-18	The natural environment of Devon needs to be sustained and should continue to be a priority for all those involved in planning for the future.
Mid Devon Playing Fields Strategy (2010)	Priority action points include: using the development of new and replacement schools as a catalyst for appraising and improving playing field facilities; to adopt and/or continue strong statutory policies protecting existing pitches, including those on education sites; and when planning new and improved facilities, to look holistically at the whole settlement's sporting provision – embracing public, private and education landowners.
Mid Devon Sustainable Community Strategy 2010-15	Mid Devon is a beautiful area with a high quality natural environment, bordering two national parks and the Blackdown Hills AONB, whilst there are also many Sites of Special Scientific Interest, county wildlife sites and local nature reserves. Development will need to be balanced against the priority of maintaining and enhancing the natural environment.
Biodiversity and green infrastructure – sustainability conclusions The biodioversity and green infrastructure plans and strategies reviewed have at heart the need to conserve and enhance biodiversity. Policies should avoid the deterioration of habitats, and look to preserve, restore and recreate priority habitats, with no net loss in priority habitats. Development should provide net gains in biodiversity where possible, balancing the economic and social needs of development with the objectives of bio- and geo-diversity conservation. Policies should also give consideration to biodiversity enhancing development. Policies should take a holistic approach to the provision of playing fields, considering all public and private landowners.	

Climate change mitigation and energy	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Climate Change Act 2008	The act sets a framework for the UK to achieve its long-term goals of reducing greenhouse gas emissions and ensures steps taken towards adapting to the impact of climate change. The act sets statutory emissions reductions targets to be achieved by 2050 and

	beyond. The act sets out procedures for assessing the risks of the impact of climate change and requires Government to develop an adaptation programme which contributes to sustainable development.
The Carbon Plan: Delivering our Low Carbon Future (HM Government, 2011)	The Carbon Plan sets out how the UK will achieve decarbonisation within the framework of energy policy. Within the next 10 years the plan requires the development and deployment of new technologies that will be needed to halve emissions in the 2020s. By 2050, all buildings will need to have an emissions footprint close to zero, using better insulation, energy-efficient products and having heating from low carbon sources. Manufacturing processes will need to deliver a fair share of emissions cuts. By 2050 emissions from the power sector will need to be close to zero, electricity likely being delivered by wind farms, nuclear power stations and gas and coal-fired power stations.
UK Renewable Energy Roadmap (DECC, 2011)	The UK can meet a target of delivering 15% of UK's energy consumption from renewable sources by 2020. Renewable electricity has become well established, however renewable heat is less well developed. Eight technologies have the greatest potential to help meet the 2020 target, these include onshore wind, offshore wind, marine energy, biomass electricity, biomass heat, ground source and air source heat pumps, and renewable transport.
UK Government Sustainable Development Strategy (2005)	The strategy for sustainable development aims to enable all people to satisfy their basic needs and enjoy a better quality of life without compromising the quality of life for future generations. The strategy sets out measure to realise the vision of sustainable communities within England, in both urban and rural areas, which will ensure the delivery of sustainable development, by placing it at the centre of the planning system.
National Planning Policy Framework (DCLG, 2012)	Planning plays a key role in helping shape places to secure radical reductions in greenhouse gas emissions, minimising vulnerability and providing resilience to the impacts of climate change, and supporting the delivery of renewable and low carbon technologies. Local authorities should adopt proactive strategies to mitigate and adapt to climate change. To support the move to a low carbon future, plan for new development in locations and ways to reduce greenhouse gas emissions; actively support energy efficiency improvements to existing buildings; set standards that are consistent with Government's zero carbon buildings policy. New development should consider the inclusion of decentralised energy supplies; take account of landform, layout, building orientation, massing and landscaping to minimise energy consumption. To increase the use and supply of renewable and low carbon energy developments all communities should contribute to their generation.
Code for Sustainable Homes (DCLG, 2010)	Category 1 (energy and carbon dioxide emissions) of the code aims to limit CO_2 emissions arising from the operation of a dwelling, improving the fabric energy efficiency of dwellings, encouraging the specification of low and zero carbon energy sources, promotion of cycling and the need for cycle storage. Category 3 (materials) aims to specify the use of materials with lower environmental

	impacts over their life-cycle.
Devon Sustainable Community Strategy 2008-18	The county needs to reduce its carbon emissions, and incorporate necessary adaptations to manage the effects of climate change into new developments.
Climate change mitigation and energy – sustainability conclusions The UK is committed to achieving targets in reducing greenhouse gas emissions in order to tackle climate change. Development has a significant part to play to help achieve these targets for reducing carbon emissions. Planning needs to minimise vulnerability to the impacts of climate change, and support the delivery of renewable and low carbon energy development. Improving the energy efficiency of the fabric of buildings, particularly by encouraging low or zero carbon energy sources will limit CO_2 emissions.	

Community and wellbeing (including equalities and health)	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Localism Act 2011	The aim of the act was to devolve more decision making powers from central government to local communities. The act contained a number of changes to the planning system, including the abolition of the regional strategies and the new 'duty to cooperate'. The act contains more rights for communities, including the community right to bid for assets of community value, community right to build, and neighbourhood planning.
Lifetime neighbourhoods (DCLG, 2011)	The report contains guidance on the design of neighbourhoods to make them inclusive regardless of age or disability. The components that make up lifetime neighbourhoods include good access (enabling residents to get out and about in the area they live), services and amenities (neighbourhoods with a mix of residential, retail and employment uses and access to services including health, post officer, banking facilities or cash machines), safe and inclusive built environments, with locally accessible greenspace and a range of affordable housing choices (based on inclusive design principles with adaptable space/layout to meet changing

	needs).
Laying the Foundations: A Housing Strategy for England (HM Government, 2011)	Housing and planning policies should widely positively reflect the wide range of circumstances and lifestyles of older people, who already occupy nearly a third of all homes. Planning for homes and communities where older people can remain involved with their families, friends and communities and able to choose where and how they live. New housing developments need to make suitable provision for ageing populations in the long-term, ensuring a mix of property types, including Lifetime Homes.
National Planning Policy Framework (DCLG, 2012)	Planning policies should aim to achieve places which promote opportunities for meetings between members of the community, including through mixed-use developments, strong neighbourhood centres and active street frontages; safe and accessible developments; high quality public space, which encourage the active continual use of public areas. Policies should deliver the social, recreational and cultural facilities and services the community needs, to enhance the sustainability of communities and residential environments; should guard against the unnecessary loss of valued facilities and services; ensure that local facilities can develop in a sustainable manner; and ensure an integrated approach to considering the location of housing, economic uses and community facilities and services. Local authorities should take a proactive, positive and collaborative approach to ensuring sufficient choice of school places to meet community needs. Access to high quality open spaces and opportunities for sport and recreation can make an important contribution to the health and well-being of communities.
Code for Sustainable Homes (DCLG, 2010)	Category 7 of the code (health and well-being) aims to provide homes that promote good daylighting thereby improving quality of life, improved sound insulation to reduce noise complaints from neighbours, provision of inclusive outdoor space which is at least partially private and construction of homes that are easily accessible and adaptable.
Devon Sustainable Community Strategy 2008-18	The strategy values diversity, using equality of opportunity for everyone as a guiding principle. Another guiding principle is the need to improve access to services and opportunities. There is a wide range in life expectancy between different communities, whilst Devon has a higher proportion of older people than the rest of the South West, with the number of older people due to reach one third of the population in the next 15 years. People will also need the opportunities to influence decision making which affects them.
Mid Devon Corporate Plan 2012-2015	'Better Homes' and 'Empowering our Communities' are objectives of the plan. Actions to meet the objectives include working with partners to provide extra care schemes in Tiverton and Cullompton, improve the most deprived areas of the district, work with partners to look at issues around rural isolation and access to services.

Mid Devon Sustainable Community Strategy 2010-15	The population of the district has grown by 20% over the last 20 years and much of this increase is down to inward migration from other parts of the UK. The largest increase is among those of retirement age, and meeting the service needs of the ageing population is a priority. There also needs to be good quality education and leisure facilities for children and young people.
Community and wellbeing – sustainability conclusions The reviewed plans and strategies set out the importance of delivering an integrated approach to new development. Building mixed inclusive communities, around a strong neighbourhood centre, with a mixture of housing, economic uses, community uses and services is a priority. Access to services, the creation of safe neighbourhoods and the availability of local greenspace and quality education and leisure facilities for young people are vital in the creation of healthy, inclusive communities. The provision of accessible, adaptable properties also allows older residents or those with disabilities to remain in their communities, close to family and friends, rather than having to move as their needs change. Residents should be able to influence decisions that affect them.	

Economy and employment	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
The Plan for Growth (HM Treasury/BIS, 2011)	The Government's economic policy objective is to achieve strong, sustainable and balanced growth evenly shared across the country and between industries. Goals include making the UK one of the best places in Europe to start, finance and grow a business (through the implementation of a presumption in favour of sustainable development, liberalisation of use classes and guarantees on planning application decision timetable) and encouraging investment and exports as a route to a more balanced economy (including through increased investment in low carbon technologies).
The Government's Response to the	High Streets have been left in a fragile state as people opt to visit out-of-town centres offering free parking and a range of outlets, or choose to do their shopping online. High Streets cannot rely on retail alone, and need to offer something new and different.

Mary Portas Review (DCLG, 2012	
National Planning Policy Framework (DCLG, 2012)	The planning system should do everything it can to support sustainable economic growth, by planning proactively to meet the needs of business and support an economy fit for the 21st century. Local authorities should set out a clear economic vision and strategy for their area, and set criteria or identify strategic sites for local and inward investment to meet anticipated needs. Local authorities should also support existing business sectors, whether expanding or contracting and be flexible in accommodating needs not anticipated in the plan. Long term protection of sites not likely to come forward for employment should be avoided.
Heart of the South West Local Enterprise Partnership (LEP) Business Plan	Objectives include promoting infrastructure to connect markets. Priorities include addressing existing and future constraints on business growth (emphasising the need for ongoing public and private investment to improve connections into and within the area where current connectivity is impacting on productivity and competitiveness), encouraging the roll out of future electronic communication technologies for the region, encourage a joined up approach to future housing development to secure economic prosperity (including social infrastructure and appropriate affordable housing), ensure an integrated approach to economic development recognising the constraints the planning system can place on business growth, particularly affecting rural businesses wishing to expand.
Devon Sustainable Community Strategy 2008-18	The conditions need to be created for the county to have a strong and growing economy, ensuring maximum opportunities are available for everyone to contribute and benefit from it. There needs to be sustained investment, including in business infrastructure, communications and transport infrastructure, whilst the development of the knowledge economy should be encouraged.
Mid Devon Corporate Plan 2012-2015	'Thriving economy' is one aim of the corporate plan, in order to create a prosperous economy, sure and well-paid jobs and a sustainable environment. The aims are to increase inward investment, provide start up, relocation and expansion opportunities for businesses, provide opportunities and support to new and existing businesses and regenerate and improve the market towns.
Mid Devon Economic Development Strategy (2012)	Priorities include: increasing inward investment in the district; providing start up, relocation and expansion opportunities for businesses; provision of opportunities to support new and existing businesses; regenerating and improving the market towns; and raising skill levels, education attainment and income.
Mid Devon Sustainable	The economy of the district is dominated by retail and manufacturing businesses primarily focused on the three market towns. Encouraging businesses to set up or locate within Mid Devon by providing sufficient land for development is a priority. Work needs

Community Strategy 2010-15	to be undertaken with local businesses to reduce the number of empty shops in the market towns.
Economy and economic development – sustainability conclusions The planning system should support the development of strong, sustainable and balanced economic growth. Opportunities for meeting the needs of local and inward investment should be met by facilitating the growth of local businesses, both urban and rural, and providing sufficient land for employment. There should be sustained investment in business and transport infrastructure to improve connectivity. The regeneration of the market towns of the district should be supported with a particular aim to reduce the number of empty shops.	

Historic environment	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
National Heritage Protection Plan (English Heritage, 2012)	The plan seeks to ensure that England's historic environment is not needlessly at risk of damage, erosion or loss; is experienced, understood and enjoyed by local communities; contributes to sustainable and distinctive places to live and work; and helps deliver positive and sustainable economic growth.
National Planning Policy Framework (DCLG, 2012)	Local authorities should set out a positive strategy for the conservation and enjoyment of the historic environment, recognising that heritage assets are irreplaceable, and should be conserved in a manner appropriate to their significance.
Mid Devon Sustainable Community Strategy 2010-15	The district has a rich cultural heritage with many listed buildings, conservation areas and scheduled monuments. The district will need to balance development with the need to maintain and enhance the built environment.
Killerton Park Setting Study (Land Use Consultants, 2013)	The document sets out a 'zone of potential influence' around the historic park and garden which delineates its setting. The document identifies discrete areas within the setting that have a high significance to Killerton Park, and where impacts on the setting of the historic asset are most likely to occur.

Knightshayes Setting Study (The Parks Agency, 2007)	The document describes the setting for the historic park and garden, which it states extends beyond the visual envelope, and includes an assessment of the views into and out of the site and their designed or opportunist nature. The document notes that if the character and appearance of Knightshayes is to be preserved, it is necessary, as far as reasonable, for the setting to be protected from intrusive development, and that the effect on any development on the setting should be a material consideration in the planning process.
Historic environment – sustainability conclusions The planning system should set out a positive strategy for the conservation and protection of the historic environment, considering the value it plays in delivering sustainable, distinctive places that are enjoyed by local people. A balance needs to be struck where the priorities of maintaining and enhancing the built environment are balanced against the district's development needs. The impact on heritage assets of development should be proportionally considered in relation to their significance, with the most important nationally significant assets being given the utmost protection.	

Housing	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Laying the Foundations: A Housing Strategy for England (HM Government, 2011)	The document sets the strategy for getting the housing market moving. Priorities include increasing the supply of housing, by supporting locally planned large scale development; planning reforms to give communities more control over development, including through the Community Right to Build; stronger support for custom home building (self build); need to deliver more new affordable housing, both for rent and affordable home ownership; homes need to be well-designed, of the highest quality and environmentally sustainable; delivery of Zero Carbon Homes from 2016; new housing developments need to make suitable provision for ageing populations in the long-term, ensuring a mix of property types, including Lifetime Homes.
National Planning Policy Framework (DCLG, 2012)	The supply of housing should be significantly boosted. In order to deliver a wide choice of high quality homes, local authorities should widen opportunities for home ownership, by planning for a mix of housing basing for different groups of the community; identify the size, type, tenure and range of housing required in a location and reflecting local demand; provide affordable housing where it is needed. Housing should be located where it accords with sustainable development, and new homes within the countryside should be avoided unless there are special circumstances.
Planning policy for	There should be fair and equal treatment for travellers, in a way that facilitates the traditional and nomadic way of life of travellers

traveller sites (DCLG, 2012)	while respecting the interests of the settled community. Local planning authorities should work collaboratively to develop fair and effective strategies to meet need through the identification of land for sites, planning over a reasonable timescale. In doing so, the Green Belt should be protected, and plan-making should aim to reduce the number of unauthorised developments. New policies should be fair, realistic and inclusive, and should increase the number of traveller sites in appropriate locations, reducing tensions between settled and traveller communities and enabling provision of suitable accommodation from which travellers can access education, health, welfare and employment infrastructure whilst having due regard to the protection of local amenity and the environment.
Code for Sustainable Homes (DCLG, 2010)	The code sets nine categories of sustainable design against which new dwellings can be assessed to consider their environmental sustainability. The code sets minimum standards, which are in excess of building regulations, ranging from levels 1 to 6 (6 being the highest) against a range of criteria including energy and CO_2 emissions, water, materials, surface water run-off, waste, pollution, health and well-being, management, and ecology.
The Way We Live Now (RIBA, 2012)	Consumers in the 21st century have particular requirements within modern housing that have not always been met by housing developments in recent decades. These requirements include larger windows for natural light and higher ceilings; large main living areas for eating and socialising; layouts which take into account technology used within the home; space for private time away from other members of the household; private outside space, particularly for families, or access to green public space in urban locations; long-term and short-term storage for functional items; dedicated space for domestic utility tasks, including washing, drying and ironing clothes, as well as storing vacuum cleaners, rubbish bins and recycling; and, options for different layouts.
Devon Sustainable Community Strategy 2008-18	The shortage of affordable housing is a significant issue as average house prices are nearly 10 times average earnings in Devon. Demand for affordable housing has increased. The county will need to deliver good quality, affordable housing, with sufficient development to respond to projected growth, and include provision for the homeless and vulnerable people.
Commissioning Strategy for Extra Care Housing (Devon County Council, 2010)	Increasing numbers of people are living longer, but with more complex conditions such as dementia and chronic illnesses. By 2022 20% of the English population will be over 65, and this figure is predicted to be even higher in Devon. The provision of Extra Care Housing for older people is an important element in preventing older people from moving into residential care and increasing choice and independence. Devon intends to develop an extra care housing programme to promote the health and well being of older people who wish to live independently.
A Community Housing Strategy for Mid Devon 2010-	Mid Devon's housing vision is to provide good quality housing both in terms of the condition and surroundings of existing stock and the supply of new housing. Large housing waiting lists indicate the existence of a problem with the availability of affordable housing, both in the social rental sector and home owner sector. Provision of rural affordable housing is also a priority, though local

2015	opposition to such development can be an issue, though good consultation has helped the process. The plan contains an objective of locating a suitable site in Tiverton for an extra care facility.
Mid Devon Corporate Plan 2012-2015	'Better Homes' is a priority for the corporate plan. High rates of inward migration from other parts of the country have led to house price inflation, with prices now far outstripping local average wages. This situation is even further felt within the rural parts of the district. An ageing population also needs support to live in their own homes and suitably adapted accommodation. The district needs to ensure that there is sufficient decent housing for local residents and key workers who cannot afford to pay market prices.
Mid Devon Sustainable Community Strategy 2010-15	High inward migration has led to house price inflation, where prices have more than doubled in the last ten years, making them unaffordable for many in the district. There needs to be sufficient decent affordable housing for local residents and key workers. Also, people need to be able to remain in their homes longer as they get older.

Housing – sustainability conclusions

Nationally the country has not been building enough homes to house its population, and therefore significantly boosting the supply of homes is a priority. The proportion of the population of people above retirement age has increased and there is a need to provide appropriate housing in response. Providing for an ageing population or people with disabilities may need to be addressed through the delivery of homes that can be adapted as peoples circumstances change, or through the delivery of extra care housing. Wide variety of home types should be provided, across a range of tenures to meet the needs of the population. In response to the fact that house prices are nearly ten times local earnings, there is a need to provide affordable housing to address long social housing waiting lists. Such issues are also acutely felt in some of the more rural locations of the district, where house prices may be even higher, and will need to be addressed through affordable housing delivery to meet an identified need. Provision for the needs of gypsies and travellers should be made planned for which seeks to balance their locational, economic and social needs with the protection of amenity and the environment. There is a need for modern homes to be environmentally sustainable, and meets the consumer demands of the population, including provision of sufficient storage space and private outdoor space.

Infrastructure	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**

National Infrastructure Plan: update 2012 (HM Treasury & Infrastructure UK)	The plan outlines the government's vision for the future of UK economic infrastructure. It sets out the challenges facing the UK infrastructure and the government's strategy for meeting the infrastructure needs of the economy containing particular commitments for investment in important infrastructure projects and plans for attracting new private sector investment. Priorities include: ensuring the road network is fit for the UK's future transport needs; protecting homes and businesses from flooding and unlocking sites for development; enabling the UK to have the fastest and best connected communications networks in Europe; investing to ensure the UK has the facilities to maintain and develop its world class research base; ensuring the security of supply and shift to a diverse, low carbon power sector; moving to a 'zero waste economy'.
Gas Generation Strategy (DECC, 2012)	Gas in an integral part of the UK's generation mix and is a reliable, flexible source of electricity. The government expects that gas will continue to play a major role in our electricity mix over the coming decades, alongside low-carbon technologies as we decarbonise our electricity system. Measures outlined in the plan are designed to ensure that: adequate gas generation capacity is available, including ensuring we maintain an appropriate capacity margin to maintain security of electricity supply; flexible plant is available to meet the intermittency associated with renewables and that the necessary gas supply infrastructure is in place to support the role of gas in generation.
National Planning Policy Framework (DCLG, 2012)	Planning policies should recognise and seek to address potential barriers to investment including a lack of infrastructure, and should identify priority areas for infrastructure provision. Local authorities should work with neighbouring and transport authorities to develop strategies for the provision of viable infrastructure necessary to support sustainable development, including large scale facilities such as rail freight interchanges, roadside facilities, and other major generators of travel demand. The provision of advanced, high quality communications infrastructure is essential for sustainable economic growth, and local plans should support the expansion of electronic communications networks. To meet the needs of local communities, planning policies should plan positively for community facilities such as local shops, meeting places, sports venues, cultural buildings, public houses and places of workshop. Policies should also take a positive, proactive approach to ensuring there is a sufficient choice of school places available to meet the needs of existing and new communities.
Infrastructure – sustainability conclusions The reviewed plans and strategies highlight the importance of delivering infrastructure to meet the needs of existing and new communities. The Government places great importance on the delivery of the following infrastructure as part of ensuring sustainable economic development: transportation, flood protection, communications, research, energy and waste. Community facilities and schools are important infrastructural elements that are required to meet the needs of local communities as part of the delivery of sustainable development.	

Land (including agricultural land, brownfield land and contaminated land)	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Safeguarding Our Soils: A Strategy for England (DEFRA, 2009)	Soil is a fundamental and essentially non-renewable natural resource, providing an essential link between the components that make up our environment. Soils vary hugely from region to region and even from field to field. Soils perform valuable functions including nutrient cycling, water regulation, carbon storage, support for biodiversity and wildlife, and providing a platform for food and fibre production and infrastructure. Soils have been degraded by human actions, and are vulnerable to erosion, compaction and loss of organic matter; such changes are likely to be exacerbated by climate change. By 2030 all England's soils will be managed sustainably and degradation threats tackled successfully. Planning decisions must take sufficient account of soil quality, particularly when significant areas of the best and most versatile agricultural land are involved. The document also considers the need for local authority officers to make proportionate and robust decisions regarding the remediation of contaminated land. Sustainable remediation that does not involve the wholesale removal and replacement of soil should be encouraged.
National Planning Policy Framework (DCLG, 2012)	The planning system should contribute and enhance the natural environment by protecting and enhancing soils. It should prevent new and existing development from contributing to or being put at unacceptable risk from, or being adversely affected by unacceptable levels of soil pollution or land instability. The planning system should, where appropriate, seek the remediation and mitigation of despoiled, degraded, derelict, contaminated and unstable land. Plans should allocate land with the least environmental or amenity value. The re-use of land that has been previously developed (brownfield) should be encouraged (provided it is not of high environmental value). The development of lower quality land should be prioritised over the best and most versatile agricultural land. Local authorities can set their own approach to determining housing densities to reflect local circumstances.
Code for Sustainable Homes (DCLG, 2010)	Category 9 (ecology) of the code aims to promote development on land that already has a limited value to wildlife and discourages the development of ecologically valuable sites. An additional aim is to promote the most efficient use of a building's footprint by ensuring that land and material use is optimised across the development.
Land – sustainability conclusions Soil is a fundamental natural resource that has been degraded by human action. Soils should be protected and enhanced. Planning should consider allocating or developing land with the least environmental value, prioritising lower quality land. Consideration of the soil quality of best and most versatile	

agricultural land, and the need to remediate contaminated land should be a planning consideration. When considering development, the use of land should be optimised across a site to ensure the efficient use of building footprints whilst setting a density of development appropriate to local circumstances.

Landscape	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Countryside and Rights of Way Act 2000	Places a duty on relevant authorities in exercising their functions, to have regard to the effect on land in an AONB, and to have regard to the purpose of conserving and enhancing the natural beauty of the AONB.
National Planning Policy Framework (DCLG, 2012)	The planning system should contribute to and enhance the natural environment by protecting and enhancing valued landscapes. Great weight should be given to conserving landscape and scenic beauty of National Parks and Areas of Outstanding Natural Beauty, and planning permission for major development in these designated areas should be refused except in exceptional circumstances.
Devon Landscape Policy Group Advice Note No. 2: Guidance on the siting, design and assessment of wind and solar PV developments in Devon (Consultation draft, 2012)	Devon is faced with a wide range of challenges arising from a changing climate. Balancing the need to support the transition to a low carbon future and the need for energy security with the management of Devon's unique and valued landscape is one of these challenges. The landscape is also a major contributor to a strong tourism industry. The conservation of special landscape character is a core principle of the NPPF. However, Devon also has good conditions to produce wind and solar electricity, but it is important that the characteristics of Devon's landscape are not unacceptably harmed by poor design or inappropriate siting of renewable or low carbon technologies.
Dartmoor National Park Authority Core Strategy (2008)	Purposes of the park are to conserve and enhance the natural beauty of the National Park, and to promote opportunities for the understanding and enjoyment of its special qualities. The core strategy sets a vision for the park, highlighting the distinctive characteristics and special qualities of Dartmoor and points to the role of planning in sustaining those qualities.

Blackdown Hills AONB Management Plan 2009-14	The plan highlights the special qualities of the AONB as the isolated, unspoilt rural area; the diversity of landscape patterns and pictures; the unique geology; and the architectural appeal. Priorities include maintaining and enhancing the features that make the landscape distinctive; the sense of tranquillity is enjoyed free from noise and visual intrusion; key wildlife sites and sites of geological importance are conserved and enhanced; key natural resources such as air, water and soils are protected and conserved; greenhouse gas emissions are reduced; sustainable agricultural practices that converse and enhance the landscape, environment, water quality and nature conservation; sustainable recreation and tourism, based on the qualities of the landscape; new development to be of the highest quality, in keeping with landscape, historic character and other special qualities; use of traditional, local materials and energy/water efficient technologies; restricting or reducing noise and light pollution; restrictions on major developments in or adjacent to the AONB; appropriate affordable housing to enable local people to remain in their communities; a sustainable rural economy that conserves and enhances landscape character; and access to appropriate local facilities, services and amenities for local communities.
Landscape – sustainability conclusions Devon has a unique and valued landscape, which also contributes towards the tourism attraction of the county. Mid Devon has borders that are adjacent or in close proximity to two national parks, whilst the Blackdown Hills Area of Outstanding Natural Beauty crosses the east part of the district. Planning policies should offer protect valued landscapes, offering protection and enhancement of the most valued landscapes such as national parks and AONBs. The protection of the landscape needs to be balanced against the challenge of mitigating the effects of climate change through the transition to a low carbon future, particularly achieved through the development of renewables technologies, which are often located in rural areas.	

Minerals	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
National Planning Policy Framework (DCLG, 2012)	Minerals are essential to support sustainable economic growth and our quality of life. It is therefore important that there is a sufficient supply of material to provide the infrastructure, buildings, energy and goods that the country needs. However, minerals represent a finite resource, and it is important to make best use of them to secure their long-term conservation.
Technical Guidance to the National	The technical guidance sets out planning considerations including those to protect communities in proximity of mineral workings, control of dust and noise emissions, stability in surface mine workings, restoration and aftercare of mineral sites, and the

Planning Policy Framework (DCLG, 2012)	landbanking of industrial minerals.
Code for Sustainable Homes (DCLG, 2010)	Category 3 of the code (materials) states that consideration of the environmental impact of materials can contribute to the development of sustainable homes. This part of the code aims to specify materials with lower environmental impacts over their life-cycle; to promote the specification of responsibly sourced materials for the basic building elements, as well as finishing elements.
Devon Minerals Plan 2011-2031 (Options Consultation, 2011)	Devon has minerals that are of national, and in some cases, international importance. The objectives of the document include: securing mineral development with minimal transportation by road while conserving environmental assets; making prudent use of existing resources; reinforce the distinctiveness of Devon's built environment through appropriate use of local sources of materials; safeguard mineral resources and associated infrastructure; manage mineral development in a manner that protect Devon's communities from adverse impacts and conserves the environment.
Minerals Local Plan (Devon County Council, 2004)	Objectives of the plan including: striking a balance between the demand for minerals and the need to protect the environment, having regard to sustainable development; to maintain a stock of reserves; to re-use waste minerals to reduce the requirement for new resources; to protect the County's earth science and nature conservation interest, historic environment, water environment and landscape character; to identify Mineral Working Areas; to consult with communities; and to prevent sterilisation of mineral resources by other development.
Minerals – sustainability conclusions There needs to be a sufficient supply of minerals to ensure the long-term ability to deliver infrastructure and development. The need for a supply of minerals needs to be balanced with the priority of protecting the environment. Planning for minerals extraction does not fall within the remit of Mid Devon District Council, being instead undertaken by Devon County Council. However, the consideration of the environmental impact of materials used in buildings and the desire to promote locally sourced materials is a district issue, as is the effect on local communities who are close proximity to mineral workings.	

Rural areas	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**

Rural Statement (DEFRA, 2012)	Rural areas are home to one-fifth of the English population, and 28% of England's businesses. The key priorities include wanting rural businesses to make a sustainable contribution to national growth; engaging directly with rural communities; wanting rural people to have fair access to public services and be actively engaged in shaping the places in which they live.
Rural Economy Growth Review (DEFRA, 2011)	Businesses in rural areas make a substantial contribution to the national economy, generating about 22% of employment. Between 2001 and 2009, the population of England's rural areas grew 10% faster than urban areas. There are strong interdependencies between market towns and their rural hinterlands. Smaller businesses play a relatively strong role in rural areas, accounting for over 50% of employment in rural areas, whilst home working rates are more than twice as high in rural than urban areas. Growth of rural businesses is restricted by broadband coverage, with 23% of rural household having no or slow connections. Populations of rural areas tend to be older than urban populations, and there are a substantially lower proportion of ethnic minority backgrounds.
Foresight. The Future of Food and Farming (Government Office for Science, 2011)	The global food system will experience an unprecedented confluence of pressures over the next 40 years. Population size will increase, raising demand, whilst competition for land, water and energy will intensify, while the effects of climate change will become increasingly apparent. Priorities for action include making sustainable food production central in development; working on the assumption there is little new land for agriculture; promoting sustainable intensification; including the environment in food system economics; reducing waste; anticipate major issues with water availability for food production and work to change consumption patterns.
National Planning Policy Framework (DCLG, 2012)	National planning policy encourages supporting economic growth in rural areas to create jobs and prosperity. This can be achieved through supporting sustainable business growth, development and diversification of agricultural activities, supporting rural tourism and retaining local services. The economic value of retaining the best and most versatile agricultural land should be considered.
Mid Devon Sustainable Community Strategy 2010-15	In a rural district, access to vital services can be a significant problem. Communities in rural areas need access to facilities and services they need. Isolated small rural communities experience issues with transport and declining services. Broadband speeds needs to be increased in rural areas.
Rural areas – sustainability conclusions The population in rural areas has grown at a greater rate than urban areas in last decade. Rural businesses make a substantial contribution to the economy and should be supported to grow. Agriculture remains an industry that has faced many challenges in recent decades and such enterprises should be supported to diversify in order to benefit the rural economy. Rural areas experience social issues such as poor access to services and facilities, whilst the growth of their economies may be hampered by poorer broadband speeds.	

Transport	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Department for Transport Priorities (gov.uk, 2013)	DfT priorities include: continuing to develop the preparations for a high speed rail network; improving existing rail network and creating new capacity; tackling congestion on roads; continuing to improve road safety; encouraging sustainable local transport; promoting lower carbon transport, such as walking and cycling; supporting the development of the market for electric and other ultra-low emission vehicles; supporting the development of aviation; and maintaining high standards of safety and security for passengers and freight.
Door to Door: A strategy for improving sustainable transport integration (DfT, 2013)	The government wants more journeys to be made by public transport, cycling and walking. The vision is for an inclusive, integrated and innovative transport system where the use of sustainable transport is made more attractive for the entire door-to-door journey. Specific actions to achieve these goals include investing in high-quality cycling and walking environment, particularly close to train and bus stations; and ensuring the future needs of society are considered at the beginning of any new developments, so that interchange facilities can be designed around expected customer needs from the outset.
Creating Growth, Cutting Carbon: making sustainable local transport happen white paper (DfT, 2011)	The document sets a vision for a transport system that is an engine for economic growth, but is also greener and safer and improves quality of life. It notes that investment on its own is not enough, as people will need to make transport choices that are good for society as a whole. Two-thirds of all journeys are less than five miles – many of which could be easily walked, cycled or undertaken on public transport. Many drivers would be willing to drive less (particularly for shorter trips), if practical alternatives were available. The report highlighted key areas which needed to be addressed to encourage more people to use sustainable travel options including: making connections between different steps in the journey, and different modes of transport, easier; and providing better interchange facilities.
National Planning Policy Framework (DCLG, 2012)	Transport policies have an important role to play in facilitating sustainable development. The transport system needs to be balanced in favour of sustainable transport modes, giving people a choice about how they travel. Different approaches will be required within different communities. Developments that generate significant movement should be located where the need to travel is minimised and the use of sustainable modes of travel maximised. Developments should exploit opportunities for sustainable development and designed to: accommodate efficient delivery of goods; give priority to pedestrian and cycle movements and have access to high quality public transport facilities; create safe and secure layouts which minimise conflicts

	between different transport groups; incorporate facilities for charging low emission vehicles; and consider the needs of people with disabilities.
Local Transport Plan: Devon and Torbay Strategy 2011-2026	Devon and Torbay's transport system will offer business, communities and individuals safe and sustainable travel choices. The transport system will help to deliver a low carbon future, a successful economy and a prosperous, healthy population living in an attractive environment. Objectives include: deliver and support new development and economic growth; making best use of transport network and protect existing transport assets; work with communities to provide safe, sustainable and low carbon transport choices; strengthen and improve the public transport network; and make Devon the 'place to be naturally active'.
Code for Sustainable Homes (DCLG, 2010)	Category 1 of the code (energy and carbon dioxide emissions) can be delivered in part by the provision of cycle storage space within new dwellings. The code states that the wider use of bicycles as transport reduces the need for short car journeys and the associated CO_2 emissions.
Transport – sustainability conclusions Reducing carbon emissions produced as a result of transportation is a national priority. This can be achieved by increasing opportunities for the use of sustainable modes of transport, such as public transport, walking and cycling; through the delivery of opportunities to increase the use of electric vehicles and improving the connections between various modes of transportation. Improve the condition of local transport network, protecting existing transportation assets. Ensure safe and sustainable transport options are available to communities.	

Waste	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Department for Communities and Local Government: Waste Priorities (gov.uk, 2013)	The main objective of government policy on waste is to protect human health and the environment by producing less waste and by using it as a resource where possible. Waste should be managed according to the 'waste hierarchy' of prevention, reuse, recycling and composting, and then using waste as a source of energy, with disposal (waste going to landfill) being a last resort. Objectives of government waste policy include: preparation of planning strategies by local authorities in which communities take more responsibility for their own waste; handling waste safely, without endangering human health and without harming the environment, and disposing of waste on one of the nearest appropriate places; assessing the suitability of waste sites, including the physical and environmental constraints on development and the cumulative effect of previous waste disposal facilities on the well-

	being of the local community.
Planning Policy Statement 10: Planning for Sustainable Waste Management (DCLG, 2011)	Key objectives for local authorities include: helping to deliver sustainable development through driving waste management up the waste hierarchy, addressing waste as a resource and looking to disposal as the last option, but one which must be catered for; providing a framework within which communities take more responsibility for their own waste; help implement the national waste strategy; help secure the recovery or disposal of waste without endangering human health and harming the environment; ensure the design and layout of new development supports sustainable waste management.
Waste Strategy for England (DEFRA, 2007)	Objectives of the strategy are to: decouple waste growth from economic growth and put more emphasis on prevention and re-use; meet and exceed landfill diversion targets; increase diversion from landfill of non-municipal waste and secure better integration of treatment for municipal and non-municipal waste; secure investment in infrastructure needed to divert waste from landfill; and get the most environmental benefit from that investment, through increased recycling of resources and recovery of energy from residual waste using a mix of technologies.
Code for Sustainable Homes (DCLG, 2010)	Category 5 of the code (waste) has the aim of providing adequate internal and external storage space for non-recycling waste and recyclable household waste. The code also aims to promote resource efficiency via the effective and appropriate management of construction site waste. Additional credits can be achieved by promoting the provision of compost facilities to reduce the amount of household waste sent to landfill.
Devon Sustainable Community Strategy 2008-18	Waste production will need to be reduced so that resilience on landfill is decreased, whilst the need to process waste overall is reduced, whilst recycling of all types needs to increase.
Devon Waste Plan: Preferred Options (2012)	Objectives of the plan include: playing a major role in the development of an integrated approach to waste policy, waste-related behavioural change, waste collection and infrastructure delivery; enabling waste management to supporting a sustainable economy; tackling climate change by reducing the carbon footprint of waste management; meet the needs of Devon through the delivery of new waste management infrastructure; apply the 'waste hierarchy'; support the delivery of waste facilities that use a range of technologies; achieve a reduction in negative waste management impacts on the natural, built and historic environment; and minimise the negative transport impacts of waste management. Consider four sites within Mid Devon as potential locations for recovery and/or disposal.

Devon County Waste Local Plan (2006)	The objectives of the plan are: to promote encourage communities to take more responsibility for the waste they create; to minimise any adverse effects on human health and the environment caused by the introduction of waste management facilities, and to enhance the local environment when considering plans for site restoration, after-use and aftercare; to ensure than any proposal for a waste management facility is achieved in as sustainable a manner as possible; to ensure that the management of waste is undertaken in accordance with the 'waste hierarchy' of reduction, re-use, recycling and composting, energy recovery and disposal; to encourage the provision of waste management facilities at or close to major centres of population; to ensure Devon's waste is treated or disposed of within the County; and to promote the establishment of an effective and integrated network of waste management facilities to serve national, regional, sub-regional and local needs.
Mid Devon Waste Strategy & Recycling Plan 2008 to 2013	Priority 1 is to reduce waste, particularly the amount of municipal waste going to landfill, increasing the 'dry' recycling rate, offering opportunities to participate in organic waste composting, and work with Devon County Council to secure provision of a Recycling Centre in the Culm Valley area.
Mid Devon Corporate Plan 2012-2015	A priority of the plan is to reduce the amount of waste going to landfill and increase recycling/composting.
Mid Devon Sustainable Community Strategy 2010-15	The district needs to reduce the amount of waste that goes to landfill.
Waste – sustainability conclusions National waste priorities are to protect human health and the environment whilst ensuring the delivery of sustainable waste management. Reducing the carbon footprint of waste will also contribute towards tackling climate change. New development should contribute to sustainable waste management, through the application of the waste hierarchy where disposal is the last resort, instead prioritising re-use, recycling or recovery.	

Water	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**

Flood and Water Management Act 2010	The act gives the Environment Agency a strategic overview of the management of flood and coastal erosion risk in England. It also requires upper tier authorities (locally this is Devon County Council) responsibility for preparing a strategy for managing flood risk from groundwater, surface water and other watercourses. The act places a duty on local authorities to aim to make a contribution towards the achievement of sustainable development when discharging flood management functions. The act introduces standards for the design, construction, maintenance and operation of new rainwater drainage systems, including sustainable drainage systems, and introduces an approving body (which is generally the local authority).
Water for people and the environment – Water Resources Strategy for England and Wales (Environment Agency, 2009)	The strategy sets out how the Environment Agency believes water resources should be managed to 2050 and beyond, to ensure that there will be enough water for people and the environment. The strategy sets out the EAs role to manage the water resources, and plan how to use them in a sustainable way. It notes that pressures on water resources are growing, given that more houses are being built, population is increasing and forecasts show we will use more water. The strategy sets out how the EA believes water resources should be managed to deliver a secure supply and safeguard the environment.
Water Resources Strategy Regional Action Plan for the South West (Environment Agency, 2009)	The action plan shows how the South West region will meet the challenges posed by pressures on water resources over the next 50 years. Actions include ensuring the water supply and demand is resilient to the effects of climate change, reducing carbon emissions associated with the supply of water, managing catchments better to protect water resources, enhancing biodiversity, reducing flood risk and improving the water efficiency of new housing and commercial developments.
National Planning Policy Framework (DCLG, 2012)	The NPPF requires local planning authorities to adopt proactive strategies to mitigate and adapt to climate change, taking full account of flood risk and water supply and demand considerations. New development should be planned to avoid increased vulnerability to the impacts arising from climate change. Local authorities should prevent new and existing development from contributing to or being put at unacceptable risk from water pollution. Local authorities should plan strategically and work with other authorities for the provision of infrastructure for water supply and flood risk. Development should be directed away from areas at highest risk of flooding. Land should be safeguarded that is required for current and future flood management. New development should reduce the causes and impacts of flooding, and should not increase flooding elsewhere.
Technical Guidance to the NPPF	The overall aim should be to steer new development to Flood Zone 1. Where there are no reasonably available sites in Flood Zone 1, local planning authorities allocating land in local plans should take into account the flood risk vulnerability of land uses, and

	consider reasonably available sites in Flood Zone 2. Only where there are no reasonably available sites in Flood Zones 1 or 2 should the suitability of sites in Flood Zone 3 be considered.
South West River Basin Management Plan (Environment Agency, 2009)	The plan is prepared under the European Water Framework Directive, which requires all EU countries throughout the European Union to manage the water environment to consistent standards. Priorities for local government include ensuring that local planning document take into account the objectives of the SWRBMP, actions to reduce the physical impacts of urban development on artificial or heavily modified water bodies, promotion of the use of sustainable urban drainage systems and promote sustainable water management best practice through pre-application discussions with developers.
Code for Sustainable Homes (DLCG, 2010)	Category 2 (water) of the code is mandatory, and requires a reduction of potable water in the home from all sources, through the use of water efficient fittings, appliances and water recycling systems. Category 4 (surface water run-off) is mandatory and requires the design of surface water drainage for housing developments which avoid, reduce and delay the surcharge of rainfall run-off to watercourses and public sewers using sustainable drainage techniques. This protects receiving waters from pollution and minimises the risk of flooding.
A Warm Response - Our Climate Change Response (Devon County Council, 2005)	A strategic objective of the plan is to adapt to climate change by 'climate-proofing' for current and future weather hazards, in particular the impact of flooding. Consideration of actions required for the maintenance or adaptation of strategic infrastructure such as the built environment, transport network and utilities.
Devon Sustainable Community Strategy 2008-18	The county will need to incorporate necessary adaptations to mitigate the effects of climate change and flooding into new development.
Mid Devon Strategic Flood Risk Assessment (2009)	Mid Devon has suffered serious flooding in the past, and the risk of flooding is likely to increase in the future as a result of climate change. With more than 7000 homes to be built in the district over the next 20 years (at the time of writing), spatial planning must take account of this risk to ensure that new development is sustainable.
Water – sustainability conclusions Managing flood risk and the effects of climate change is a key national and local priority, particularly as Mid Devon has suffered serious flooding in the past. There is also growing pressure on water resources and a need to improve resource efficiency. In particular new housing and commercial development should incorporate measures to improve water efficiency and reduce surface water run-off which can contribute to flooding. Water bodies should be protected from the effects of pollution, and there should be no reduction in their quality or status.	

Mid Devon DISTRICT COUNCIL

Local Plan Review: Proposed Submission Consultation

Sustainability Appraisal

February 2015

Contents

1. Background 3

Appendix 1: Full review of plans and programmes 77

Appendix 2: Sustainability appraisal of policies and site options 108

Appendix 3: Undeliverable site options 675

1 Background

The Local Plan

1.1 Mid Devon's Local Plan sets the levels and distribution of development and strategic policies for the district. The document also sets out the infrastructure requirements needed to deliver the strategic objectives and states the policies by which development management decisions are made when determining planning applications. The existing Local Plan is made up of three parts:

- Core Strategy (adopted 2007)
- Allocations and Infrastructure Development Plan Document (adopted 2010)
- Local Plan Part 3: Development Management policies (adopted 2013)

1.2 Because the first part of the current plan was adopted seven years ago, it now needs to be brought up to date. The Council has therefore reviewed the targets, allocations, and policies contained within the current plan to reflect the latest evidence and guidance including the National Planning Policy Framework (2012). In reviewing the Local Plan, the Council has produced one document which will supersede the three parts of the existing plan. This new document entitled 'Local Plan Review: Options Consultation' (or Options Consultation), was out for consultation February – March 2014. The plan sets out the strategic options facing the district in terms of where new development could be located, and in what quantity. The Council has taken into account the representations received during the Options Consultation to compile the Local Plan Review Proposed Submission 2013-2033 (or Local Plan Review), which contains preferred policies and allocations. An outline of the contents of the Local Plan Review is set out below:

Chapter 1.0	Introduction
	Preparation of the Local Plan
	Vision, Spatial Strategy and Key Diagram
	Neighbourhood Planning
	Superseded Policies
Chapter 2.0	Development Strategy and Strategic Policies
	S1 Sustainable development priorities
	S2 Amount and distribution of development
	S3 Meeting housing needs
	S4 Ensuring housing delivery
	S5 Public open space
	S6 Employment
	S7 Town centres
	S8 Infrastructure
	S9 Environment
	S10 Tiverton
	S11 Cullompton
	S12 Crediton
	S13 Villages
	S14 Countryside
Chapter 3.0	Site Allocations
	Tiverton (Sites TIV1-TIV15)

	Cullompton (Sites CU1-CU21)
	Crediton (Sites CRE1-CRE11)
	Rural Areas (23 Sites BA1-WI2)
Chapter 4.0	Managing Development (DM1 – DM29)
Chapter 5.0	Monitoring
	Annex 1 Glossary
	Annex 2 Low Emission Assessments:
	Proposed Submission Policies Map

1.3 The following sets out the vision and main objectives of the Local Plan Review:

Mid Devon will be a prosperous and sustainable rural district, where individuals, families and communities can flourish as a result of access to good quality local employment, housing and services and a clean, green, safe environment. Local communities and private, public and voluntary organisations will work in partnership to meet social and economic needs in ways that enhance the environment and reduce the area's carbon footprint. High quality development in the right places with appropriate infrastructure will bring regeneration, social and economic benefits and enhance towns, villages and countryside while promoting sustainable use of energy and other resources and tackling the causes and effects of climate change. The Council will use planning and related powers to:

Promote community well-being

- Diverse, inclusive communities with a vibrant mix of accessible uses and local services
- Sufficient 'fit for purpose', decent homes which people can afford
- Safe, healthy and crime free neighbourhoods
- Active, involved, well-educated citizens
- A good range of opportunities to travel by active and sustainable modes
- Strong town and village communities
- Green Infrastructure for personal leisure amenity space

Support sustainable economic success

- A good range of jobs in urban and rural areas
- Growth that respects Mid Devon's relationship with Exeter and Taunton
- Profitable and expanding local businesses, attracting inward investment
- Attractive, lively and successful town centres
- Tourism and leisure enterprises that benefit the whole district
- Recognition of the role of heritage as a tourism attraction

Conserve and enhance the area

- High quality design in new developments
- Clean air and water
- Countryside, environment and heritage assets conserved and enhanced
- Attractive countryside providing for biodiversity and employment
- Effective reuse of existing buildings
- Conservation and enhancement of protected landscapes

Respect environmental limits

- Social and environmental benefits of development are optimised
- Developments use land, energy and resources effectively

- Waste is minimised and recycling rates are high
- Public transport, walking and cycling are encouraged
- Floodplains remain undeveloped
- Renewable energy projects within environmental limits

1.4 It is anticipated that the final document will be adopted, following an 'Examination in Public' in 2015.

Purpose of the Sustainability Appraisal / Strategic Environmental Assessment Report

1.5 In order to be in accordance with EU and UK legislation, any plan must be subject to a Sustainability Appraisal/Strategic Environmental Assessment (SA/SEA). SA/SEA (or SA for short) assists in promoting sustainable development through integrating sustainability considerations into plan making. It is an iterative, ongoing process and integral to plan making. The process helps to consider the effects of the plan (and the effect without the plan) on the environment, on people and on the economy. It helps planning authorities to consider the merit of a variety of options to help determine the most sustainable policy decisions.

1.6 The SA highlights potential negative impacts of a plan, thereby providing the opportunities for these effects to be avoided or mitigated. However, the SA cannot ensure that development will be absolutely sustainable in all its aspects. It is possible that in some cases development which is in some respects less sustainable may still have to take place, perhaps where the social and/or economic benefits outweigh environmental impact.

Sustainability Appraisal Process

1.7 The Sustainability Appraisal Scoping Report (July 2013) (or SA Scoping Report) which accompanied the Local Plan Review: Scoping Report (or Scoping Report) was the first stage in the preparation of an SA for the new Local Plan Review. As set out in Government guidance on applying SA, the SA Scoping Report involved setting the context and objectives, establishing the baseline and deciding on the scope as follows:

- Identifying other relevant policies, plans and programmes, and sustainability objectives
- Collecting baseline information
- Identifying sustainability issues and problems
- Developing the SA framework
- Consulting on the scope of the SA

1.8 The interim Sustainability Appraisal (January 2014) (or interim SA) built on the initial findings set out in the Scoping Report SA. This was the next stage of preparing the SA which involved the developing and refining of options and assessing their effects. Government guidance on undertaking a SA defines this stage as including the following aspects:

- Testing the plan objectives against the SA
- Developing plan options
- Predicting the effects of the plan
- Evaluating the effects of the plan
- Considering ways of mitigating adverse effects and maximizing beneficial effects

1.9 The interim SA undertook an initial assessment of the effects of the plan against the framework of indicators proposed within the scoping report. It includes a number of initial recommendations against each policy or site in order to mitigate their negative impacts or maximise the positive. The production of an interim SA, reflected the iterative nature of the appraisal process, and provides a basis against which policies and allocations could be continually assessed as the preparation of the Local Plan Review progressed.

1.10 This document is the proposed submission version of the SA and has been produced alongside the proposed submission version of the Local Plan Review. The proposed submission version has taken account of any representations received during the consultation period regarding significant effects of the plan. This SA sets out the SA process and how it complies with the SEA Directive, the sustainability context, sustainability methodology, an outline for the reasons for selecting or rejecting alternatives and the measures envisioned to monitor them.

1.11 The appendices outline in more detail the contents and main objectives of the plan and the relationship with other plans and the likely significant effects on the environment of policy options including measures envisaged to present, reduce and as fully as possible offset any significant adverse effects on the environment. A non-technical summary of this information is also provided.

Compliance with the Strategic Environmental Assessment Directive and Regulations

1.12 The Environmental Assessment of Plans and Programmes Regulations (2004) set out certain requirements for reporting the SA process. The regulations specify that the SA report must set where it has met the SEA requirements. This is set down in the following table:

The SEA Directive requirements	**Section within this SA that meets the requirement**
Preparation of an environmental report in which likely significant effects on the environment of implementing the plan or programme, and reasonable alternatives taking into account the objectives and geographical scope of the plan or programme, are identified, described and evaluated	The SA as a whole
a) An outline of the contents and main objectives of the plan and the relationship with other plans	Sections 1, 2 and Appendix 1
b) The relevant aspects of the current state of the environment and the likely evolution thereof without implementation of the plan or programme	Section 2
c) The environmental characteristics of areas likely to be significantly affected	Section 2
d) Any existing environmental problems which are relevant to the plan including in particular those relating to any areas of particular environmental importance	Section 2
e) The environmental protection objectives, established at	Section 2 and Appendix 1

international, community or national level, which are relevant to the plan or programme and the way those objectives and any environmental considerations have been taken into account	
f) The likely significant effects on the environment, including on issues such as biodiversity, population, human health, fauna, flora, soil, water, air, climatic factors, material assets, cultural heritage including architectural and archaeological heritage, landscape and the interrelationship between the above factors. These effects should include secondary, cumulative, synergistic, short, medium and long-term permanent and temporary, positive and negative effects.	Appendix 2
g) The measures envisaged to present, reduce and as fully as possible offset any significant adverse effects on the environment of implementing the plan or programme	Appendix 2
h) An outline of the reasons for selecting the alternatives dealt with, and a description of how the assessment was undertaken including any difficulties (such as technical deficiencies or lack of know-how) encountered in compiling the required information	Sections 3 and 4
i) A description of the measures envisaged concerning monitoring	Section 5
j) A non-technical summary of the information provided under the above headings	Non-technical summary

2 Sustainability context

Review of relevant plans and programmes

2.1 The Local Plan Review has not been developed in isolation – its content has been influenced by a large number of factors and policies defined by EU or UK legislation, national policies and other plans and strategies at a local level. Understanding the relationship between the Local Plan Review and other plans is important as it has influenced the options considered in preparation of the Plan. Information on these relationships has revealed where there are shared objectives or inconsistencies and constraints to be addressed.

2.2 Plans and strategies have been reviewed and grouped into theme areas. The SA has taken into account the latest guidance available and representations made following the publication of the Scoping and the Interim SA Reports. Many of the themes cut across each other, however to permit an analysis they have been collated under particular headings as set out below. **Please note only the conclusions from the review of relevant plans are contained below; the full review of plans and strategies can be found within Appendix 1**.

Carbon reduction and air quality

2.3 Policies/strategies reviewed emphasise the need to reduce carbon emissions as a key action to mitigate the effects of climate change. Reducing emissions is also a requirement in areas that suffer from poor air quality, such as in Crediton and Cullompton. Reviewed policies also encourage increasing the use of low carbon vehicles as part of a strategy to reduce emissions. These messages must be clearly reflected within the new Local Plan Review. The document should ensure that new development does not unacceptably contribute to poorer air quality, and that opportunities for reducing emissions are incorporated. New development should encourage the use of sustainable modes of transport, such as walking, cycling or the use of public transport. New development should also help to promote the market for low carbon vehicles by ensuring the delivery of electric vehicle charging infrastructure, or other latest technological infrastructure needed for low emission transportation.

Biodiversity and green infrastructure

2.4 The biodiversity and green infrastructure plans and strategies reviewed have at heart the need to conserve and enhance biodiversity. Policies should avoid the deterioration of habitats, and look to preserve, restore and recreate priority habitats, with no net loss in priority habitats. Development should provide net gains in biodiversity where possible, balancing the economic and social needs of development with the objectives of bio- and geo-diversity conservation. Policies should also give consideration to biodiversity enhancing development. The Council should consider whether playing field provision can be provided by private as well as public means. Policies should not adversely affect the integrity of European sites either alone or in combination with other plans as set out in the Habitat Regulations published in 2007, updated in 2010 and again in 2012.

Climate change mitigation and energy

The UK is committed to achieving targets in reducing greenhouse gas emissions in order to tackle climate change, and development has a significant part to play to help achieve these

targets. Planning needs to minimise vulnerability to the impacts of climate change, and support the delivery of renewable and low carbon energy development.

Community and wellbeing

2.5 The reviewed plans and strategies set out the importance of delivering an integrated approach to new development. Building mixed inclusive communities, around a strong neighbourhood centre, with a mixture of housing, economic uses, community uses and services is a priority. Access to services, the creation of safe neighbourhoods and the availability of local green space and quality education and leisure facilities for young people are vital in the creation of healthy, inclusive communities. The provision of accessible, adaptable properties also allows older residents or those with disabilities to remain in their communities, close to family and friends, rather than having to move as their needs change. Residents should be able to influence decisions that affect them and have sufficient space for activity, privacy, circulation and storage in their homes.

Economy and economic development

2.6 The planning system should support the development of strong, sustainable and balanced economic growth. Opportunities for meeting the needs of local and inward investment should be met by facilitating the growth of local businesses, both urban and rural, and providing sufficient land for employment. There should be sustained investment in business and transport infrastructure to improve connectivity. The regeneration of the market towns of the district should be supported with a particular aim to reduce the number of empty shops.

Historic environment

2.7 The planning system should set out a positive strategy for the conservation and protection of the historic environment, considering the value it plays in delivering sustainable, distinctive places that are enjoyed by local people. A balance needs to be struck where the priorities of maintaining and enhancing the built environment are balanced against the district's development needs. The impact on heritage assets on development should be proportionally considered in relation to their significance, with the most important nationally significant assets being given the utmost protection.

Housing

2.8 Nationally the country has not been building enough homes to house its population, and therefore significantly boosting the supply of homes is a priority. The proportion of the population of people above retirement age has increased and there is a need to provide appropriate housing in response. Providing for an ageing population or people with disabilities may need to be addressed through the delivery of homes that can be adapted as peoples circumstances change, or through the delivery of extra care housing. A wide variety of house types should be provided, across a range of tenures to meet the needs of the population. In response to the fact that the lower quartile house prices to lower quartile earnings ratio for 2013 was 8.37 (DCLG 2014) there is a need to provide affordable housing to address long social housing waiting lists and others with a housing need. Such issues are also acutely felt in some of the more rural locations of the district, where house prices may be even higher, and will need to be addressed through affordable housing delivery to meet an identified need. Provision for the needs of gypsies and travellers should be planned for which seeks to balance

their locational, economic and social needs with the protection of amenity and the environment. There is a need for modern homes to be environmentally sustainable, and meet the consumer demands of the population, including provision of sufficient storage space and private outdoor space.

Infrastructure

2.9 The reviewed plans and strategies highlight the importance of delivering infrastructure to meet the needs of existing and new communities. The Government places great importance on the delivery of the following infrastructure as part of ensuring sustainable economic development: transportation, flood protection, communications, research, energy and waste. Community facilities and schools are important infrastructural elements that are required to meet the needs of local communities as part of the delivery of sustainable development. It is recommended that all future allocations are assessed in terms of their impact on the Strategic Road Network and whether they comply with sustainable transport policy objectives and relevant guidance.

Land

2.10 Soil is a natural resource that can be degraded by human action. Planning should take into account the economic and other benefits of the best and most versatile agricultural land. Where significant development of agricultural land is demonstrated to be necessary, poorer quality land in preference to that of a higher quality should be sought. The need to remediate contaminated land should also be a planning consideration.

Landscape

2.11 Devon has a unique and valued landscape, which also contributes towards the tourism attraction of the county. Mid Devon has borders that are adjacent or in close proximity to two National Parks, whilst the Blackdown Hills Area of Outstanding Natural Beauty (AONB) crosses the east part of the district. Planning policies should protect valued landscapes, offering protection and enhancement of the most valued such as National Parks and AONBs. The protection of the landscape needs to be balanced against the challenge of mitigating the effects of climate change through the transition to a low carbon future, particularly achieved through the development of renewables technologies, which are often located in rural areas.

Minerals

2.12 There needs to be a sufficient supply of minerals to ensure the long-term ability to deliver infrastructure and development. The need for a supply of minerals needs to be balanced with the priority of protecting the environment. Planning for minerals extraction does not fall within the remit of Mid Devon District Council, being instead undertaken by Devon County Council. However, the consideration of the environmental impact of materials used in buildings and the desire to promote locally sourced materials is a district issue, as is the effect on local communities who are in close proximity to mineral workings. Minerals resources should also be protected from the sterilisation by development where these minerals are needed in the long term.

Rural areas

2.13 The population in rural areas has grown at a greater rate than urban areas in the last decade. Rural businesses make a substantial contribution to the economy and should be supported to grow. Agriculture remains an industry that has faced many challenges in recent decades and such enterprises should be supported to diversify in order to benefit the rural economy. Rural areas experience social issues such as poor access to services and facilities, whilst the growth of their economies may be hampered by poorer broadband speeds.

Transport

2.14 Reducing carbon emissions produced as a result of transportation is a national priority. This can be achieved by increasing opportunities for the use of sustainable modes of transport, such as public transport, walking and cycling; through the delivery of opportunities to increase the use of electric vehicles and improving the connections between various modes of transportation; improving the condition of the local transport network and protecting existing transportation assets. Ensuring safe and sustainable transport options are available to communities is also a priority.

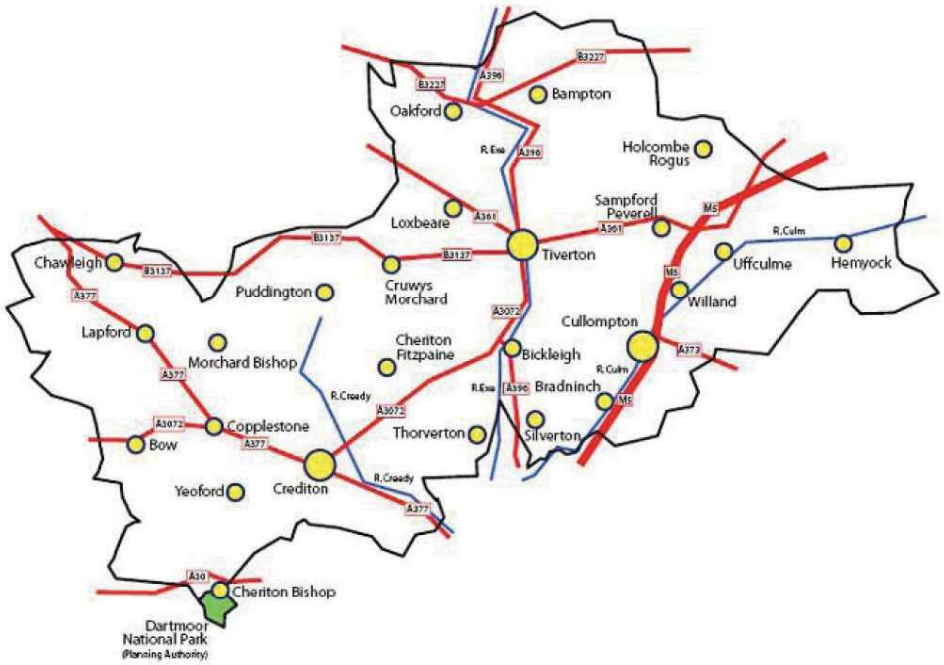
Waste

2.15 National waste priorities are to protect human health and the environment whilst ensuring the delivery of sustainable waste management. Reducing the carbon footprint of waste will also contribute towards tackling climate change. New development should contribute to sustainable waste management, through the application of the waste hierarchy where disposal is the last resort, instead prioritising re-use, recycling or recovery.

Water

2.16 Managing flood risk and the effects of climate change is a key European, national and local priority, particularly as Mid Devon has suffered serious flooding in the past. In particular new housing and commercial development should incorporate measures to improve water efficiency and reduce surface water run-off which can contribute to flooding. Water bodies should be protected from the effects of pollution, and there should be no reduction in their quality or status. Consideration should be given to the Water Framework Directive, and the objectives of the South West River Basin Management Plan when planning for development which could impact on the water environment.

Mid Devon's baseline characteristics and future changes



2.17 The collection of baseline data is a key component of the SA process to help establish a picture of the District. The information collected provides a basis for predicting and monitoring effects and helping to identify sustainability problems. The information collected is drawn from a mixture of sources from national plans and strategies and combined with local monitoring data.

2.18 Much of the information represents generic data about the district, rather than specifically generated information in relation to the development of the Local Plan Review. Some of it will have been relevant in the production of previous local development documents, whilst other data will have been updated more recently. Some information may not be up to date, but may be the most recent available. The information provided covers a broad range of environmental, social and economic matters which collectively understood help to assess sustainability.

Location

1.1 Mid Devon is an inland area in the south west of England, lying roughly equidistant between the Bristol and English Channel coasts. The Strategic Road Network provides good connections to Tiverton and Cullompton and access to larger urban areas outside the district including Exeter (population 117,800) and Taunton (63,000) which are just beyond the southern and eastern boundaries of Mid Devon and provide additional opportunities for work and higher education. Significant transportation routes such as the M5 motorway and the Great Western Rail Line provide good connections to the rest of the UK including London.

1.2 The district is one of the most sparsely populated local authority areas within England and Wales, with a large number of residents living outside of the three largest towns. The principal concentration of people is in the eastern part of the district, where the market towns of Tiverton and Cullompton lie within 6 miles of each other. Crediton is the largest settlement in the west of the district.

Physical characteristics (including landscape)

2.19 The district of Mid Devon covers an area of 353 square miles (914 sq. km) in the heartland of Devon. It lies between Dartmoor, Exmoor and the Blackdown Hills. From the centre of the district, the north and south coasts of Devon are each about 30 miles away. The landscape's strong rural characteristics complements a historic sense of place, with medieval field patterns interspersed within the productive agricultural landscape, broken by tracts of internationally important Culm grasslands and scattered traditional settlements typically associated with Devon. The majority of Mid Devon's settlements are nestled within the folds of the landscape, with many small historic settlements containing thatched cottages and ancient churches.

2.20 The Mid Devon district forms the heart of the Devon countryside, linked to the south coast by the River Exe with its valley and surroundings. Most of the district's rivers drain southwards in steep-sided valleys into large expansive floodplains. The market towns of the district have typically evolved as riverside settlements. The intricate course of the River Exe is the most

defining landscape feature in Mid Devon, providing a continuous thread flowing from the northern extremities of the district down to the south near Thorverton. To the east the Blackdown Hills have a unique geology and provide an often isolated and valued distinctive rural landscape.

2.21 The Culm Valley to the east is a low lying flat prosperous agricultural area, with good soil fertility. The north and northwest of the district is a high flattish landscape with a rather unsheltered windswept appearance, formed by the Culm Measures, so called for its underlying thin bed of coal known locally as 'Culm'. The farming hinterland to the north of Crediton, often referred to as the Mid Devon farming belt, has all the typical elements that make up the distinctive Devon landscape, with its varied patchwork of irregular shaped fields with green pastures.

2.22 Natural England has divided England into Natural Character Areas, with Mid Devon falling into three distinct areas: the Culm, the Devon Redlands and the Blackdowns. The Mid Devon Landscape Character Assessment provides further more localised characterisation. The Devon Redlands has a very strong, unified character. The underlying red sandstone and consequent red soil dominate the landscape through ploughed fields, cliffs and exposures, and are visually evident in the traditional stone and cob farmsteads, hamlets and villages that are scattered across the area. Not only does the soil visually characterise the area but its fertility also makes it the agricultural heart of Devon.

Biodiversity and green infrastructure

2.23 The varied nature of Devon's geology and landform has led to a considerable range of biodiversity. There are various protected species found in Mid Devon, such as woodlark, bats and dormice. In comparison with the rest of Devon, Mid Devon has relatively little land designated as being of national importance and no designed or candidate European sites. Within Mid Devon there are 12 Sites of Special Scientific Interest (SSSI), three local nature reserves and two nature reserves managed by Devon Wildlife Trust. Mid Devon has over 8 sq. km. of ancient woodland. The district supports a range of important wildlife including over 200 County Wildlife Sites and Regionally Important Geological Sites.

2.24 To the east of the district lies the Blackdown Hills AONB, this is highly valued not only for its visual qualities but also for its geology, biodiversity and human heritage. The Blackdown Hills support species and habitats such as purple moor grass and rush pastures that are in rapid decline in the UK. The North Devon Biosphere Reserve transition area also covers part of Mid Devon.

2.25 Changes in wildlife populations and habitat have occurred throughout the last century and show a general trend of decline. Many of Devon's habitats are small and fragmented and their health is threatened due to a range of issues. The main threats to biodiversity include environmental pollution, land use change, fragmentation and invasive species introduction. These pressures are likely to continue and biodiversity may also be affected by climate change and recreational pressure. Hedgerow removal and unsympathetic conservation of rural buildings can impact on important species identified in the Devon Biodiversity Action Plan.

2.26 In particular the RSPB's State of Nature Report (June 2013) stated that 60% of species on which they hold data are in decline, whilst 31% have declined strongly. Half of the species assessed

have also shown strong changes in abundance or distributing, indicating that recent environmental changes are having a dramatic impact on the nature of the UK's land and seas. In particular species with specific habitat requirements are faring worse that generalist species that are better able to adapt to a changing environment. Action needs to be taken to save nature for its intrinsic value and for the benefits it brings to us that are essential for well-being and prosperity.

2.27 Natura 2000 sites, which are hierarchically the most important sites for biodiversity, are protected under European legislation. Natura 2000 sites include Special Areas of Conservation (SACs) designated for species and habitats and Special Protected Areas (SPAs) designated for birds. A Habitat Regulations Assessment (HRA) has been undertaken for the Local Plan Review which considers the impact of the Plan on Natura 2000 sites. Consideration is also provided to potential SPAs, candidate SACs, Sites of Community Importance and Ramsar sites. For ease of reference, these designations are collectively referred to as European sites despite Ramsar designations being at the international level. Whilst there are no European sites within Mid Devon, there are eleven within 10km of the district's boundary. The eleven sites are as follows:

- East Devon Pebblebed Heaths (SAC)
- Culm Grasslands (SAC)
- South Dartmoor Woods (SAC)
- Home Moor and Clean Moor (SAC)
- Dartmoor (SAC)
- Exmoor Heaths (SAC)
- Quants (SAC)
- Exmoor and Quantock Oakwoods (SAC)
- Exe Estuary (SPA)
- East Devon Heaths (SPA)
- Exe Estuary (Ramsar Site)

2.28 The Culm Grasslands site is considered to be at greatest risk from development, due to its location on the A361 and proximity to the Mid Devon boundary. The A361 is the main route into North Devon from the M5 motorway, providing a vital tourism link as well as a certain amount of commuter and shopping traffic in either direction. Natural England has advised that any development that encourages through-traffic may impact on the SAC through air pollution. This has been considered by the HRA for the Local Plan Review which concludes that the development proposed in the Local Plan Review alone will not result in adverse effects on the integrity of European Sites around Mid Devon. However uncertainties exist regarding the potential for the North Devon and Torridge Local Plan to have significant effects on the integrity of the Culm Grasslands SAC as a result of increased air pollution. Therefore it is not yet possible to conclude that there will be no likely significant effects as a result of implementing the new Mid Devon Local Plan Review in-combination with the North Devon and Torridge Local Plan.

Further work has been commissioned to determine this impact; the Habitat Regulations Assessment and this SA will be updated to reflect the latest evidence before submission.

2.29 There are many other elements that form part of the district's green infrastructure. These include 476 miles of Public Rights of Way and two regional walking routes (Two Moors Way in the west and Exe Valley Way from North to South). These routes are used recreationally by walkers, cyclists and horse-riders, but many rights of way provide short enough connections through and between towns and villages that they are realistic choices for people travelling to and from work and school.

2.30 The Environment Agency note that the local water environment performs a valued role in contributing to well-functioning ecosystem services. In Mid Devon there are a variety of rivers running through the district, including the Exe, Culm and Creedy, as well as a number of small contributory streams. These play a role as habitats and ecological networks for local biodiversity. The same applies to the Grand Western Canal, a County Wildlife Site.

Climate change mitigation and energy

2.31 Forecasting the future impact of climate change is particularly challenging, though there is extensive scientific evidence that the world's climate is changing. The UK Government has stated that if the global average temperature rises more than 2^{o}C above pre-industrial levels, significant negative impacts of climate change will be more likely and the cost of managing them will rise sharply. To have a 50% chance of keeping climate change to within 2^{o}C of pre-industrial levels, global greenhouse gas emissions need to peak before 2020 and then decline steeply. Evidence suggests at present emissions are continuing to soar. On 10 May 2013, concentrations of CO^2 in the atmosphere passed 400 parts per million, the highest level in 50 years of data collection, and a peak not estimated to have been experienced for three-five million years (the Pliocene period, a time when the arctic was ice-free and sea levels were 40 metres higher than today).

2.32 There are many risks associated with increasing climate change. These include threats to agriculture as a result of higher demand for water resources, reduction in productivity in farming or forestry land as a result of drought or conversely as a result of flooding. Businesses are likely to be affected by increased risk of flooding, competition for water, energy and materials and the disruption of transport networks and communication links. The flooding and resultant disruption to the Great Western Railway line near Stoke Canon in December 2012 highlights the potential impact on the region. The natural environment could be affected resulting in increased concentrations of pollutants in low water levels or reduced river flows damaging freshwater habitats and other ecosystem services; warmer rivers, lakes and seas impacting on biodiversity; flooding impacting on key habitats; ocean acidification affecting species and habitats and changes in seasonal events.

2.33 These effects will be experienced at a time when national energy reserves are declining. Much existing energy infrastructure is in the process of closing as it reaches the end of its operational life, whilst domestic fossil reserves of oil and gas are declining. The amount of spare electricity capacity in the system could fall from around 6% (2013) to around 4% in 2015/16, before recovering to around 8% by 2018/19 (Statutory Security of Supply Report, 2013).To ensure there is sufficient energy to meet the UK's energy needs, and to mitigate the impacts of climate

change there is a need to increase our reliance on low carbon technology. The region is rich in renewable energy resources and Devon has the highest installed renewable energy capacity of any county in the South West.

2.34 Whilst Government pays subsidies in the form of tariffs for renewable energy and maintains a positive approach to moving to low carbon energy sources, pressure for such developments within Mid Devon is likely to increase – particularly given the district's location (i.e. annually more sun in the south, and more wind as the area is exposed to the prevailing south westerly winds). However, this has implications for conflicts that may arise as a result of landscape impacts, particularly given the proximity to National Parks and the Blackdown Hills AONB. Historically, large-scale renewable energy developments have often been vocally opposed by local communities.

Mitigating the effects of climate change will also require the use of lower carbon resources in the construction industry, particularly as part of the development of houses and other buildings. Buildings will need to use fewer resources through the use of materials with a lower lifecycle carbon use, whilst simultaneously increasing energy and resource efficiency. Building regulations have been gradually amended to improve the energy efficiency of homes which will have affected the carbon output of recent new builds nationally. As the Local Plan Review has progressed, Central Government have consulted on a 'Housing Standards Review' (2013) which set out the range of standards to be considered. Since this consultation, Government have produced a nationally described Space Standard which has been incorporated into Mid Devon's Local Plan Review, under Policy DM13: Dwelling sizes.

Population and housing

2.35 The release of data from the 2011 Census has shed new light on population trends in Mid Devon. In combination with other data sources, this helps to build a picture of changing household composition and long-term needs. The population according to the census is 77,750, an increase of approximately 11% upon the 2001 figure, a rate of growth that has risen faster than the rest of Devon, the South West and England.

2.36 The average household size in Mid Devon is marginally smaller at 2.35 persons than the England average of 2.36 persons. The median age of the population in Mid Devon rose from 41 in 2001 to 44 in 2011. In comparison the median age in England and Wales climbed from 37 to 39 over the same period. Whilst overcrowding has risen slightly to 4.4% from 4% between 2001 and 2011 it remains well below the figure for England and Wales of 8.5%. The 2011 Census also showed that 20.3% of households include a member with a disability.

2.37 The Council has commissioned a new Strategic Housing Market Assessment (SHMA) in partnership with some of our neighbouring district councils. This will provide definitive, up-to-date information on the level of housing need and demand across the Exeter Housing Market Area. Local planning authorities are required to cooperate with each other on strategic planning matters.

Community and wellbeing

2.38 The health of people in Mid Devon is generally better than the England average. Deprivation is lower than average, however about 12.5% children live in poverty. Life expectancy for both men and women is higher than the England average (Mid Devon Health Profile, 2014).

However, life expectancy is 4.9 years lower for men in the most deprived areas of Mid Devon than in the least deprived areas. Over the last 10 years all-cause mortality rates have fallen. About 16.9% of Year 6 children are classified as obese, whilst levels of teenage pregnancy and smoking in pregnancy are lower than the England average. Priorities for Mid Devon include addressing healthy weight in childhood, cardiovascular skin disease, skin cancer prevention, alcohol use and smoking. The Council's Green Infrastructure Plan also recognises that access to public rights of way, playing fields and recreational open space is an essential aspect of public health and wellbeing.

2.39 Despite the impact of the recession, incidents of recorded crime have continued to fall year on year since 2007/08. Furthermore, the area is one of the lowest for recorded crime within Devon and Cornwall.

Economy and employment

2.40 The majority of Mid Devon's employment falls within the service sector, which includes occupations where knowledge and time are offered to improve productivity. Examples include transport and distribution, retail and services such as accountants or building surveyors. This sector accounts for 74.8% of Mid Devon employment (Economic Trends Report, August 2014).

2.41 Overall the net commuter flows of Mid Devon District show that more people commute out of Mid Devon than those that in commute with a strong 'pull' from neighbouring urban areas, especially Exeter. The district profile produced for the Local Economic Assessment (2012) found that there is a high level of self-employment within Mid Devon, and the district is above the Devon average for business density (number of businesses per working age person) and business start-ups. While school-level attainment is above average for the county, this does not translate to a highly skilled resident workforce, implying that high-attaining school leavers are not staying in Mid Devon.

2.42 The Council commissioned an Employment Land Review in 2013, to assess the scale and nature of demand for employment land and premises in the District. The report concludes that the evidence suggests that the Council should consider rationalising its employment land supply through review of planning policies. It recommends that the Council plan for 30-40 hectares of employment land over a twenty year period, equating to approximately 140,000 square metres floorspace.

2.43 The Council commissioned a Retail Study in 2012, to assess both demand and the capacity of the local catchment areas to support different sorts of retail growth. The report highlighted that Mid Devon's market towns are in a vulnerable position, similar to other small-medium sized towns across the country. The study identifies common trends, such as national retailers consolidating their businesses in larger regional centres, while internet shopping also takes trade away from town centre shops. Retail forecasts predict weak growth in spending, resulting in possible reductions in town centre retail space, with these effects potentially being most acutely felt in Crediton and Cullompton. Out-of-centre retail development may be most attractive to developers due to lower land values but may harm the existing town centres. Regeneration of the town centres, particularly as Tiverton is in receipt of government regeneration funding as part of the 'Portas Pilot' programme, is a priority, but one that faces significant challenges. Tourism also represents a small but important sector within the district.

Devon is a popular destination for domestic tourism, though traditionally Mid Devon has not been a significant recipient of tourism spend as visitors bypass the district en route to other parts of the county, particularly those areas closer to the coast. Previously, tourism development focused on the small scale provision of visitor accommodation, often on farms that were diversifying their activities. A Mid Devon Peer Challenge undertaken in early 2013 highlighted tourism as an economic area on which the district could capitalise. Further detail on the type of tourism offer that should be pursued is presented in the Tourism Study (2014). The Tourism Study identifies a number of areas where opportunities exist to encourage tourism in the District and proposes a multi-pronged approach focussing on: marketing market towns and surrounding areas; developing the accommodation offer; maximising the natural offer; catching passing tourists and creating fun activities for children to attract family trips.

Historic environment

2.44 Mid Devon is a district with a rich historic and cultural heritage. There is a wealth of historic buildings and features throughout the district, with over 2680 listings of buildings, bridges and milestones. The district has three historic parks and gardens of national importance – Knightshayes, Bridwell Park and Shobrooke Park, with an additional 16 of local value. The area also has 51 conservation areas and 49 scheduled ancient monuments, including castles, roman forts, stone crosses, bowl barrows, a henge, abbey, ring ditch, iron age earthworks, camps, a Romano-British villa, Neolithic causewayed enclosure and a hillfort. In addition there are a wide range of archaeological remains which are not scheduled.

2.45 The three main towns of the district all have a particular historic importance. Tiverton has its origins in a ford across the Rivers Exe and Lowman and has an attractive historic centre and a rich legacy of buildings of all periods. Crediton is a historic market town with medieval burgage plots that can still be discerned in the south side of the High Street. Cullompton is an old town with two Grade I Listed properties and some ninety Grade II. However, whilst the heritage of the district is critical to local character, there is no comprehensive coverage of documents that provide an aide to protection. Of the 51 conservation areas, only 13 have conservation area appraisals (CAAs) and five have conservation management plans. Whilst the three main towns and a number of the larger villages are all covered, other villages and smaller settlements within the district have no coverage. Production of additional appraisals has slowed in recent years, with only two conservation areas adopted in 2003 and one new conservation area and associated appraisal and management plan adopted in 2014, as well as a total of five revisions to boundaries in the last 10 years. Cullompton has an Article 4 direction in place, which offers a degree of protection over and above that of the conservation area designation. Plans to put in place a similar directive in Bradninch were discussed but have not been adopted. The Heritage at Risk Register (2014) identifies 24 Heritage assets at risk within Mid Devon District. These range from conservation areas to Listed Buildings and Scheduled Ancient Monuments.

2.46 There are also potential conflicts between the protection of heritage assets and mitigating the impact of climate change. In particular this is played out where home owners wish to install renewable energy features, such as solar PV arrays on roofs in a conservation area or on a listed building. Such developments may not positively contribute to local character or may reduce the significance of the heritage value of a building. This represents a potential conflict of sustainability objectives.

Resources

2.47 Energy is a crucial consideration in the functioning of the economy, and one area of concern is the future of non-renewable sources of energy, particularly oil. There has been much discussion about the notion of 'peak oil' in recent decades, the theory being that production of oil will peak in coming decades, with demand outstripping supply. Whilst there is academic disagreement on the reality of the peak oil theory, there is growing consensus that the age of cheap oil is coming to an end. Declining production of existing older oil fields will exacerbate production problems. As a result, more than two thirds of current crude oil production capacity may need to be replaced by 2030, simply to prevent production from falling. This is likely to be extremely challenging, and will likely result in necessary demand reduction and sourcing alternative sources of energy supply. Local effects of peak oil will include increased costs for fuel, with significant rises already having taken place, affecting motor vehicle users, but also passengers on public transport facing higher fare costs. As the government seeks to deliver a balanced future energy supply, there is likely to be greater desire to deliver renewable energy developments, with pressure particularly felt in rural areas for onshore wind and solar farms.

2.48 There is also uncertainty over the future supply of phosphorus, which is an essential ingredient in fertilisers, and plays a critical role in contributing to modern agricultural production. Some researchers have predicted that phosphorus reserves are expected to be completely depleted within 50-100 years, though this is not universally agreed. Such reductions will have a significant impact on farming productivity, land use and food supply.

2.49 Water is essential for human life and to sustain a diverse and thriving water environment. It is important to our economy as an essential requirement for industry, power generation, commerce and agriculture. Over the next 30 years, there will be increasing pressures from rising populations and associated development. Looking further ahead, the impact of climate change could have a major impact on water that will be available for all uses.

2.50 Building on previously developed land, "brownfield land", avoids the need to use greenfield land for new housing. In recent years, Mid Devon has developed a high proportion of new housing and employment on brownfield sites, with totals of 34% of new or converted housing and 69% of new employment development in 2012/13. This trend is not likely to continue as previously developed land is a finite resource, which is relatively scarce in a rural setting such as Mid Devon. Government policy encourages the effective use of brownfield land, provided that it is not of high environmental value; however this approach is less strict than previous national policy. Conversely, national policy now provides less support for the long-term protection of employment land for development for alternative uses. This could mean existing brownfield land being used for housing, potentially reducing the overall amount of greenfield that needs to be allocated.

2.51 Government guidance also states that planning should consider the economic and other benefits of the best and most versatile agricultural land. A national grading system has been in place since the 1960s which classifies the quality of agricultural land based on factors based on soil, climate and site. At the time of original mapping the breakdown of grades within Mid Devon was as follows:

Grade	Percentage land coverage

1	3.48%
2	11.01%
3	64.44%
4	19.86%
5	0.05%
Non-agricultural	0.28%
Urban	0.89%

Source: MAFF (1966)

Individual sites were surveyed in more detail using the revised 1988 guidelines between 1989 and 1999. In Mid Devon these areas fell in the following settlements, Tiverton, Cullompton, Crediton, Burlescombe, Copplestone and Willand. The latest agricultural advice is used to assess sites where available, however a full resurvey has not been undertaken on a district-wide basis since it was originally commissioned. It is unlikely to have changed significantly despite the growth in urban areas. The best and most versatile land is defined as grade 1, 2 and 3a in the NPPF and it is noted that local planning authorities should take into account the economic and other benefits of the best and most versatile agricultural land. Where significant development of agricultural land is demonstrated to be necessary, local authorities should seek to use areas of poorer quality land in preference to higher quality.

Minerals

2.52 Devon is also a county with valuable mineral resources. The county for example, along with Dorset and Cornwall, is the only source in the UK of ball and china clay. Responsibility for minerals planning is a function of Devon County Council. Mid Devon is the setting for a number of locations of mineral extraction. Strategic mineral sites producing minerals of national importance or making a significant contribution to delivering sub-regional aggregates include the winning of limestone at Westleigh.

Rural areas

2.53 National government statistics classify Mid Devon as a 'Rural-80' based on the location of the local population. This statistic refers to the fact that over 80% of the population are resident in rural settlements (including those with urban areas with between 10,000 and 30,000 population regarded as 'larger market towns'). Classifying Mid Devon as a 'Rural-80' local authority puts it in a category of the most rural local authorities within the UK.

2.54 Rural businesses are a key element of the local economy. There is a growing trend for individuals to set up their own businesses, particularly in rural areas where areas such as Mid Devon can provide a high quality of life and where transport costs and distances can encourage home-working. Broadband access and speeds can be a key issue for rural-based businesses. A programme to connect Devon and Somerset with superfast broadband is underway which will result in speeds of at least 24Mbps to at least of 85% of homes and businesses by 2015. However, many rural areas currently receive less than 2Mbps at present, which may hinder the start up or expansion of rural businesses.

2.55 Access to services is also an issue for rural areas. Statistics for the whole of Devon show a decrease in the number of households within good transport access to key services or work. Levels of public transport providing services to villages in Mid Devon have shown a decrease

since 2006. In particular the number of daily services to these settlements has shown a steady decline across this period.

Transport and air quality

2.56 As a rural area, Mid Devon has a high dependency on the car, particularly as public transport provision and coverage is far from extensive, and has shown signs of contracting. These factors are reflected in the level of car ownership, which has increased at both national and local levels. The average household in Mid Devon now owns 1.47 cars, as opposed to 1.33 at the time of the previous census. The percentage of households owning 2, 3 and 4 or more cars has all increased, whilst the share of those who do not own a car has fallen. In particular, the ratio of cars owned per household in Mid Devon has continued to grow at a consistent rate whilst growth in the national level has shown signs of levelling off. This has led to inappropriate or anti-social parking, rather than a reduction in car ownership. Future developments should make suitable provision for parking in order to reflect the rural nature of the district and levels of ownership. Neither does it appear that higher fuel costs have had an effect on car ownership, though high levels of ownership do not always translate into high levels of usage.

1.3 High levels of car ownership and hotspots of poor local road infrastructure have impacted on local air quality. Both Cullompton and Crediton were designated as Air Quality Management Areas in 2006 and 2004 respectively. Principal actions to address the excessive levels of Nitrogen Dioxide and particulates in the air include the development of the Crediton Link Road and two relief roads within Cullompton. Work to provide the Crediton Link Road was completed in 2014, however to date there has been no progress on new roads in Cullompton.

1.4 The M5 motorway through Mid Devon generally functions well but there are junction capacity issues at Junction 27 (J27) and Junction 28 (J28). Improvements are planned to both junctions but further works will be required to accommodate the level of growth proposed in the Local Plan Review. Mid Devon District Council will work closely with the Highways Agency (or any successor) to help ensure the continuing functionality of the M5. The Great Western mainline railway runs north-south through the district and has an hourly high speed train service between Bristol and Exeter, to and from London and an hourly cross country service to and from the midlands and the north.

1.5 Furthermore, the Tarka line, between Exeter and Barnstaple, provides hourly local services. There is an opportunity to open a station at Cullompton to serve Taunton and Exeter commuters. Key airports serving the area are Exeter and Bristol, offering scheduled flights to a number of domestic and European destinations as well as charter traffic.

Waste

2.57 National policy on waste prioritises reduction, re-use or recycling in order to prevent waste going to landfill. Local authorities will experience increasing costs as a result of waste going to landfill, which will need to be reduced by using alternative methods of waste management, particularly given the severe pressures that are on Council finances as a result of Central Government funding cuts. There are also implications for climate change as a result of how waste is managed. In many cases carbon acts as a good proxy for the overall environmental impacts of waste: generally speaking, the higher up the waste hierarchy waste is treated, the

smaller the greenhouse gas impacts. Devon County Council has the duty as the waste planning authority and they are in the process of adopting the Devon Waste Plan 2014.

Water

1.6 Mid Devon has suffered serious flooding in the past, and the risk of flooding is likely to increase in the future as a result of climate change. The State of the Environment Report (2014) produced by the Devon Local Nature Partnership noted that the economic damage from flooding in Devon, Plymouth and Torbay currently costs £81m per year. This is estimated to rise to £1b per year in 2100 if no further protection measures are implemented.

2.58 Forward planning must take account of this risk to ensure that new development is sustainable. Winter rainfall is predicted to increase by 15-30% by the 2080s as a result of climate change, with a concomitant 20% rise in peak river flow. Impermeable surfaces of buildings, roads and pavements limit infiltration and increase the volume and rate of surface water runoff. Future development may increase the area of impermeable surfaces unless a sustainable approach to water management is adopted that promotes sustainable urban drainage (SuDs) and improved water efficiency within buildings. Government are currently consulting on changes to national policy on delivering SuDs. Subject to the outcome of this consultation, any changes to planning policy would come into force spring 2015. Proposals include applying a requirement that SuDs are provided to schemes of 10 or more homes, giving scope to decision-makers to give increased weight to the provision and maintenance of SuDs and rejecting applications that fail a policy requirement to normally deliver SuDs first over conventional drainage. A Strategic Flood Risk Assessment was commissioned in 2014 and considered the Local Plan Review and potential allocation sites. The conclusions from this assessment have been used in determining the strategic and site-specific options in the Local Plan Review to help steer new development to areas with the lowest probability of flooding.

Sustainability issues

2.59 The review of policies, plans and programmes including environmental protection objectives and the baseline information have been reviewed. Key sustainability issues have been identified and inform the sustainability objectives which form the basis of the framework to appraise the Local Plan Review strategy and policies.

Key sustainability issues	
Natural Environment	Biodiversity levels are continuing to fall, often dramatically for some species. There is potential for negative impact on the Water Framework Directive status of waterbodies across the district as a result of development.
Built Environment	Some heritage assets are at risk. Some climate change objectives can conflict with the conservation of the area's historic environment, particularly in the installation of renewables technologies that may impact on heritage assets.
Climate Change and Flooding	There is pressure for the installation of renewable energy developments to meet energy shortage however this may conflict with other objectives e.g. built environment. There is an

	increased risk of flooding as a result of climate change.
Resource Use	There are high levels of best and most versatile land across the district. There may be a conflict between protecting this resource and the need for development across the district. There are limited brownfield sites and therefore pressure to develop primarily on greenfield sites. There is also a need to avoid disposal of waste instead of prioritising re-use, recycling or reduction.
Economic Growth	There are higher levels of out-commuting than in-commuting, especially to Exeter and the potential loss of employment within Mid Devon. There is declining town centre health with town centre regeneration having the potential to be affected by any new out-of-centre development.
Housing	There has been a large population growth within the last decade and demographic household change leading to the need for new housing. Houses have not previously been constructed of a sufficient size to meet the needs of the modern family. There is a continued need for affordable housing.
Community Health and Wellbeing	Mid Devon has small areas of social deprivation within Tiverton, Cullompton and some of the remote rural areas (including high levels of child poverty). Access to services and facilities for rural communities has worsened and may continue to do so. There is a low retention of high-attaining school leavers. There are issues around traffic congestion and poor air quality within Crediton and Cullompton.
Infrastructure	There is a high dependency on the car across the district, with levels of car ownership having grown and continuing to grow. Rural self-employment or small business start-up is a growing sector, however this may be constrained by poor broadband speeds.

The likely Evolution of the State of the Environment without Implementation of the Local Plan Review

2.60 Consideration has been given to the likely evolution of the state of the environment in Mid Devon if the Local Plan Review was not implemented, as required by the SEA Directive Annex 1(b). The current Local Plan 2006-2026 effectively provides the 'business as usual' position. The assessment below therefore identifies what the situation would be like if the Local Plan Review was not prepared. Development proposals would still be considered through planning applications, guided by National planning policy and other legislation. Without the

development plan to take a strategic overview of development needs and opportunities for enhancement taking the strategic plan for development up to 2033, proposals later in the plan period (post 2020) would be considered on an ad hoc basis. This would result in uncertainty over the likely levels of growth in the future (and its location) beyond that which already has planning permission.

Current Trend	Likely Evolution without the Local Plan Review
Natural Environment	
Changes in wildlife populations and habitat that have occurred throughout the last century and show a general trend of decline. The main threats to biodiversity include environmental pollution, land use change, fragmentation and invasive species introduction.	Significant levels of growth are required to meet the projected population growth in Mid Devon. Without a strategic plan, the location and level of development would be on an ad hoc basis and may harm wildlife populations and habitats without appropriate mitigation.
Built Environment	
There are 51 Conservation Areas within Mid Devon; currently 13 have appraisals and five have management plans. The Heritage at Risk Register identifies 24 heritage assets at risk. There are potential conflicts between the protection of heritage assets and mitigating the impact of climate change, for example, through renewable energy features on listed buildings.	Developments would need to follow national policy which provides protection for designated heritage assets (such as Listed Buildings) and undesignated heritage assets (such as archaeological sites or locally listed assets). However, without the Local Plan Review, protection would not be afforded to potential heritage assets identified through planning applications until such time as they were added to the appropriate list. This may result in the destruction or removal of the asset before it has suitable protection, resulting in the loss of currently unknown heritage assets which are often irreplaceable.
Climate Change and Flooding	
The district has a long history of flood events, with the main source of flooding being from fluvial sources. There have also been various incidents of localised flooding including a canal breach along the Grand Western Canal during the winter of 2012.	Incidents of flooding are expected to increase as a result of climate change. The flood zones within the District may grow, resulting in fewer viable locations for development. Without the Local Plan Review, development proposals will be considered on an ad hoc basis and therefore the application of the sequential approach to direct development away from areas at highest risk would be limited. The necessary infrastructure would not have investment from development contributions leading to development in unsustainable locations.
Resource Use	
Mid Devon is made up of approximately 15% of grade 1 and 2, 65% grade 3 and 20% grade 4 and 5 agricultural land.	The projected population growth up to 2033 requires development beyond that which is allocated in the existing Local Plan. Without this strategic plan consideration of options for development would be limited with proposals considered on an ad hoc basis. This would limit the opportunities to use areas of poorer quality

	land in preference to higher quality. Higher levels of development may be located in areas of the best and most versatile land.
Economic Growth	
There are low levels of in commuting and strong 'pull' from neighbouring urban areas. The existing Local Plan provides for 300,000 square metres of employment and 10,000 square metres of retail floorspace. Evidence from the Employment Land Review (2013) suggests that employment land supply should be rationalised.	National policy states that planning policies should avoid the long-term protection of sites allocated for employment use where there is no reasonable prospect of a site being used for that purpose. In view of the shift of policy emphasis in the NPPF there is a need to rationalise the scope of employment land allocations in the District to rebalance the employment land portfolio. Without the Local Plan Review evidence suggests that it is unlikely that the market will support the delivery of all the employment land allocations made in the current Local Plan in addition to current commitments.
Housing	
Census data reveals that the rate of population growth in Mid Devon from 2001-2011 has risen faster than the rest of Devon, the South West and England. Existing plans allocate sufficient land to meet strategic targets up to the year 2026.	Without the Local Plan Review (which plans for development up to 2033) development would remain in sites which are allocated and through windfall, until the five year land supply cannot be demonstrated. At that point, development would occur on an ad hoc basis. This may lead to development in unsustainable and unsuitable locations.
House prices in Mid Devon are above the averages for Devon and affordability remains a critical issue.	Without the Local Plan Review policy, support for affordable housing will become weaker later in the plan period which therefore would result in less affordable housing being provided as part of new development schemes.
Community health and wellbeing	
The health of people in Mid Devon in general is better than the England average. However the population profile is increasing in age and a priority for Mid Devon is addressing healthy weight in childhood. The Council's Green Infrastructure Plan recognises that access to public rights of way, playing fields and recreational open space is an essential aspect of public health and wellbeing.	Without implementing the nationally approved 'access standard' as part of the governments Housing Standard Review, opportunities to provide for accessible and convenient accommodation which is capable of adaptation would be limited. Care homes within the additional allocation policies would not be provided for and standards for public open space provision would not be sought. This may result in limited housing appropriate for older people and a lack of open space provision.
Infrastructure	
Mid Devon residents have a high dependency on private vehicles	High levels of car use will increase levels of air pollution and noise disturbance. The necessary infrastructure would not have investment from development contributions, leading to increased congestion on Mid Devon's road network.

3 Sustainability Appraisal Methodology

Developing the plan and options

3.1 This is the third consultation that has taken place as part of the preparation of the Local Plan Review. The initial consultation, undertaken during July and August 2013, set out the scope of the review and the issues facing the district, and sought feedback on the broad direction of development for the district over the next 20 years. That consultation included no policies or sites. The second consultation undertaken during February and March 2014 (Options Consultation) set out the options available to the district, including a range of strategic options in terms of where growth is focused over the next twenty years. A range of sites across the district where this growth could be located were also been included. A scoping and interim SA accompanied the two previous consultations on the Local Plan Review which provided an assessment of the sustainability impacts of the scope of the plan and policy options.

Local Plan Review: Scoping Report

3.2 Natural England and the Environment Agency made a number of recommendations about the content of the Scoping Report. These have been incorporated into the SA. In summary, their responses stated the following:

- The document should include and take account of National Character Areas, which are currently being revised by Natural England (links to the relevant profiles were provided)
- Environmental issues should be addressed at a strategic level, with a holistic approach being applied to all biodiversity and green infrastructure needs
- The plan should recognise the importance of land management and its implications for the ecological quality and status of a river
- Access to open green space should be referenced in relation to community and well-being
- Reference to water as a resource should be included
- A Strategic Flood Risk Assessment should be undertaken in parallel with the revised Local Plan Review. Information regarding the Water Framework Directive status of waterbodies in Mid Devon should be included, with reference to the South West River Basin Management Plan
- The framework of indicators should be updated to consideration of impacts on the following indicators: 'resilience to climate change' and 'water resources'
- The Mid Devon Green Infrastructure Assessment, the South West River Basin Management Plan and the Water Framework Directive should be added to the list of relevant plans and programmes

Local Plan Review: Options Consultation

3.3 The Local Plan Review: Options Consultation report contained a range of strategic policy options and sites. It contained more sites than the Council needed to allocate. Some of the sites were listed as preferred sites. These were stated as preferred as they are already allocated in the current Local Plan, and therefore have been subject to public consultation and Examination in Public as part of the process for adopting the Allocations and Infrastructure

Development Plan Document (AIDPD) in 2010. The sustainability of these sites was also previously subject to a SA alongside the preparation of the AIDPD document. Though stated as preferred in this second consultation, they were still subject to ongoing SA and consultation as part of the process of preparing the Local Plan Review.

3.4 During the Options Consultation the Council received a number of comments from consultees regarding the Interim SA. In July 2014 the Council consulted Natural England on a draft (June 2014) of the Proposed Submission Plan for comment. Comments from the Options Consultation and statutory consultees have been incorporated into this SA of the Local Plan Review. In summary, their responses stated the following:

- There were some anomalies in the number of dwellings identified in the SA and the Local Plan Review: Options Consultation Report.
- It was felt that there were some inconsistencies in how similar sites were appraised and their subsequent scoring.
- Geodiversity should also be considered.
- Colour coding would help illustrate more clearly where negative and positive effects are likely to occur.
- A non-technical summary was requested and clarity should be improved.
- New evidence where available should be considered on previously allocated sites.
- Consideration of the best and most versatile agricultural land should be provided for in the assessment.
- The commercial element of the potential J27 allocation should be assessed independently to the residential element.
- The rationale for some scores should be clarified.

3.5 The Local Plan Review sets out the preferred strategic policies for the District until the year 2033 including the future strategy for development, identifies sites for housing, employment, infrastructure, environmental protection and provides an updated set of development management policies. The preferred strategy and policies have been developed iteratively over the course of the Plan, reflecting community engagement, the SA process and the supporting evidence base.

Sustainability Appraisal framework objectives

3.6 A framework is used to understand the sustainability effects of the Local Plan Review as has been developed, consisting of sustainability objectives, each of which include a number of elements against which a policy will be appraised. The framework includes all those factors highlighted within the SA that will affect the sustainability of the Local Plan Review and is central to the process of SA.

3.7 The framework below represents a more simplified approach than that used in previous Mid Devon SAs to offer greater flexibility as the Local Plan Review contains both high level strategic policies, site allocations and detailed policies to guide development management decisions. It has also been amended to reflect comments received during the Options Consultation. This new framework can be applied to all these policies equally.

Sustainability objective	Elements covered	Impact
A) Protection of the natural environment	Habitats and biodiversity; flora and fauna; protected species; landscape, geodiversity	
B) Protection and promotion of a quality built environment	Heritage assets, including listed buildings, conservation areas, scheduled ancient monuments, registered parks and gardens, locally listed assets, archaeology; design and quality of development	
C) Mitigating the effects of climate change	Reduced flood risk; promotion of low carbon or renewable energy; reductions in carbon emissions; resilience to climate change; walking and cycling provision; low carbon buildings	
D) Safeguarding and minimising resource use	Quality of soils, including contaminated land; water quality, including consideration of water framework directive objectives; water resources; minimisation of waste; impact on best and most versatile agricultural land	
E) Promoting economic growth and employment	Increasing jobs; reducing out-commuting; skills training; growth of rural businesses; tourism provision	
F) Supporting retail	Safeguarding the vitality and viability of town centres; relationship between new development and town centres; supporting viability of shopping facilities in villages	
G) Meeting housing needs	Supply of housing; housing mix; house size; housing affordability; appropriate housing density to location; proximity to services and facilities	
H) Ensuring community health and wellbeing	Community support for proposals; access to open space and recreation; limiting air, noise and light pollution to levels that do not damage human health or natural systems; integrated and sustainable forms of travel including walking, cycling and public transport; social deprivation; safe and secure environments	
I) Delivering the necessary infrastructure	Roads and transportation; schools; health services; community facilities; green infrastructure; telecommunications	

3.8 The sustainability objectives proposed are distinct from the objectives of the Local Plan Review, though they may in some cases overlap with them. They will provide a way of checking whether the Local Plan Review objectives are the best possible ones for sustainability and will test the social, environmental and economic effects of the plan.

3.9 In order to consider the impact of the Local Plan Review against the sustainability objectives, a scoring system has been used. A score is provided against each of the objectives to highlight a policy or proposal's sustainability impacts. Collectively, this allows consideration of a policy's overall impact and enables comparison with other policies or proposals. It also enables the consideration of mitigation measures in which a secondary score has been provided if mitigation measures are provided for.

3.10 It is important to note that the scores should not be summed to produce a total score to determine the overall sustainability of a policy or proposal. Mathematical models can lead to an

'artificial certainty' in determining the effect of a policy or proposal where the impacts of issues can be subjective.

3.11 The use of a scoring system with a range from +3 to -3 highlights the scale of any potential impact. This system enables the opportunity to differentiate between marginal or significant impacts. The following table sets out the scoring system that has been used:

Score	Rationale
+3	The policy/proposal will have a significant positive contribution towards achieving the objective
+2	The policy/proposal will have a positive impact in contributing towards achieving the objective
+1	The policy/proposal will have a minor positive impact in contributing towards achieving the objective
0	The policy/proposal will have no impact or will have some positive and some negative impacts thereby having a balanced effect in contributing towards achieving the objective
-1	The policy/proposal will have a minor negative impact in contributing towards achieving the objective
-2	The policy/proposal will have a negative impact in contributing towards achieving the objective
-3	The policy/proposal will have a significant negative contribution towards achieving the objective

3.12 In some instances where there were technical deficiencies in which specific data was not available at the time of the SA assessments, an uncertain effect has been identified which is indicated by a question mark in the scoring box..

3.13 In addition to the scoring process, a commentary against each objective has been provided. This sets out a summary of the context of the policy/allocation and a description of the impact against each of the sustainability objectives. Measures for mitigation are also described and scores for post-mitigation are provided, whereby if mitigation measures are applied negative impacts may be reduced. This includes consideration of whether impacts noted are offset by other policies in the plan. Secondary, cumulative, synergistic, temporary, permanent, short, medium or long-term impacts are also reflected.

3.14 General guidance was followed when applying the scoring system to potential allocation sites; this is set out in Appendix 2. In some cases the scoring may differ from this guidance due to site specific context.

The assessment of all policies and alternative sites, and general guidance to the scoring can be found in Appendix 2.

4 Reasons for selecting / rejecting policy alternatives

4.1 This chapter summarises the reasons for selecting / rejecting the strategic, allocation and development management policy alternatives. The development of the Local Plan Review has been an on-going and iterative process with key pieces of evidence influencing the selection and rejection of options. Following each section a matrix is provided which sets out the scores of each preferred and alternative options. The full assessment of all policies and alternative sites, and general guidance to the scoring can be found in Appendix 2.

Strategic Policies

Policy S1 Sustainable Development Priorities

4.2 Policy S1 sets out the sustainable development priorities to deliver the Local Plan Review's vision.

Alternatives

4.3 No alternative strategies exist as this policy reiterates locally the National Planning Policy Framework with the exception of Policy S1 a) development focus, which is discussed in more detail under the amount and distribution of development in Policy S2.

Policy S2 Amount and Distribution of development

Amount of residential development

4.4 Policy S2 sets out the level of housing development required over the period 2013-2033. This position takes account of the latest SHMA (2015) which indicates the Districts objectively assessed need for Mid Devon as 7,200 dwellings, equating to 360 dwellings per year. The following table sets out the situation at 31st March 2014, indicating a remaining need for about 5,511 dwellings to be allocated.

Local Plan Review requirement	7,200
Completions since 2013	320
Commitments (dwellings under construction or with planning permission)	1,369
Uncommitted requirement	5,511

4.5 The SHMA 2015 will be completed before submission, the Local Plan Review will be updated to reflect the latest figures if any amendments take place.

Alternatives

4.6 The Local Plan Review: Options Consultation held in January 2014 consulted on the estimated requirement of 8,400 dwellings based on projecting forward the previous Core Strategy (2007) annual target and including a 20% buffer. This is a higher growth scenario than the SHMA 2015 has indicated in the latest report.

4.7 The SA notes that a higher growth scenario is likely to be more difficult to distribute between the towns while avoiding environmental impacts. The towns of Tiverton and Crediton are both reaching their landscape limits as they are contained in natural topographical bowls. Current development is at or just below these thresholds and significant future development may

exceed capacity under this scenario. In the case of Tiverton, only one strategic direction is available to the east and this option has landscape impacts.

4.8 In the case of Willand, growth is limited due to insufficient capacity of the existing motorway junction and the inability to fund a new junction with new strategic growth and motorway junction already committed at Cullompton. In Cullompton further growth beyond that which is proposed is limited by market capacity at least in the short/medium term.

4.9 The key purpose of this policy is to meet the housing needs of the district indicated in the latest SHMA 2015 The alternative policy option exceeds the housing needs target of 7,200 by setting a target of 8,400 dwellings and therefore is not a preferred strategy.

Amount of Residential Development		
Sustainability objective	**Preferred Meet housing need Scenario (7,200 dwg)**	**Alternative Higher Growth Scenario (8,400 dwg)**
A) Protection of the natural environment	0	-1
B) Protection and promotion of a quality built and historic environment	0	0
C) Mitigating the effects of climate change	0	0
D) Safeguarding and minimising resource use	-2	-3
E) Promoting economic growth and employment	+1	+1
F) Supporting retail	+1	+1
G) Meeting housing needs	+3	+3
H) Ensuring community health and wellbeing	+1	+1
I) Delivering the necessary infrastructure	0	-2

Amount of commercial development

4.10 Policy S2 sets out the levels of commercial development required over the period 2013-2033 at 154,000 square meters. This target takes account of the Employment Land Review 2013 (ELR) and the Retail Study 2012 that both provide technical advice on the levels of need and demand for development in Mid Devon.

4.11 The ELR recommends the Council plan for 30-40 hectares of employment land, which is considered equivalent to approximately 140,000 square metres floorspace. The Retail Study identifies a limited need for non-food retail at around 14,000 square metres up to 2026. To provide flexibility of provision and allow for growth, the Local Plan Review has rationalised the scope of employment land allocations in the District and allocates 134,420 square metres commercial floorspace on top of existing commitments of over 100,000 square metres. This approach is set out in Policies S2 & S6 and follows the recommendations of the ELR. The Scoping Report consultation identified significant support for the option to reduce employment growth.

Alternatives

4.12 The Core Strategy attempted to address the long-standing situation where a high proportion of Mid Devon residents commute to work outside the district. Employment floorspace targets and land allocations sought to address the balance by a creating a 1:1 ratio of jobs to working

population. The existing Policy COR4 sets out a need for approximately 300,000 square metres of employment (B1-B8) floorspace and 10,000 square metres of retail (A1) sales. The ELR concluded that the market is unlikely to support the delivery of the current employment land allocations. National policy also states that planning policies should avoid the long-term protection of sites allocated for employment use where there is no reasonable prospect of a site being used for that purpose. In view of the shift of policy emphasis in national policy and the revised evidence the over-allocation of employment floorspace is not a preferred option.

Amount of Commercial Development		
Sustainability objective	**Preferred Meet commercial need Scenario (154,000sq m)**	**Alternative Higher Growth Scenario (310,000sq m)**
A) Protection of the natural environment	0	-1
B) Protection and promotion of a quality built and historic environment	0	0
C) Mitigating the effects of climate change	0	-1
D) Safeguarding and minimising resource use	-1	-3
E) Promoting economic growth and employment	+3	+3
F) Supporting retail	+3	+2
G) Meeting housing needs	0	0
H) Ensuring community health and wellbeing	+2	0
I) Delivering the necessary infrastructure	0	-2

Distribution of development

4.13 The Local Plan Review seeks to concentrate development at Tiverton, Cullompton and Crediton, to a scale and mix appropriate to their individual infrastructures, economies, characters and constraints. Other settlements will have more limited development which meets local needs and promotes vibrant rural communities. Development targets are as follows:

Location	Residential (dwellings)	Commercial (square metres)
Tiverton	2,160 (30%)	38,000
Cullompton	3,600 (50%)	77,000
Crediton	720 (10%)	15,400
Rural areas	720 (10%)	30,800
Total	7,200 (100%)	154,000

4.14 Central to Policy S2 is the role of Cullompton in meeting the district's long-term development needs. The largest allocation in the Local Plan Review is East Cullompton (Policies CU7-CU12), which will have access onto the M5 motorway and deliver significant improvements to highways infrastructure for the whole town. The concurrent development of the North West Cullompton Urban Extension will see a new road linking Tiverton Road to Willand Road, which will relieve traffic congestion in the town centre, improving local air quality and the living conditions of residents. This is a departure from the historic planning strategy which focused the majority of development in Tiverton, commensurate with the size and sub-regional role of the town.

4.15 The land east of Cullompton preferred by the Local Plan Review is relatively unconstrained in landscape and environmental terms and forms a natural extension to one of Mid Devon's most sustainable settlements. Cullompton has excellent connections to the M5 motorway and the economic benefits this brings in particular with storage and distribution uses. Technical constraints to development in this location centre on the traffic capacity of the existing M5 J28. Devon County Council transport assessment confirms that existing junction capacity can't be improved and that a new slip road is required to relieve pressure. The transport assessment considered a number of alternatives solutions and concludes that a new junction is technically achievable. This takes into account the physical engineering and associated cost of constructing the transport interventions, and the potential human and environmental impacts of doing so. The expansion of Cullompton is both achievable and supported by the local community.

4.16 Tiverton will continue to expand through the development of the Tiverton Eastern Urban Extension (Tiverton EUE) and a number of smaller sites. The adopted Tiverton EUE Masterplan proposes up to 1,520 dwellings and at least 30,000 square metres commercial floorspace, with a new junction onto the A361, 47 hectares of strategic green infrastructure, a new primary school and a neighbourhood centre.

4.17 Crediton is the smallest of Mid Devon's market towns but serves a wider area in terms of employment, education and shopping. The physical constraints of Crediton limit the options for developable sites, and there are existing problems of traffic congestion through the town centre. Crediton is a designated air quality management area however the completed Crediton Link Road, which opened in October 2014, now provides a new direct route to the Lords Meadow Industrial Estate from the Wellparks roundabout on the A377, and also includes a shared cycleway and footway. The link road is seen as the primary mechanism for improving air quality in the town by redirecting traffic (in particular HGVs) from Exeter Road and thereby reducing traffic emissions. The housing target for Crediton only amounts to 10% of the district total due to the traffic and topographical constraints that exist.

4.18 Bampton has been re-classified as a village from a town to reflect the character, scale and constraints of the settlement (a review of the option to re-classify Bampton is discussed in the Villages section). Rural areas are expected to accommodate around 10% of the housing requirement for Mid Devon. The Local Plan Review generally allocates small sites, the development of which will help to support the vitality of rural areas without harming their character or putting undue pressure on local infrastructure. Commercial development in rural areas will come forward on non-allocated sites according to demand, enabled by supportive general policies. The Local Plan Review does however; retain small employment allocations in Bampton and Willand as these sites are already permitted or well-connected to existing commercial uses and infrastructure. The commercial site in Sampford Peverell is a mixed use site allocated for the development of a doctor's surgery and housing.

Alternatives

4.19 The Scoping Report in July 2013 considered three broad options, firstly retain the current strategy directing development towards the largest settlements, secondly to disperse development more widely, increasing the number of villages and allowing the larger villages to expand and thirdly a new settlement or significant expansion of an existing village to meet the districts entire need. Although the results of the public consultation favoured the first two

strategic approaches, the options consultation was strongly influenced by the availability of deliverable sites emerging from the Strategic Housing Land Availability Assessment (SHLAA).

4.20 The Options Consultation in January 2014 presented two strategic options, either to retain the town focus and concentrate development at Tiverton, Cullompton and Crediton or alternatively retain the same strategy up to 2026 but introduce a new community later in the plan period. For the second option two strategic locations for growth were considered, a commercial lead scheme at J27 adjacent Willand or the eastern expansion of Cullompton. No other alternative sites were available at the scale required to meet forecast demand in a single location.

4.21 The outcome of the public consultation showed a clear preference for option 2, a new community, 52% support in comparison to 33% support for option 1, the town centric approach. A town focused strategy of development would see continued development concentrated at Tiverton, Crediton and Cullompton following Mid Devon's historic pattern of growth. Of the new community options, development at east of Cullompton was favoured receiving 59% support in comparison to 24% support for J27 adjacent Willand. The SA of site specific options of East Cullompton and Land at M5 J27 Willand provides further analysis and comparison.

4.22 As well as considering public views, the preferred strategy must consider sustainability impacts and technical delivery. The SA of Policy S2 acknowledges advantages with a single new community including a scale of development that could support long term housing and commercial development for Mid Devon up to 2033 with the appropriate level of infrastructure and community facilities. With the effect on the natural environment and transport infrastructure an uncertain effect depending on the location of the site. A dispersed strategy was considered to be able to be more easily absorbed into the landscape and with potentially less impact on existing services, however there were limitations with this option due to the land availability in Crediton and Tiverton.

4.23 A straight forward comparison of individual sites through the town-centric strategic option is not considered practical through the SA given the number and combination of sites within each town. It is however considered implicit that should this approach be selected, strategic growth above and beyond the Tiverton EUE would be expected. Given Tiverton's topographical constraints only two directions of growth remain viable for development, firstly north of the A361 and secondly to the east along the valley. The Council has explored land availability to the north and has received confirmation that this is not available. To the east the only option is Hartnoll Farm, which is available and of significant scale to bring forward major housing and employment growth.

4.24 The SA of this site identifies a number of significant constraints. Development in this location would have a negative effect on the landscape character of Mid Devon; the site is bordered by the Grand Western Canal a County Wildlife site and Local Nature Reserve as well as a Conservation Area. There are significant coalescence concerns with the village of Halberton which has its own distinct identity. Beyond the site, transport study work by Devon County Council demonstrates concerns for traffic entering key junctions into central Tiverton and onto the A361 or out through the narrow roads of Halberton. Initial modelling suggests an additional relief road would be required through the Blundell's School site which itself has delivery issues.

4.25 At J27 land adjacent Willand, the SA assessed the residential and commercial elements separately as requested through the consultation process. For both elements the SA raised concerns around the potential for development to lead to a significant negative impact on the Culm Grasslands SAC due to increased traffic along the A361. This in combination with the scale of each element leading to potential negative impacts on the landscape and biodiversity led to a negative score of development at J27 on the environment. The SA also identified that residential development in this location would be situated in the open countryside, an unsustainable location some distance from existing facilities. Concerns were raised by duty to cooperate bodies on the commercial element of the site, in particular retail and the potential for this to negatively impact on town centre vitality and viability. The Tourism Study (2014) suggests that a major tourist facility would need to be supported by bespoke market research and any impacts on other parts of the district, particularly the market towns, and potentially on other adjoining areas be carefully considered. A commercially led tourism proposal in the same location was also assessed but was lacking sufficient information at the time of writing to fulfil the Council's requirements and the Duty to Cooperate. Furthermore the location of the commercial development could constrain future working of the remaining permitted mineral reserves within Hillhead Quarry. Again, Devon County Council has considered traffic and transport infrastructure at J27 which would also experience capacity issues without appropriate mitigation. In considering the range of potential significant issues with either the commercial or residential elements of development at J27, development at this site would not be preferred. The separate assessments of the commercial and residential elements of J27 are reflected in the villages section of the matrices and Appendix 2.

Distribution of Development (using preferred option of 7,200 dwellings)			
Sustainability objective	**Preferred New Community (J28 Cullompton)**	**Alternative Town Focus (Hartnoll Farm)**	**Alternative New Community (J27 Willand)**
A) Protection of the natural environment	-1	-1	-2/?
B) Protection and promotion of a quality built and historic environment	0/?	-2/?	0/?
C) Mitigating the effects of climate change	0/?	0/?	0/?
D) Safeguarding and minimising resource use	-3	-3	-3/?
E) Promoting economic growth and employment	+3	+2	+3
F) Supporting retail	+1/?	+2	-3/?
G) Meeting housing needs	+3	+3	+3
H) Ensuring community health and wellbeing	0	+1	0
I) Delivering the necessary infrastructure	+2	+2	+2/?

Policy S3: Meeting housing needs and Policy S4: Ensuring housing delivery

4.26 There is a continued need for affordable housing in Mid Devon which has been demonstrated by various reports. The SHMA concluded that 96 units of affordable housing are needed per year to meet existing "backlog" need and future needs arising in the district. This is equivalent to about 27% of the total housing need for Mid Devon. This is reflected in the affordable housing policy which requires development to meet this need by providing a proportion of

dwellings as affordable on sites above the threshold. The application of the affordable housing policy is anticipated to deliver just over 2,000 affordable dwellings across the plan period, equating to approximately 28% of total housing supply. However it is recognised that the level of supply is unlikely to meet the anticipated need as not all allocations will come forward or others may be developed with a lower housing number than specified in the policy. Furthermore, the Council has to consider the implications of meeting the need on the viability of new housing development.

4.27 Viability assessment work undertaken for the Council in relation the Community Infrastructure Levy (CIL) has established that with a target of 30% affordable housing in rural areas and a 25% target in the towns a CIL charge of £60 per sq m is viable. Balancing the provision of affordable housing with infrastructure is essential to achieve sustainable development over the plan period to 2033.

4.28 Policy S3(b) gives open market housing sites of 11 dwellings or more in Tiverton, Cullompton and Crediton a target of 28% affordable dwellings, and on sites elsewhere of 6 dwellings or more a target of 30% affordable dwellings. The Local Plan Review supporting viability study tested multiple alternative scenarios and concluded that this option was viable without undermining infrastructure provision through CIL. The Options Plan consulted on the Adopted policy position set out in the AIDPD AL/DE/3 with the exception of Bampton which has been reclassified as a village.

4.29 Local evidence suggest that there is a demand for self-build housing in Mid Devon in that approximately 2,000 people search online for self-build plots every year in Mid Devon and the Council's Citizen Panel Survey (2013) shows that 12% of respondents were considering building their own home. To support self-build housing on sites of 20 dwellings or more, Policy S3(d) requires developers to make available for purchase at least 5% of serviced dwelling plots for sale to self-builders for a period of 12 months per plot and any plots subsequently developed for self-build must be completed within 3 years of purchase by a self-builder. As a new Government lead delivery mechanism, there is a degree of uncertainty in determining the level of interest in this proposal, a flexible approach has therefore been applied.

4.30 Policy S3(e) states that a five year supply of gypsy and traveller pitches will be allocated on deliverable sites within Mid Devon, this approach reflects the NPPF position locally.

4.31 If housing delivery falls below the action level set out in Policy S4 or a five year supply cannot be demonstrated, this will be addressed through proactive development management to bring forward allocated and permitted sites, and then through the release of deliverable contingency sites. This policy supports the NPPF which requires local planning authorities to ensure that there is a supply of specific deliverable housing sites with a capacity equivalent to 105% or five years' worth of the annual housing target by releasing contingency sites. Alternative contingency sites were considered through the SA of individual sites.

Alternatives

4.32 To ensure development which is both viable and sustainable, no reasonable alternative strategies have been identified.

Policy S5: Public open space

4.33 Access to public open space including sports facilities is an essential element of healthy communities and national policy promotes such provision. To this end the Council has undertaken an Open Space and Play Area Study (2014) to identify the level of supply across Mid Devon and the gaps in open space provision. The results of the study are presented in Policy S5 which aims to maintain the current levels of provision per person as Mid Devon's population increases and to increase the provision of teenage facilities.

Alternatives

4.34 The preferred option builds on the policy presented in the Options Consultation which used 'Fields in Trust' six acre standard in proxy for the draft Open Space and Play Area Strategy. No reasonable alternative strategy has been identified.

Policy S6: Employment

4.35 The provision for employment needs of community in this policy reflects the amount of commercial floorspace identified in Policy S2: Amount and Distribution of Development and sets out the range of employment-generating uses considered.

Alternatives

4.36 Given the reasons set out in the assessment of Policy S2: Amount and Distribution of Development for reduced employment growth and the arguments against the over-supply of employment floorspace no reasonable alternative strategies are considered.

Policy S7: Town Centres

4.37 Policy S7 seeks to secure the sustainability of Mid Devon's market towns by focusing development within town centres. The Retail Study suggests that a changing role or focus for town centres may be required, involving conversion and redevelopment to other uses. To this end, the Local Plan Review incorporates tourism and leisure uses within the retail part of the commercial development target in Policy S2 and has a positive strategy for the enhancement and regeneration of town centres.

Alternatives

4.38 No reasonable alternatives are considered as this policy promotes sustainable development in town centres. The Policy was updated from COR6 to exclude Bampton reflecting its change in its status to a village. The re-classification of Bampton as a village is discussed under Policy S13: Villages.

Policy S8: Infrastructure

4.39 Policy S8 ensures that new development is served by appropriate infrastructure.

Alternatives

4.40 No reasonable alternative strategy has been identified.

Policy S9: Environment

4.41 Policy S9 supports development that will sustain the distinctive quality, character and diversity of Mid Devon's environmental assets and minimise the impact of development on climate change.

Alternatives

4.42 No alternative strategies exist as these policies reiterate locally the National Planning Policy Framework.

Policy S10: Tiverton

4.43 Tiverton will continue to develop in a balanced way as a medium sized market town serving a rural hinterland in the eastern part of Mid Devon. The overall development targets for Tiverton are set out in Policy S2. The policy lists local objectives. The figures set out in this policy reflect a number of smaller sites allocated around the town. This strategy was supported in the Scoping Report Consultation (July 2013).

Alternatives

4.44 To accommodate additional housing need, this would require further expansion to the east 'Hartnoll Farm'. Given the reasons set out in set out in the assessment of Policy S2: Amount and Distribution of Development for the preference of the East Cullompton site and the issues around the Hartnoll Farm site no alternative strategies are considered.

Policy S11: Cullompton

4.45 Cullompton will develop as a fast growing market town with a strategic role in the hierarchy of settlements in Mid Devon. The town will become the strategic focus of new development reflecting its accessibility, economic potential and environmental capacity. The overall development targets for Cullompton are set out in Policy S2. The policy list local objectives, these have no alternatives. The option to pursue an alternative growth option in Cullompton was supported in consultation.

Alternatives

4.46 Given the reasons set out in set out in the assessment of Policy S2: Amount and Distribution of Development for the preference of the East Cullompton site no alternative strategies are considered.

Policy S12: Crediton

4.47 Crediton will continue to develop in its role as a small and vibrant market town, serving a rural hinterland in the western part of the district. The overall development targets for Crediton are set out in Policy S2. The target is a lesser amount than that which would meet the towns housing and commercial needs. This reduced figure reflects the numerous constraints facing the town, which include the need to avoid negatively impacting on the historic centre and adjoin historic parks and gardens whilst also acknowledging the challenging local topography and the potential for landscape impacts from development further into the hillside. The policy list local objectives, these have no alternatives.

Alternatives

4.48 The district-wide strategic option of providing a new community at J27 or J28 of the M5 would result in the same housing target for Crediton as Option 1. Meeting the housing and commercial needs of Crediton was not considered reasonable given the constraints facing the town and the available sites in Crediton.

Policy S13: Villages

4.49 There are a number of settlements which do not function as market towns, but which provide a limited level of services which support vibrant rural communities. These are locations which are suitable for a limited level of development meeting local needs appropriate to their individual opportunities. The 22 settlements set out in the policy are considered to be appropriate for a limited level of development, based on their physical characteristics, and the availability of the following three essential services identified: educational facility, convenience store and transport service. The recent national trend in the loss of rural services has meant that if more essential services were required, for the category, very few villages would now qualify as a village and the essential services were agreed as appropriate from a transport perspective by Devon County Council. Yeoford does not have a shop but is considered appropriate for inclusion in Policy S13 due to its accessibility to other settlements and the availability of public transport including a daily train service. The *Living Working Countryside: The Taylor Review of Rural Economy and Affordable Housing* (2008) supports development in rural areas which makes living in the countryside more sustainable. As there are a number of developments which come forward in rural areas within settlement limits, having small allocations in villages for development will ensure the vitality of rural areas without harming their character or putting undue pressure on infrastructure.

Alternatives

4.50 The option to have limited to zero development in the villages and spread development between the market towns was not considered a reasonable alternative. The previous strategy for development pursued a very strong town-centric strategy, but since 2006 the average housing completions outside the towns have been twice the level anticipated, leading to the need for allocation sites within villages to be included in the Local Plan Review.

4.51 The Options Consultation considered two alternative options; either have a higher 1,600 residential dwellings in rural areas or a lower 1,040 residential dwelling numbers. The first option was in association with the town centred option and the second with the new community approach. As these options are considered under the ***Distribution of development*** section, no alternative strategies for villages are considered as these are incorporated in the alternatives for S2: Amount and distribution of development.

Bampton

4.52 In response to the Scoping Report consultation and taking into account the written responses received, Bampton has been re-classified to match the designated villages in Mid Devon. This approach ensures that development will still be provided in Bampton but at a level appropriate to its individual opportunities.

Alternatives

4.53 Previously Bampton was classified as a town, however upon analysis, Bampton met the essential criteria identified in Policy S13 and has similar characteristics to other settlements identified as villages in this plan, including a similar parish population size. In comparison to the three market towns within the district, the population of Bampton parish is more than four

times smaller than Crediton, the smallest of the market towns identified in this plan. Although Bampton provides important services to the surrounding community it does not have the same significant strategic role of the three market towns within the district (Tiverton, Cullompton and Crediton), which provide a range of services, retail and employment to the surrounding community and are well connected to the Strategic Road Network. Bampton is not located near the Strategic Road Network and the nature of the road within Bampton itself limits the level of traffic that can be supported through the settlement. Bampton also has some topographical and flood risk constraints which restrict the level of development which can be accommodated within this settlement. Therefore the classification of Bampton as a town is not a preferred option.

Policy S14: Countryside

4.54 A strong rural economy is promoted by national policy through sustainable growth of business and enterprise in rural areas. Development in the countryside will be managed to meet local need, promote vibrant rural communities and help provide appropriate forms of agricultural and rural diversification to support the rural economy and sustain environmental qualities of the countryside. National policy advocates the provision of market housing in rural areas where it would facilitate the provision of significant affordable housing required to meet housing need. To facilitate the provision of affordable and low cost (discounted) housing in rural areas across Mid Devon, rural exception sites will be considered. New isolated homes will be avoided in the countryside unless there are special circumstances as set out in national policy and supplemented in relevant Local Plan Review policies such as Policy DM6: Rural exception sites, DM8: Rural workers' dwellings and DM9: Conversion of rural buildings.

Alternatives

4.55 No alternative strategies exist as these policies reiterate locally the National Planning Policy Framework.

Site Allocations

4.56 The selection of site allocations at Tiverton, Cullompton, Crediton and the villages has been an iterative process principally steered by the scale and distribution of development set out in Policy S2: Amount and distribution of development, the availability of deliverable sites, public consultation and the SA process.

4.57 All of the sites consulted on in the Options Consultation were considered deliverable by the SHLAA panel and the Strategic Commercial Land Availability Assessment (SCLAA) panel and were assessed by the SA. Further sites put forward at the Options Consultation stage were taken to the relevant SHLAA or SCLAA panel. All new sites thought to be deliverable by the SHLAA or SCLAA panel have also been subject to detailed SA. Appendix 3 provides a list of sites considered undeliverable by the panels.

Tiverton

4.58 Eight sites are allocated for housing in Tiverton, excluding two contingency sites at Tidcombe Hall and Wynnard's Mead that will be permitted to come forward if the Council's housing supply proves insufficient, as set out in Policy S4: Ensuring Housing Delivery. The eight sites are; Tiverton EUE , Farleigh Meadows, Town Hall/ St Andrews Street, Land at Moorhayes Park, Howden Court, Roundhill, Palmerston Park and Phoenix Lane.

4.59 The Tiverton EUE is the town's only strategic site which has an adopted Masterplan that proposes up to 1,520 dwellings and 30,000 square metres commercial floorspace, with a new junction onto the A361, a new primary school and community facilities. Polices TIV2-5 provide mitigation measures to address sustainability concerns.

4.60 Two sites in Tiverton are allocated to deliver employment up to 2033, through a range of uses: Tiverton EUE and Phoenix Lane.

4.61 Tidcombe Hall and Wynnards Mead have sustainability concerns hence their contingency status. Tidcombe Hall is reasonably well contained in the landscape but has a potential localised impact on landscape character, the setting of Tidcombe Hall and the Grand Western Canal. The site would also result in the loss of grade 1 agricultural land and would require improvements to Tidcombe Lane. The development of Wynnards Mead would impact on the house and the adjacent listed building as well as have potential visual impacts due to topography. Although an adequate site access is considered achievable, the existing carriageway and footway links to Tiverton are very steep and would require upgrading.

4.62 All sites have undergone a detailed SA against realistic alternatives and have had mitigation measures identified and included in their respective policy.

4.63 The Council's strategic infrastructure policy is set out earlier in the Local Plan Review under Policy S8, but there are infrastructure requirements specific to Tiverton that are listed under Policy TIV15.

Alternatives

4.64 The Scoping Report consultation proposed two distinct options for Tiverton, firstly to continue with the current strategy expanding Tiverton to the east and allocating smaller sites around the town or identify a new location for long-term strategic growth (other than the east). The

second option was favoured in this initial public consultation. No long-term strategic sites around Tiverton were identified, apart from to the east, due to topographical issues to the south, west and north of the town, and flooding issues along the River Lowman and River Exe to the north, north east, north west and south west of the town. All SHLAA or SCLAA sites identified as deliverable (suitable, available and achievable) were included within the Options consultation. The Options Consultation identified seventeen potential housing sites within Tiverton some of which were already allocated in the existing Local Plan. A number were mixed use. Four sites were identified for deletion as they were either completed or under construction. Land at the Foundry was added later in the process as a result of the Options Consultation.

4.65 Hay Park has not been taken forward as development would result in the loss of historic barns (to ensure adequate access visibility displays) and has surface water flooding issues associated with the water course on site.

4.66 Although the Blundell's School site scores well in SA terms as a brownfield site in the heart of the town and could bring with it positive measures in delivering a link road, the Council's SHLAA panel believe delivery costs principally associated with access and flood mitigation measures would prohibit development in this location.

4.67 Leat Street has not been taken forward as it is an existing show room and as a residential allocation would result in the loss of employment land. A large portion of the site is located in flood zone 2 and even with mitigation measures there would remain flooding concerns.

4.68 The Avenue is a previously allocated brownfield site in central Tiverton. Although the site scores positively on sustainability grounds the site is not being comprehensively promoted by all land owners and has not received confirmation of delivery. The site is located within the settlement boundary and can come forward as a windfall allocation.

4.69 Exeter Hill is a steeply sloping site with large views of Tiverton and would be highly visible from the town. Although the level of development is relatively low, development of the site is still likely to result in a negative impact on the character of the landscape.

4.70 Land at Bampton Street / William Street Car Park has an estimated site capacity of 60 dwellings and 9,300 sqm of mixed commercial floor space. Although in sustainability terms site regeneration is a positive the SCLAA panel has raised delivery concerns.

4.71 Land at the Foundry has been proposed for commercial uses but is located in the flood plain. As it is within close proximity to the River Lowman and that the whole of the site has flooded in the past, there is a high possibility that the site is within the functional floodplain (Flood Zone 3b). There are also concerns over contaminated land which would need to be investigated and resolved.

4.72 Hartnoll Farm is considered a Strategic site option and has not been favoured as a preferred strategy through Policy S2. The inclusion of Hartnoll Farm in the Local Plan Review would extend Tiverton to the East substantially along the valley floor; significantly close the gap between urban areas and nearby villages, especially Halberton, and increase the distance from the town centre and services, resulting in increased car use and reduced sustainability. The majority of the site is classed as agricultural land grade I and development could impact on the

Grand Western Canal Conservation Area to the South and the East of the site which is also classed as a County Wildlife Site and Local Nature Reserve.

4.73 Below is a summary table of the housing and commercial sites assessed against the Sustainability Objectives. For information on the scoring, please see Appendix 2.

Cullompton

4.74 Six sites are allocated for housing in Cullompton, excluding one contingency site at Colebrook that will be permitted to come forward if the Council's housing supply proves insufficient, as set out in Policy S4. The six sites are; North West Cullompton, East Cullompton, Knowle Lane, Ware Park & Footlands, Land at Exeter Road and Cummings Nursery. Four sites are allocated for commercial use of which two are large scale mixed use sites at North West Cullompton and East Cullompton while the other two are Week Farm and Venn Farm.

4.75 North West Cullompton is retained as an existing strategic allocation. Initial work on the Masterplan has demonstrated only a reduced site capacity can be realised than that previously allocated in the Allocations and Infrastructure Development Plan Document (AIDPD) 2010, this is due to topographical constraints. With this reduction in mind the two adjacent options sites at Growen Farm to the west and Rull Lane to the north (a new site emerging from the Options Consultation) have been incorporated into the larger allocation site. These two additions ensure total site capacity remains approximately the same as previously allocated. The North West Cullompton sites now makes provision for 1,150 dwellings and 21,000sqm of commercial land, the site will include a road linking Tiverton Road and Willand Road.

4.76 A site of 160 hectares to the East of Cullompton is considered a long term location for strategic growth for the district. The site has an estimated capacity of 2,100 dwellings and 20,000 sqm commercial within the plan period and further residential development and 12,000 commercial floorspace post 2033. Development in Cullompton is severely constrained by the limited capacity at J28 of the M5 motorway, in addition to traffic congestion and poor air quality in the town centre. However this development, in combination with the urban extension to the North West of Cullompton, presents an opportunity to resolve town centre traffic problems through a Town Centre Relief Road, a 'through road' in the North West Cullompton site linking Tiverton Road and Willand Road and providing an alternative means of access onto the M5.

4.77 The site Cummings Nursery (previously known as East Culm Farm) has Planning Permission and is retained. The allocation at Knowle Lane is now nearing completion and a further site, Ware Park and Footlands, has been allocated which acts as small extensions in this location. Land at Exeter Road is retained as an existing allocation. Land at Colebrook is not required or preferred to other locations but a smaller site area than that proposed has been retained as a contingency. The reduced site area mitigates flood risk associated with the stream.

4.78 Week Farm commercial allocation is retained and supplemented by Venn Farm a sustainable location for a further 10,000 sqm of commercial floorspace. The mixed use strategic allocation at North West Cullompton and East Cullompton provides a combined amount of 41,000sqm of commercial floorspace within the plan period.

4.79 All sites have undergone a detailed SA against realistic alternatives and have had mitigation measures identified and included in their respective policy. Please see Appendix 2 for detailed analysis of the preferred and alternative sites assessed against the Sustainability Objectives.

4.80 The Council's strategic infrastructure policy is set out earlier in the Local Plan Review under Policy S8, but there are infrastructure requirements specific to Cullompton that are listed under Policy CU19 & CU20.

Alternatives

4.81 Within the Scoping Report consultation, two options were proposed for consideration; to retain the current strategy with North West Cullompton Urban Extension as the primary site allocation and the Town Centre Relief Road, to pass through either the Cullompton Community Association fields to the west of the M5 or to pass to the east of the M5, or to find an alternative growth option such as a different location for an urban extension or multiple smaller sites around Cullompton, as highways infrastructure can be delivered. The second option was strongly supported by those responding to the consultation.

4.82 All SHLAA and SCLAA sites identified as deliverable (suitable, available and achievable) were included within the options consultation. The Options Consultation identified eleven potential housing sites within Cullompton some of which were already allocated in the existing Local Plan. A number were mixed use. Three sites were identified for deletion as they were not found suitable due to environmental constraints or are largely built-out. Eight sites were identified by the SCLAA as suitable for commercial development including a number of mixed use sites also considered for residential. Sites excluded through the SA process are discussed below.

4.83 Court Farm a previously allocated site is now largely built out with delivery concerns for the remaining site area. The site is located within the settlement limit and is suitable to come forward as a windfall site.

4.84 Acklands has recently been used as sport's pitches. National policy stipulates limited circumstances in which land for sport can be developed for alternative uses. The site is also classed as grade I agricultural land, the best and most versatile classification of land.

4.85 Tiverton Road is located to the west of Cullompton and would be an illogical extension in an isolated spur to the town. The site is also made of grade 1 high quality agricultural land, which covers only 3.5% of Mid Devon District.

4.86 Land at Bradninch Road steeply slopes and has a potential for visual impact as well as the loss of grade 3 agricultural land.

4.87 Part of the Commercial land at North West Kingsmill is located in flood zones 2 and 3 and it is isolated from the other parts of the industrial estate. The land adjacent Venndale and North East Kingsmills were less preferred than Venn Farm which is better related to the settlement form. The Week Farm allocation is retained. The North West Kingsmill and land adjacent to Vendale have been assessed together in Appendix 2 and the summary table below.

4.88 South of Springbourne can be viewed from the west and the east and has a high visual impact and there are also access concerns resulting in this commercial option not being preferred.

4.89 Below is a summary table of the preferred and alternative sites within Cullompton showing the scoring against the 9 sustainability objectives. For a more detailed assessment for each site, please see Appendix 2.

Crediton

4.90 Nine housing sites are allocated in Crediton, including Red Hill Cross and Wellparks which have planning permission. The other sites are; Cromwells Meadow, the Woods Group, Pedlerspool, Sports Field, Stonewall Lane, Land at Barn Park and land off Alexandra Close. Wellparks and Land south of A377 in Crediton are expected to deliver commercial floorspace during the plan period.

4.91 Wellparks will deliver 185 dwellings and 2,220 sqm of commercial land and is adjacent the new Crediton link road. Land at Pedlerspool previously a contingency site is allocated for 200 dwellings and the relocated Rugby Club which will free up the Sports Field for a further 120 dwellings. Stonewall Lane is in the northern part of Crediton and Red Hill Cross is an existing commitment, therefore it is included. Other small sites allocated will limit sustainability impacts including Cromwells Meadow, Land at Alexandra Close, the Woods Group and Land at Barn Park.

4.92 Land to the South of A377 formed part of an existing commercial allocation in an earlier Local Plan and is retained as a suitable commercial site.

4.93 All sites have undergone a detailed SA against realistic alternatives and have had mitigation measures identified and included in their respective policy. Please see Appendix 2 for the detailed analysis of sites against the 9 Sustainability Objectives.

4.94 The Council's strategic infrastructure policy is set out earlier in the Local Plan Review under Policy S8, but there are infrastructure requirements specific to Crediton that are listed under Policy CRE11.

Alternatives

4.95 The Council has previously acknowledged that Crediton has significant topographical constraints and is therefore an unsuitable location for large scale allocations. The Scoping Report presented two options; to continue with the strategy for under-provision due to these physical constraints or to allocate sufficient sites to meet development needs. The consultation responses favoured the second option. All SHLAA or SCLAA sites identified as deliverable (suitable, available and achievable) were included within the options consultation. The Options Plan identified thirteen potential housing sites within Crediton some of which were already allocated in the existing Local Plan. Since the Options consultation, one site, George Hill, has been built out and has therefore been removed from the SA. Four sites were not preferred by the Council due mainly to environmental issues. Four commercial sites, including one mixed-use site came forward as commercial options for Crediton. Sites excluded through the SA process are discussed below.

4.96 Westwood Farm is located on the west side of the town, and any traffic generated by the site travelling to Tiverton, Exeter or the M5 would pass through the High Street rather than along the new Link Road, thereby potentially further exacerbating existing air quality issues.

4.97 Chapel Down Farm is not favoured as the northern portion of the site is grade 2 agricultural land and Chapel Downs Farmhouse is a listed building which sits adjacent to the site. Development of the surrounding agricultural land will further impact on the setting of the building, with the potential to reduce its significance.

4.98 Barnfield scores well in sustainability terms but subject to a suitable access being achieved. As a small brownfield site within the settlement limit, the site remains deliverable as a windfall site.

4.99 Fairpark House site is located within the conservation area and is in close proximity to a listed building. The site is a greenfield, with an agricultural land grade of 3 on a quarter of the site, the remaining part of the site has an unknown agricultural land grade.

4.100 Higher Road is located to the north of Higher Road on a greenfield site where there is currently little development. The site is relatively far from the town centre, but considered within walking distance. The site is bounded to the north by ancient woodland and scores well in sustainability terms but subject to suitable access being achieved.

4.101 South of Common Marsh Lane is not allocated as it is a greenfield site which falls within agricultural land grade 2. The site is also located adjacent to the existing industrial estate, increasing the industrial estate to the north where it would have landscape impacts.

4.102 Land East of Exeter Road is not favoured as the southern element of the site, comprising 3.4 hectares is agricultural grade 3. The elevated nature of the site means there is potential for development to have adverse landscape impacts as well as a negative impact on the historic setting of the adjacent buildings along Exeter Road. The site is also located adjacent to the existing industrial estate and in close proximity to the new link road.

4.103 Land at George Hill was under construction and has now been completed and has therefore been deleted. An SA for this site has not been included for this site.

4.104 Below is a summary table of the preferred and alternative sites within Crediton showing the scoring of the preferred and alternative sites against the 9 sustainability objectives. For a more detailed assessment for each site, please see Appendix 2.

Village Allocations

4.105 The development strategy for villages is set out in Policy S13. In total twenty-one housing sites are allocated in rural areas which are considered achievable. Most housing allocations in rural areas are expected to deliver around 20 dwellings per hectare due to the low density character of existing village development, but in some cases a higher or lower density is justified.

4.106 The Options Consultation identified sixty-nine potential housing sites in rural areas considered achievable in principle by the SHLAA panel with a total site capacity well above the anticipated rural requirement. Allocations in villages received a significant level of responses for and against individual sites during the Options Consultation. During this public consultation, thirteen additional sites have been proposed and considered through SA. This information has been used alongside the Sustainability Appraisal to determine final selection of preferred village allocation sites.

4.107 Site options promoted in un-designated villages (Policy S14: Countryside) have not been taken forward as they are located in unsustainable locations. These villages are as follows: Bickleigh, Burlescombe, Colebrooke, Oakford and Shillingford.

Bampton

4.108 In Bampton three existing allocations are retained Newton Square, Scotts Quarry and Ashleigh Park. Newton Square is an existing allocation in a sustainable village centre location and Scotts Quarry and Ashleigh Park both have planning permission, but have not started construction hence their inclusion within the plan. Newton Square scores positively for safeguarding and minimising resource use as development would be located on brownfield land. The location of the development also provides the opportunity to make provision for the parking of delivery vehicles serving the convenience store at 4-6 Newton Square which helps support retail in Bampton.

Alternatives

4.109 Bourchier Close and South Molton Road include areas of agricultural grade 3 land and therefore do not score as positively in safeguarding and minimising resource use as the preferred sites Newton Square and Scotts Quarry which include brownfield land and an opportunity to remediate contaminated land. Although Ashleigh Park has a similar agricultural land class as the alternatives, this site has planning permission and therefore its delivery is more certain and is preferred in comparison to the alternatives. South Molton Road has numerous protected trees on the site, which could be affected if the site was developed for housing. Land at Ball Hill is also adjacent to the sewage treatment works. If the site was developed the amenity of future residents may be negatively affected by odours associated with the works, which would be less likely to affect sites located at a further distance.

Bow

4.110 In Bow the existing allocation of West of Godfrey Gardens is retained and land adjacent to Hollywell allocated. The West of Godfrey Gardens site now has planning permission, but was not under construction at the end of the most recent monitoring year. Land adjacent to Hollywell is a flat site which has the potential for only limited visual impact, in that it can be

accommodated within the pattern of built development, having existing buildings on its north, south and western boundaries.

Alternatives

4.111 Land adjacent Bow Mill Lane is more elevated than the adjacent West of Godfreys Gardens, having the potential for greater visual impact than the proposed allocations. The site of East Langford Farm would result in an unusual and illogical extension to the built environment. The site would project into the surrounding fields, resulting in a site with fields on each boundary but a poor relationship with the adjacent housing. Land adjacent Jackman car park is steeply sloping, and falls away sharply to the north. Developing the site would extend the built environment on the north side of the main road, which currently is generally arranged in a linear fashion, hugging the line of the A3072. Two commercial sites in Bow, South of Iter Cross and South West of Junction Road are existing allocations which are proposed for deletion. National and local policy towards rural employment development is now more permissive, and as a result these sites do not need to remain allocated in order to come forward.

Bradninch

4.112 In Bradninch only one option was promoted and this site has been allocated. Although the site scores a slight negative on the safeguarding and minimising resource use as it is located on grade 3 agricultural land, this is a small site which would provide local housing and contribute to affordable housing numbers in the district. The site has a good relationship with the existing built environment, being adjacent to existing housing to the north and west. The site is a logical extension to the built form, with the eastern boundary of the site following the line set by the furthest extent of the rear garden of the adjacent property.

Alternatives

4.113 No alternative sites were promoted in Bradninch.

Chawleigh

4.114 In Chawleigh the Barton has been allocated. This site is generally level and has an existing access provided as part of the adjacent School Close exception site development. The site has been reduced in size in comparison to the site promoted in the Options version of the Local Plan Review, in order to separate the site from the conservation area which lies to the east. In particular a row of trees, which lie within the conservation area and which line the route to buildings complex called 'The Barton', could have been detrimentally affected had the site area remained as originally proposed.

Alternatives

4.115 The alternative site of Tower Meadow has not been allocated. This site is located within the conservation area which could be negatively affected by developing in this location. A number of applications for development of this site have been refused in the past, with inspectors considering that the site currently makes an important contribution towards the character of the conservation area. On this basis the site is not proposed to be allocated.

Cheriton Bishop

4.116 In Cheriton Bishop a large area of land was promoted but only a small site at Land off Church Lane is allocated. This site has the benefit of linking the two parts of the village together, providing additional footpath across the site frontage. This improvement for example would reduce the need to walk in the road when heading towards the school from the southern part of the village.

Alternatives

4.117 A large amount of land was put forward for consideration within the village. The scale of the village naturally dictates that allocating much of this land would have been appropriate. However, in regards to each site, there are specific reasons why the other four options were not pursued. The Land near the church, is directly adjacent to the conservation area and wraps around the Grade II* The Old Rectory, which could be negatively affected by developing in this location. Glebe is used as a playing area which is used by the local community and would need to be replaced if the site was to be developed. This can be avoided through the selection of other sites. Land adjacent to Woodleigh Hall and Land East of Hill View would extend the village in a linear fashion along the line of the former A30. Though this option is possible, alternative sites within the village are in closer proximity to local facilities (such as the school), thereby reducing walking times and potentially reliance on the private car.

Cheriton Fitzpaine

4.118 Four sites were put forward within the village. Two sites, Barnshill Close and Land adjacent primary school, have been proposed for allocation. Barnshill Close is a small infill site, with an existing access and is surrounded on three sites by modern built development. The impact of developing this site is considered to be very low. However, this is only a very small site, and as a result another site is proposed for allocation. Allocating Land adjacent to the new primary school provides the opportunity to ensure short walking distances to the school, as well as establishing a link between the main part of the village, and the nearby housing at White Cross. The allocation of these two sites also received generally wide support at the Options Consultation.

Alternatives

4.119 In Cheriton Fitzpaine a significant level of opposition was raised against the Glebe site in favour of other sites in the village. Responses from the Options Consultation highlighted the Glebe as being an area of green space of particular importance to the local community. It is also steeply sloping and has a portion of the site within Flood Zone 3. Landboat Farm, is also partially sloping and has an area within Flood Zone 3. Though the affected parts of the site could be excluded from housing development, the allocation of other sites in the village which are not in proximity to the floodplain reduces the likelihood of any negative impact on flood risk. Poole Barton is not preferred as it has the potential for a range of negative impacts. These include its partial location within the floodplain and conservation area (as well being adjacent to the Grade II* Poole Barton farmhouse).

Copplestone

4.120 In Copplestone the Old abattoir site presents the opportunity to provide a car park to serve the railway station. The site also may contain contaminated land, which can be remediated as part of the redevelopment of the site.

Alternatives

4.121 The alternative sites in the village received a significantly higher proportion of objection during the Options Consultation. Dulings Meadow and Bewsley Farm are relatively high grades of agricultural land, being grades 2 and 3 respectively. The Old Abattoir is nominally grade 3 agricultural land, but in reality is partially brownfield, having a number of buildings, now demolished, which were once contained within the eastern portion. Land off Bassetts Close is an existing allocation proposed for deletion. Land is not available to provide the required width of access off Bassetts Close, and therefore the site is not considered deliverable.

Culmstock

4.122 In Culmstock the two existing housing allocations Linhay Close and Hunter's Hill are proposed to be retained. Linhay Close has been extended from the area currently allocated, but is a small site with the potential for limited visual impact. Hunter's Hill is also retained, being another small site adjacent to modern housing.

Alternatives

4.123 The two sites of The Croft and Culmstock Glebe and Rackfields are not preferred. Both are within the elevated southern part of the village, with greater potential for landscape and visual impacts. This part of the village also contains the core of the conservation area, which is focused around All Saints Church. There is greater potential for impact on the conservation area should these sites be developed, which can be avoided by selecting others within the village. In addition, the Culmstock Glebe and Rackfields site received the greatest level of objection, of all the village's sites, during the Options Consultation.

Halberton

4.124 In Halberton it is proposed to allocate the Land adjacent Fishers Way. This site was suggested as the preferred site of Halberton Parish Council, during the Options Consultation. It is adjacent to modern development and will have limited visual impact.

Alternatives

4.125 Land at Blundells Road was not favoured by the Parish Council. The site is within the conservation area, with the potential for negative impacts, which can be avoided by allocating the other site within the village. Both sites would involve the loss of grade 1 agricultural land, the best quality agricultural land. However, the village is surrounded by only grades 1 and 2 land, and any allocation would involve some loss. No alternative sites of predominantly grade 2 land were put forward.

Hemyock

4.126 Depot, a largely brownfield site within the village is preferred for allocation. This is an infill site, which has a history of untidy and informal uses, including planning permissions which have not been implemented. It is surrounded on all sites by existing modern residential development, and therefore the visual impact is likely to be minimal.

Alternatives

4.127 In Hemyock four sites of Culmbridge Farm, Land north of Culmbridge Farm, Land adjacent Cemetery and SW of Conigar Close are not proposed for allocation. All are greenfield sites,

which would result in the loss of agricultural land (generally grade 3). Given the villages location within the Blackdown Hills AONB, consideration of the impact on the special qualities of the landscape designation is a factor. These four sites all have the potential for some landscape and visual impact. Allocating a smaller proportion of each site, and by use of sensitive design, some impact could be mitigated. However allocating the Depot site, being enclosed within the existing built surroundings of the village, reduces the likelihood of landscape or visual impact associated with other sites. In addition Brookridge Timber yard was promoted as a commercial allocation but was not preferred because of its isolated and unsustainable location, being some distance separated from the village. Policies regarding rural employment development are more permissive now than previously, so such a scheme does not necessarily need to be allocated in order to come forward.

Kentisbeare

4.128 In Kentisbeare a single site was included within the Options Consultation, which received a number of objections during the Options Consultation. This site is an existing allocation which has not come forward since being allocated in 2010. Given that the site has been not progressed since being allocated, it is not proposed that it be retained in the new Local Plan Review.

Alternatives

4.129 There are no alternative, deliverable sites to consider within the village.

Lapford

4.130 A single site option was promoted at Lapford while during the consultation a further option emerged, however since the consultation both landowners have withdrawn their land. As a result no sites are available to be allocated within the village.

Alternatives

4.131 There are no alternative sites to consider.

Morchard Bishop

4.132 In Morchard Bishop three sites have been promoted with preference given to retaining an existing allocation, but with an increased site size. This site is adjacent to modern housing and was clearly the favoured local choice during the Options Consultation.

Alternatives

4.133 Church Street is not preferred as it has the potential for negatively impacting on the conservation area and adjoining listed buildings. This site received the greatest level of objection during the consultation. Tatepath Farm is separated from the main body of the village, being located a distance along a relatively narrow lane. Not being adjacent to existing development, there is the possibility for visual impact as a result of locating residential development in this location, instead of the existing farm buildings, which arguably form part of the rural character, particularly when viewing from the north.

Newton St Cyres

4.134 In Newton St Cyres, three site options were considered. All three sites are unfortunately located on grade 2 agricultural land. Court Orchard, however, is the preferred site as this option has been put forward on the basis that it can also deliver a new school, allowing the school to be moved to a more suitable location, away from the busy A377. A portion of the site is within Flood Zones 2 and 3, however, the policy sets restrictions on which uses are acceptable within these areas.

Alternatives

4.135 The two sites east and west of Tytheing Close are not proposed for allocation. These sites are more visually prominent, being located on higher ground on the east side of the village. The proposed site also facilitates the relocation of the school, which was not an option put forward by the promoters of the other two sites.

Sampford Peverell

4.136 In Sampford Peverell four large sites were promoted through the Options Consultation and two more submitted subsequently, with the potential for a very high number of dwellings, being far in excess of what is likely to be appropriate for a designated village. The former Tiverton Parkway Hotel site is proposed for allocation. This is a modest sized, brownfield site which has lain derelict for a number of years since the previous hotel was demolished. The site is untidy, and though two planning permissions have been granted within the last seven years for a care facility, the site owners have stated they no longer are able to pursue this option. The planning permissions included provision for a new GP surgery. In order to ensure the delivery of this important local facility, it is proposed to the site for a mixed use including housing.

Alternatives

4.137 All the alternative sites within the village would involve the loss of greenfield land, which is either agricultural grades 2 or 3. Higher Town is elevated and therefore has the potential for greater landscape or visual impacts. Land off Whitnage Road (including the additional land put forward at Mount Pleasant) is located adjacent to the A361, sharing a long boundary with this busy road. Such a site therefore has greater potential for negative impacts from noise on the general amenity of future residents, which can be avoided by allocating alternative sites. Morrells Farm adjacent the main road (SHLAA site 3 & 4 combined)is likely to have an impact on the Grade II farmhouse, and would have a detrimental impact on the significance, character and appearance of the conservation area, particularly as the proposed access point requires demolition of a stone frontage wall and a group of traditional farm buildings (all within the conservation area). Mountain Oak Farm is a large site which is slightly divorced from the main body of the village, and does not offer the most logical extension to the built extent. Morrells Farm (SHLAA site 6) is a very large site which has a poor spatial relationship with the village, being out of scale with the settlement and divorced from the main built extent of Sampford Peverell. Though a smaller element of the site could be allocated, there is currently very little development in the vicinity of the site, and as such there is the greater potential for landscape and visual impacts.

Sandford

4.138 In Sandford an enlarged site at Fanny's lane (part of an existing allocation) was promoted and is proposed to be allocated. This site is enclosed on three sites by existing development within the settlement. The site is located on grade 2 agricultural land, however a large proportion of the site is already under construction (i.e. the element already allocated). An access is already in place off the site currently being constructed.

Alternatives

4.139 Only one other deliverable site was put forward within the village. Land at Sandford (west), like the preferred site, is also located on grade 2 agricultural land. However, this site is on one of the most elevated parts of the village, and is steeply sloping throughout. Its elevated position increases the likelihood of greater landscape and visual impacts, which can be avoided by allocating the Fanny's Lane site.

Silverton

In Silverton five sites were promoted, however only two are proposed for allocation. The eastern portion of Land at Old Butterleigh Road is proposed to be allocated for eight dwellings. This site can be accommodated within the existing pattern of built development, having extending in a linear fashion immediately to the north and south. The policy requires that the small area of flood zones 2 and 3 which covers a small area along the eastern boundary should remain undeveloped. The Garage site to the south of Silverton is proposed to be allocated for five dwellings. The site is a brownfield site and is located within the conservation area.

Alternatives

4.140 The western portion of Land at Old Butterleigh Road is not proposed as this would result in the loss of the allotments (which would need to be relocated) and is also generally elevated land, with greater potential for visual or landscape impacts. Glebe is located within the conservation area, which could be negatively affected by locating development in this location. Access to the Livinghayes Road site is limited, as the site is located off a private road which is narrow. Refuse lorries do not currently use the lane, which if developed would result in an unacceptable arrangement for future residents who would need to deposit their refuse on collection days at the junction with Coach Road. Land east of Hederman Close would result in the loss of grades 1,2 and 3 agricultural land. This was also the site which received the greatest level of objection during the Options Consultation.

Thorverton

4.141 In Thorverton two areas of land to the south of the village were put forward (though they were considered as one site for the purpose of initial assessment). Originally entitled 'Glebe' in the Options Consultation, both unfortunately are grade 1 agricultural land. Advice from the highways authority stated that the western portion was preferred given the better pedestrian access. Devon County Council owns the verge on the western side of the C23 to the north, and therefore a continuous footpath can be delivered from the site to connect in with the existing network in Thorverton. The preferred western portion has subsequently been renamed 'Land south of Broadlands'.

Alternatives

4.142 No alternative deliverable sites were put forward for consideration. The eastern portion of 'Glebe' is not proposed for the reasons outlined above.

Uffculme

4.143 Five sites were considered within the village, however none are proposed for allocation.

Alternatives

4.144 Land off Chapel Hill has subsequently been confirmed as unavailable since inclusion in the Options Consultation. Land west of Uffculme would extend the pattern of the village in a linear fashion along the B3440. This is not preferred, particularly as it would result in long walking distances to the village's facilities, in particular the primary and secondary schools. In addition, inspectors have previously drawn attention to the present boundary of the village, to the front of Harvester, being a defined feature beyond which the village should not be extended. Land off Ashley Road, has planning permission on the southern element. The northern part is within the Hillhead Quarry Minerals Consultation Zone, and is also elevated in comparison with the adjacent housing to the east, which could result in overlooking. For these reasons this site is not preferred. Land adjoining Poynings is located within an area of the village which is elevated, and has a more distinctly rural character, with fewer buildings and with access being from the generally narrow Chapel Hill. The potential for change in character and visual and or landscape impacts has determined the decision not to allocate this site. Land adjacent Sunnydene is located at the edge of the settlement, where the nearest dwellings are very low density and is accessed off the narrow Clay Lane. Though technically deliverable, the nature of the location of the site at some distance along the single carriageway lane is considered a sufficient basis not to allocate. A site at Hillhead Quarry was put forward for consideration for commercial development. However, the site is located within the Minerals Consultation Zone, and is considerably divorced from any settlement. For these reasons the site is not proposed for allocation.

Willand

4.145 In Willand, eight residential, commercial or mixed use sites were put forward for consideration including the strategic site Land at J27 and Willand. As a strategic site, Land at J27 has been discussed under S2 Amount and distribution of development. Of the other sites put forward, it is proposed to allocate a portion of Land East of the M5 which includes a small portion of land adjacent to B3181. This site sits alongside modern housing development on flat land with good access. A sufficient quantity of land is allocated, in order to ensure provision of a buffer to mitigate any noise impact from the nearby motorway. Willand Industrial Estate is an existing allocation with a history of planning permissions and commercial development. Part of the site has remained unconsented and therefore the size of the site is proposed to be reduced. However, the location of the site, on the edge of the settlement adjoining existing commercial development is considered a sustainable location for employment growth.

Alternatives

4.146 Other sites at Dean Hill Road and Lloyd Maunder Way (Residential) are divorced from the main body of Willand by the motorway. Quick's Farm is a flat site which scores favourably but

received the greatest level of objection of all sites in the village during the Options Consultation. Land at North East of Four Crosses Roundabout is a large site which would expand the village beyond the boundary currently delineated by the busy roads of the B3181 and B3440. Other sites have a better relationship with the existing pattern of development and can be incorporated more easily, and would not require new residents to cross busy roads in order to access the village's facilities and services. Access to the Lloyd Maunder (commercial) site is over flood zones 2 and 3. Furthermore although some commercial development is provided in Willand, a village location for significant commercial development is less favourable than other locations in the district, such as the towns. Given the commercial development requirement of the Local Plan Review, the cumulative commercial development of Willand Industrial Estate with Lloyd Maunder (Commercial) is not required.

Yeoford

4.147 One site was considered within the village, however this is not proposed for allocation.

Alternatives

4.148 In Yeoford a single site at Land off Lower Road was considered during the Options Consultation. The site is in close proximity to the conservation area, and adjacent to very low density housing. The southern portion of the site is steeply sloping and would overlook dwellings within the conservation area. The immediate road network is also very narrow. The site received a wide number of objections during the Options Consultation. For these reasons, the site is not proposed for allocation. No other deliverable sites within the village were included within the Options Consultation.

Managing Development Policies

Reasons for selecting development management policy alternatives

4.149 The Local Plan Part 3: Development Management Policies (LP3) formed the latest set of adopted development management policies and the baseline position for the Local Plan Review. The Scoping Report consultation recognised that these policies would be newly adopted as the Local Plan Review progressed and that only minor adjustments would be required to amend policies in response to updates to national policy or guidance and any lessons learnt through implementation. This approach was widely supported through consultation.

4.150 The Options Consultation took forward this approach but sought to predict where changes would be required. The most notable changes anticipated would be from the Department for Communities and Local Government (DCLG) consultation on the Housing Standards Review which could impact on a range of policies including; AL/IN/6 Carbon Footprint Reduction (Merton Rule), DM2 High Quality Design (Building for Life), DM3 Sustainable Design (Code for Sustainable Homes), DM14 Design of Housing (Lifetime Homes) and DM15 Dwelling Sizes. Policy DM5 Renewable and Low Carbon Energy would need to be revised to reflect the new Government guidance in July 2013. Amendments were also proposed for DM9 to be replaced by a new Rural Exception sites policy and AL/DE/7 to reflect planning policy for traveller sites. The NPPF introduces the new designation of Local Green Spaces which should be reflected in policy. Self-build or custom build housing was also expected to warrant a new policy. Minor changes to DM16 Town Centre development and DM18 Development outside town centres would be needed to reflect Bampton's proposed change in status from a town to a village.

4.151 Proposed changes in the options consultation alongside other consistency issues have been addressed in the Local Plan Review. The presumption in favour of sustainable development has been deleted as it is no longer required by the Planning Inspectorate. Policy on Sustainable Design has been deleted alongside the Building for life component of Policy High Quality Design in response to the Housing Standards Review proposed by national government. The policy on Waste Management has been deleted at the request of DCC as it is replicated at a higher level within the Devon Waste Plan. The policy on Renewable and Low Carbon energy has been revised. A policy for the cross subsidy of affordable housing on exception sites is deleted. Rural exception sites, now includes low-cost housing. Policy on the Design of Housing has removed lifetime homes standard. The policy on Dwelling Sizes has been amended to reflect national standards. Bampton has been removed as a town from policies on Town centre development and Development outside town centres. Policy on the Protection of recreational land and buildings has been revised to include the protection of Local Green Spaces and makes reference to the role of neighbourhood plans as an alternative route for designation. Policy on Green Infrastructure in Major Development has been revised to remove reference to open space provision which is now included in Policy S5 Public open spaces. Policy on Other protected sites has been revised to make reference to priority protected habitats defined by UK and Devon Biodiversity Action Plans.

4.152 The remaining DM policies have been taken forward largely unaltered with no strategic alternatives identified as policies have generally been developed to reflect the NPPF position, locally or are written to reflect the Local Plan Reviews supporting evidence base. Please note

that the numbering of policies in the Local Plan Review have changed from the Local Plan Part 3: Development Management Policies document due to deletions and amendments of policies during the Local Plan Review process. Please see Appendix 2 for a more detailed description of the assessments.

Managing Development Policies

5 Monitoring

5.1 Monitoring is important to understand the characteristics of the local area, assess the impact of policies and determine whether the strategy is delivering sustainable development so that the policies can be reviewed as appropriate. The Local Plan Review contains local indicators and targets to measure the Council's performance against relevant policies and legislation as well as any significant environmental effects. The monitoring outcomes are reported annually in Mid Devon District Councils' Monitoring Report which provides information on the following matters:

- Progress of local plans including the timetable for completion, stage reached and reasons for any delay;
- Any local plans or supplementary planning documents that have been approved or adopted, including relevant dates;
- Decisions not to implement any Local Plan Review policy including reasons and steps to implement the policy in the future;
- The number of market and affordable dwellings built in the reporting period and since the relevant Local Plan Review policy target was introduced;
- Any neighbourhood plans or development orders made in the district;
- Progress on the implementation of the Community Infrastructure Levy, if any; and
- Actions taken to ensure cooperation with other local authorities and prescribed organisations under the 'duty to cooperate'.

5.2 For convenience the Local Plan Review monitoring indicators, relevant policies and targets are reproduced in the table below.

Monitoring indicators

Indicator	Relevant Policies	Target	Implementation Agencies	Comments
Housing				
Housing trajectory showing net additional dwellings from 2013-2033	S2; S3; S4; S10; S11; S12; S13	Annual completions of 360 dwellings	Development industry, MDDC	
Affordable housing completions; number of dwellings	S1; S3	Annual average completions 100 per year.	MDDC, development industry, registered providers, Housing and Communities Agency	

Indicator	Relevant Policies	Target	Implementation Agencies	Comments
Affordable housing on rural exception sites	S3; DM6	>50% affordable housing	MDDC, development industry, registered providers, Housing and Communities Agency	Proportion of market housing on rural exception sites should be lower than that of affordable housing.
Net additional gypsy and traveller pitches	S3; DM7		MDDC	
Self-build completions	S3	5% on sites of 20+ dwellings	MDDC, development industry	
Sizes and types of dwellings completed	S1; S3; DM13	No target	MDDC, development industry	
Net density of new residential development	S9; DM1	None	MDDC, development industry	Policies do not set minimum housing densities but promote the efficient and effective use of land.
Availability of land for housing	S3; S4	>105% housing supply against requirement	MDDC, development industry	Target applied to whole district. Target will be revised to >120% if persistent under-delivery of housing is proven.
Development of housing on allocated sites	S3 S4 All housing allocations	>50% of completions	MDDC, development industry	
Total amount and percentage of housing development (including conversions) on previously developed land.	S1	No target	MDDC, development industry	
Number of parking spaces provided in new residential developments	DM5	≥1.7 car parking per dwelling	MDDC, development industry	

Indicator	Relevant Policies	Target	Implementation Agencies	Comments
Commercial				
Total amount of additional commercial floorspace for the whole district and individually for Tiverton, Cullompton, Crediton and rural areas	S2; S6; S10; S11; S12; S13; DM14; DM15, DM18	Average annual completions (square metres) Mid Devon 7700 Tiverton 1540 Cullompton 3850 Crediton 770 Rural Areas 1540	MDDC, development industry	Monitoring reports will break down the provision of use classes A1-A5, B1-B8, C1-C2, D1-D2 and sui generis uses.
Development of employment on allocated sites	S6; All commercial allocations	>50% of completions	MDDC, development industry	
Losses of commercial land in local authority area	S6; DM14; DM15; DM19	No Target	Mid Devon District Council, development industry, businesses	Loss of commercial land will be broken down according to use class.
Number of active businesses	S1; S2; S6	Maintain or increase number of active businesses.	MDDC, Heart of the South West Local Enterprise Partnership, private sector	
Job Seekers Allowance as a proportion of working age population each April	S1; S6	Remain below regional average	MDDC, development industry, business sector	Gives indictor for deprivation and employment.
Total amount of floorspace for town centre uses, in total and within town centres (Classes A1, A2, B1a and D2)	S6; S7	No target	MDDC, development industry, retail business sector, leisure industry.	

Indicator	Relevant Policies	Target	Implementation Agencies	Comments
Total amount of floorspace for town centre uses out of town centres (Classes A1, A2, B1a and D2)	S6; DM14; DM15	No target	Mid Devon District Council, development industry, retail business sector, leisure industry.	To monitor edge-of-centre and out-of-centre development, mainly retail.
A1 shops in primary shopping frontages.	S7; DM14	>65%	Mid Devon District Council, development industry, retailers	
Total amount and percentage of commercial floorspace on previously developed land.	S1	No target	MDDC, development industry	
Infrastructure				
Community Infrastructure Levy. Monitor annual receipt of CIL.	S8	No target.	MDDC, development industry	
Public open space provision and accessibililty. Applications complying/failing to comply with quantity and access standards in Policy S5	S1; S5; S8	No target	MDDC, development industry, town and parish councils, Sport England, private and voluntary organisations.	Policy S5 sets out standards for open space provision. Smaller sites may provide financial contributions in lieu of onsite open space, with these funds being directed to the provision or improvement of public open space elsewhere.
Strategic Housing and Commercial Land Availability Assessment	S3; S4; S6	To review SHLAA/SCLAA when the Local Plan is reviewed	MDDC, development industry, infrastructure providers	

Indicator	Relevant Policies	Target	Implementation Agencies	Comments
Services available in towns and rural areas	S8; S10; S11, S12; S13; S14	No reduction in services	MDDC, Devon County Council, other organisations	Services include: Public transport, educational facilities, convenience stores, community halls
Loss of community facilities	S1; DM23	No total loss in settlement	MDDC, development industry	
Environment				
Number of Conservation Area Appraisals and Conservation Area Management Plans	S9	1 new or updated CAA/MP per year	MDDC	
Habitat surveys (where applicable) for consented developments demonstrate no loss in biodiversity.	S1; S9	100%	Natural England, MDDC, development industry	No loss may be achieved through avoidance, mitigation and compensation of impacts.
Developments permitted on protected sites (habitats)	S1; S9; DM28	No target	MDDC, Natural England, development industry	Policy directs development away from protected sites subject to criteria, so the number of consents should be low.
Ecological status of water bodies	S1; S9; DM4	No target	MDDC, development industry, Environment Agency.	Target in South West River Basin Management Plan is to achieve good ecological status for water bodies and protected areas by 2015. The Environment Agency monitors water quality.

Indicator	Relevant Policies	Target	Implementation Agencies	Comments
Consented renewable energy development by type and megawatts.	S1; S9 DM2	No target	Mid Devon District Council, development industry.	
Number of heritage assets added to the local register	DM25	No target	Mid Devon District Council, development industry, English Heritage	
Air Quality Management Areas	S1; S11; S12; DM3; DM4	Reduction in air pollutants within AQMAs	MDDC, development industry, Devon County Council, Highways Agency	
Enforcement				
Number of planning enforcement cases, notices and prosecutions	DM29	No target	MDDC	

6 Conclusions

6.1 The policies and site allocations in the Local Plan Review and the reasonable alternatives considered during its preparation have been subject to a detailed appraisal against the SA objectives which were developed at the scoping stage of the SA process. The SA has played an integral role in the development on the Local Plan Review. It has been used to consider the various strategic options and inform the most sustainable approach for the District. The SA has led to the refinement of policies to minimise adverse impacts and has ensured that sustainability issues for the District are addressed. The wording of the specific site policies seeks to ensure that a potential negative effects resulting from the development of sites is addressed at masterplanning and/or planning application stage. In general, the emerging Local Plan Review has been found to have a wide range of positive and significant positive effects on the objectives both cumulatively and through individual policies, although a number of potentially adverse impacts still remain. Recommendations made in previous iterations of the SA report and this proposed submission SA report has generally been thoroughly addressed, which has provided mitigation for potential adverse effects for both individual policies/proposals and the Local Plan Review as a whole.

6.2 The SA Report will be available for consultation alongside the new Local Plan Review Proposed Submission (February 2015). Following this consultation, all responses will be fully reviewed and addressed where appropriate. Depending on the extent of any changes made to the Local Plan Review, further SA work may need to be undertaken in relation to the Submission version. Any such SA work will either be presented in a SA note, as an addendum to this report, or an updated version of the whole report (depending on the scale of changes to the Local Plan Review). Monitoring will be used to assess both the positive and negative effects of implementing the Local Plan Review.

Appendix 1: Reviewed plans and programmes (full list)

Carbon reduction and air quality	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
The 2008 Climate Change Act	The Climate Change Act sets statutory emissions reduction targets to at least 80% below the level of net UK emissions of targeted greenhouse gases in 1990.
The Carbon Plan: Delivering our Low Carbon Future (HM Government, 2011)	The Carbon Plan sets out how the UK will achieve decarbonisation within the framework of energy policy. Within the next 10 years the plan requires the development and deployment of new technologies that will be needed to halve emissions in the 2020s. Domestic transport emissions account for nearly a quarter of UK emissions; to achieve target vehicles will need to run on ultra-low emission technologies such as electric batteries, hydrogen fuel cells and plug-in hybrid technology. These changes will bring environmental benefits including improved local air quality. Encouraging the use of public transport, cycling or walking will boost the reduction in emissions.
The Air Quality Strategy for England, Scotland, Wales and Northern Ireland – Volume 2 (DEFRA, 2011)	The Air Quality Strategy points to certain pollutants where national objectives are in some cases being met, and others not. Pollutants described include: lead, benzene, 1,3-butadiene, carbon monoxide, particulate matter, nitrogen dioxide, ozone, sulphur dioxide and polycyclic aromatic hydrocarbons. Levels for many of these emissions are closely related to transport use, which planning policies will need to consider means to reduce those reaching unacceptable levels.
The Air Quality (Standards) Regulations 2010	The Air Quality (Standards) Regulations transpose into English legislation the requirements of EU directives on air quality and cleaner air. It sets air quality standards for key pollutants and requires the UK to demonstrate how the standards will be achieved and maintained when compliance is breached. Particular attention is given to reducing particulate matter, a pollutant associated with transport emissions, exposure to which can exacerbate existing respiratory conditions.
National Planning Policy Framework (DCLG, 2012)	The NPPF requires local authorities to encourage solutions that result in reductions in greenhouse gas emissions and promote sustainable transport. Local plans should aim to minimise pollution, and should prevent new and existing development from contributing to or being adversely affected by unacceptable levels of air pollution.
Code for Sustainable Homes (DCLG, 2010)	Category 6 of the Code for Sustainable Homes aims to reduce the emissions of gases with high global warming impact associated with the manufacture, installation, use and disposal of foamed thermal and acoustic insulating materials. Building elements affected include roofs, walls, floors, hot water cylinders, cold water storage tanks and external doors. Credits towards achieving levels of the code can be achieved by reducing the use of materials with a high global warming impact. Application of the code is one method for

	reducing emissions at point of manufacture, installation and disposal. Such actions can contribute to the achievement of building sustainable homes.
Housing Standards Review	Government considered a range of issues in the Housing Standards Review consultation. The Government subsequently considered a Technical consultation for a Nationally described Space Standard. These standards are reflected in the Local Plan in DM13 Housing sizes.
Local Transport Plan 3, Devon and Torbay Strategy 2011-2026 (Devon County Council, 2011)	The Devon Local Transport Plan states that technology has a key role to play in reducing emissions which affect air quality. To support the market for electric vehicles it requires a network of charging points to be delivered in convenient locations for residents. Capital priorities include improving air quality in Cullompton and Crediton through the delivery of relief/link roads.
Mid Devon Corporate Plan 2012-2015	The Mid Devon Corporate Plan notes that there are areas of poor air quality within the district, especially within the Exeter Road area of Crediton, and Cullompton High Street and Station Road. The Local Plan will need to consider how new development impacts on existing, and areas at risk of poor air quality.
Mid Devon Sustainable Community Strategy 2010-15	There are air quality issues within Crediton and Cullompton. Tackling these is a priority.
Renewable Energy, Carbon & Air Quality Study (ARUP, June 2014)	It can be seen that whilst there are important considerations in respect of energy efficiency, renewable energy, air quality and low emission strategies, these do not generally differentiate between the draft policy options on potential site allocations. Policies associated with the concentration of development around existing built development are likely to favour improved integration of renewable energy and also assist in the most optimum public transport options, which will help with the development of low emission strategies. Air quality factors are likely to count against this – as air quality considerations would naturally lead towards a "dispersal" rather than a "concentration" approach to site allocations.
Review of Preferred Sites Outlined for the Local Plan, Air Quality Assessment (ARUP, July 2014)	A more detailed assessment of air quality effects on AQMAs and the wider area of commercial development at Junction 27 and mixed use development at Junction 28. The assessment concluded that by the future assessment year of 2033, existing air quality will have improved from current levels due to improvements in vehicle fuel technologies and cleaner vehicles entering the fleet. An Assessment of cumulative local air quality impacts of the preferred development sites. Predicted total pollutant concentrations at assessed receptors, including those within the Crediton and Cullompton AQMAs, were well below the annual mean NO2 and PM10. The greatest effect occurs along the A373 and is associated with the East Cullompton preferred site. No significant cumulative air quality effects are anticipated as a result of the development of preferred sites to be taken forward in the Local Plan.
Air quality – sustainability conclusions All the air quality-related policies/strategies reviewed emphasise the need to reduce emissions as a key action to mitigate the effects of climate change.	

Reducing emissions is also a requirement in areas that suffer from poor air quality, such as in Crediton and Cullompton. Reviewed policies also encourage increasing the use of low carbon vehicles as part of a strategy to reduce emissions. These messages must be clearly reflected within the new Local Plan. The document should ensure that new development does not unacceptably contribute to poorer air quality, and that opportunities for reducing emissions are incorporated. New development should encourage the use of sustainable modes of transport, such as walking, cycling or the use of public transport. New development should also help to promote the market for low carbon vehicles by ensuring the delivery of electric vehicle charging infrastructure, or other latest technological infrastructure needed for low emission transportation.

Biodiversity and green infrastructure	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
European Water Framework Directive (European Commission, 2000)	The European Water Framework Directive (WFD) came into force in December 2000 and became part of UK law in December 2003. It provides an opportunity to plan and deliver a better water environment, focusing on ecology. It provides an opportunity to plan and deliver a better water environment through river basin management planning.
'The Natural Choice' Natural Environment White Paper (DEFRA, 2011)	The paper set out a framework for protecting and enhancing the natural environment. It proposed the introduction of Nature Improvement Areas, in order to provide bigger, connected sites for wildlife to live in and adapt to climate change in both urban and rural areas. Local Nature Partnerships. It also proposed new ways for developers to provide biodiversity offsetting, to ensure wildlife sites are not lost. Also proposed were Local Nature Partnerships to strengthen joined up action across local agencies and government.
Natural Environment and Rural Communities Act 2006	The act places a duty on public authorities (replacing s74 of the Countryside and Rights of Way Act 2000) to have regard to biodiversity as far as is consistent with the proper exercise of their functions. The act also requires the government to publish, review and revise lists of living organisms and types of habitats in England that are of principal importance for the purpose of conserving biodiversity.
Countryside and Rights of Way Act 2000	Requires local authorities to have regard to nature conservation when performing rights of way functions, including power to divert ROWs away from SSSIs. The act gives greater protection to wildlife and natural features by making provisions for the conservation of biodiversity, and improving protection for SSSIs.
Wildlife and Countryside Act 1981	The act sets in place protective measures for wildlife, including wild birds and plants. The act requires local authorities to take steps to bring the protection of wildlife to the attention of the public and schoolchildren. The act (though subsequently amended) allows designation of Sites of Scientific Interest (SSSIs) setting their management and protection measures, and also allows the designation of national nature reserves.

Conservation of Habitats and Species Regulations 2010 (and Amendment 2012)	Translates the EU 'Wild Birds Directive', requiring the protection of biodiversity through the conservation of natural habitats and species of wild fauna and flora. It places a new duty on relevant authorities to protect and create bird habitats, and a duty to avoid pollution or deterioration of bird habitats. The document also states the list of European protected species of animals and plants. The regulations require land use to plans that are likely to have a significant effect on a European site to make an appropriate assessment of the implications for the site in view of the site's conservation objectives. The local authority may only give effect to the land use plan after having ascertained that it will not adversely affect the integrity of the European site.
Biodiversity 2020: A strategy for England's wildlife and ecosystem services (DEFRA, 2002)	The strategy sets a mission for the next decade requiring a halt to overall biodiversity loss, support to healthy well-functioning ecosystems and to establish coherent ecological networks, with more and better places for nature for the benefit of wildlife and people. In particular, reducing environmental pressures on biodiversity is a specific concern. This will be undertaken through reforms of the planning system to ensure a strategic approach to planning for nature will be undertaken. The protection and improvement of the natural environment is a core objective of the planning system. Biodiversity offsetting will be piloted to assess its potential to deliver planning policy more effectively. Particular targets (to be achieved by 2020) include 90% of priority habitats in favourable or recovering condition, and at least 50% of SSSIs in favourable condition, while maintaining at least 95% in favourable or recovering condition. Additional targets include bigger and less fragmented areas for wildlife, with no net loss of priority habitat and an increase in the overall extent of priority habitats by at least 200,000ha.
England Biodiversity Strategy – Climate Change Adaptation Principles (DEFRA, 2008)	The document sets out principles for conserving biodiversity and protecting them from the direct and indirect impacts of climate change. The principles include conserving existing biodiversity, conserving protected areas and all other high quality habitats, conserving the range and ecological variability of habitats and species, maintaining existing ecological networks, creating buffer zones and high quality habitats, understand change is inevitable, make space for the natural development of rivers and coasts and raise awareness of the benefits of the natural environment to society.
National Planning Policy Framework (DCLG, 2012)	The planning system should contribute and enhance the natural and local environment by recognising the wider benefits of ecosystem services; by minimising impacts on biodiversity and providing net gains in biodiversity where possible, contributing to the Government's commitment to halt the overall decline in biodiversity by establishing coherent ecological networks that are more resilient to current and future pressures. Distinctions in policies should be made between the hierarchy of international, national and locally designated sites, so that protection is commensurate with their status. Policies should plan for biodiversity on a landscape wide scale; promote the preservation, restoration and re-creation of priority habitats, ecological networks and the protection and recovery of priority species.
Code for Sustainable Homes (DCLG, 2010)	Category 9 (ecology) states that development can meet this element of the code by promoting the use of land that already has limited value to wildlife, and to discourage it from developing ecologically valuable sites.
Housing Standards Review	Government considered a range of issues in the Housing Standards Review consultation. The Government subsequently considered a Technical consultation for a Nationally described Space Standard. These standards are reflected in the Local Plan in DM13 Housing sizes.

South West River Basin Management Plan (Environment Agency, 2009)	The plan is prepared under the European Water Framework Directive, which requires all EU countries throughout the European Union to manage the water environment to consistent standards. Priorities for local government include ensuring that local planning document take into account the objectives of the SWRBMP, actions to reduce the physical impacts of urban development on artificial or heavily modified water bodies, promotion of the use of sustainable urban drainage systems and promote sustainable water management best practice through pre-application discussions with developers.
The Nature of Devon – A Biodiversity and Geodiversity Action Plan (Devon County Council, 2005)	Objectives of the action plan include ensuring that planning policies recognise the importance of biodiversity and the geological features of Devon, to ensure consideration is given to nature conservation issues in the implementation of planning, to reconcile the objectives of bio- and geodiversity conservation with the need for economic and social development in achieving environmental sustainability and to maintain a dialogue with relevant authorities leading to the identification of all sites of national or international geological heritage which do not benefit from SSSI status.
Devon Sustainable Community Strategy 2008-18	The natural environment of Devon needs to be sustained and should continue to be a priority for all those involved in planning for the future.
Mid Devon Habitats Regulation Assessment (2014)	The HRA of the Mid Devon Local Plan Review (Publication Draft version) has been undertaken in accordance with currently available guidance and based on a precautionary approach as required under the Habitats Regulations. The overall HRA findings reached during the Appropriate Assessment stage have been summarised, and the justification for these is explained in more. The HRA conclusions and recommendations can be summarised as providing that the identified mitigation is implemented, adverse effects on the integrity of all European sites around Mid Devon from policy and site options in the new Local Plan (alone or in combination) will not occur in relation to: Air pollution, Changes to water quality or quantity, Physical loss or damage to offsite habitat, or noise/vibration and light pollution and Recreation.
Mid Devon Green Infrastructure Plan (2013)	The Green Infrastructure Plan promotes a network of multi-functional green space with recreational, visual and biodiversity value. It identifies existing GI assets at the landscape scale and by catchment areas within Mid Devon. GIP objectives are to promote sustainable growth and economic development, to encourage health and well-being, to adapt to mitigate climate change and to improve biodiversity.
Mid Devon Playing Fields Strategy (2010)	Priority action points include: using the development of new and replacement schools as a catalyst for appraising and improving playing field facilities; to adopt and/or continue strong statutory policies protecting existing pitches, including those on education sites; and when planning new and improved facilities, to look holistically at the whole settlement's sporting provision – embracing public, private and education landowners.
Mid Devon Sustainable Community Strategy 2010-15	Mid Devon is a beautiful area with a high quality natural environment, bordering two national parks and the Blackdown Hills AONB, whilst there are also many Sites of Special Scientific Interest, county wildlife sites and local nature reserves. Development will need to be balanced against the priority of maintaining and enhancing the natural environment.

Biodiversity and green infrastructure – sustainability conclusions
The biodiversity and green infrastructure plans and strategies reviewed have at heart the need to conserve and enhance biodiversity. Policies should avoid the deterioration of habitats, and look to preserve, restore and recreate priority habitats, with no net loss in priority habitats. Development should provide net gains in biodiversity where possible, balancing the economic and social needs of development with the objectives of bio- and geo-diversity conservation. Policies should also give consideration to biodiversity enhancing development. Policies should take a holistic approach to the provision of playing fields, considering all public and private landowners.

European sites	
Plans/programmes/ strategies reviewed	**Key messages for the Local Plan and SA**
West Somerset Local Plan to 2032 (Revised Draft Preferred Strategy)	The HRA Report for the West Somerset Local Plan: Draft Preferred Strategy (January 2012) concluded that, provided a number of specific measures were incorporated into the final Local Plan, the Plan would be unlikely to have a significant effect on any European sites. These additions (including the addition of policies relating to a bat consultation zone and a wetland birds consultation zone) appear to have been incorporated into the Revised Draft Referred Strategy. Therefore, in-combination effects with the Mid Devon Local Plan Review are not expected.
North Devon and Torridge Publication Draft Local Plan (June 2014)	The HRA Report for the Publication Draft Local Plan (June 2014) identified a number of potential significant effects on European sites that may occur; however recommendations for mitigation have been incorporated into the Plan and in light of those amendments, the HRA report concludes that the Local Plan is acceptable in terms of its impacts on European sites. Therefore, in-combination effects with the Mid Devon Local Plan are not considered likely.
West Devon Adopted Core Strategy (2006-2026)	No HRA work appears to be available for the 2006 adopted Core Strategy; therefore it is not currently possible to determine the likelihood of in-combination effects with the Mid Devon Local Plan.
Adopted Teignbridge Local Plan 2013-2033 (May 2014)	The HRA report for the Proposed Submission version of the Local Plan (June 2013) concluded that in the absence of mitigation measures, adverse effects on European sites cannot be ruled out. However, the report made a number of specific recommendations for mitigation and these appear to have been incorporated into the Submitted Local Plan. In light of those amendments, it is concluded that significant effects from the Local Plan are not likely and therefore in-combination effects with the Mid Devon Local Plan are also not considered likely.
East Devon Local Plan 2006 – 2026	The HRA Screening Report for the Core Strategy (now referred to as the Local Plan) in August 2010 concluded that significant effects on European sites could not be ruled out in relation to a number of the options for the Plan that were set out at that stage, and that

(Proposed Submission Publication, November 2012)	Appropriate Assessment would be required in order to consider these in more detail. No more recent HRA work appears to be available for the 2006-2026 Proposed Submission Publication Local Plan; therefore it is not currently possible to determine the likelihood of in-combination effects with the Mid Devon Local Plan.
Taunton Deane (Adopted Core Strategy 2011-2028)	The HRA report for the Taunton Deane Core Strategy (May 2011) concluded that, provided a number of specific mitigation measures were incorporated into the final version of the Core Strategy, significant effects on European sites were not considered likely. Those amendments appear to have been incorporated into the final version of the Plan; therefore in-combination effects with the Mid Devon Local Plan are also not considered likely.
Taunton Deane Site Allocations and Development Management Plan Preferred Options (Consultation ended December 2013)	Habitats Regulations Assessment for the emerging Site Allocations and Development Management Plan does not yet appear to have been undertaken; therefore it is not yet possible to draw any conclusions about the potential for in-combination effects with the Mid Devon Local Plan.
Exmoor National Park Draft Local Plan (Consultation ended December 2013)	The HRA report for the Draft Local Plan (October 2013) concluded that, provided a number of specific mitigation measures are incorporated into the final Local Plan, it is unlikely to have a significant effect on the conservation objectives of European sites. Therefore, in-combination effects with the Mid Devon Local Plan are also not considered likely at this stage although it will be necessary to review the next iteration of Exmoor's Local Plan to ensure that the recommendations are addressed.
Dartmoor National Park Adopted Core Strategy (2008)	The HRA Report for the Core Strategy (2008) concluded that, in light of the mitigation measures already in place, the Core Strategy would not have significant effects on any European sites. Therefore, in-combination effects with the Mid Devon Local Plan are also not considered likely.
Dartmoor National Park Adopted Development Management and Delivery Development Plan Document (2013)	The HRA Report for the Development Management and Delivery DPD (2013) concluded that, in light of the mitigation measures already in place, the DPD would not have significant effects on any European sites. Therefore, in-combination effects with the Mid Devon Local Plan are also not considered likely.
Exeter City Council Adopted Core	The HRA Report for the Core Strategy (2010) concluded that the Core Strategy will not have a significant negative effect on any European sites provided that all of the recommended measures set out in the HRA report are implemented. Those measures

Strategy (2012)	appear to have been incorporated into the final version of the Core Strategy; therefore in-combination effects with the Mid Devon Local Plan are not considered likely.
Exeter City Council Draft Development Delivery DPD (2013)	Habitats Regulations Assessment for the emerging Development Delivery DPD does not yet appear to have been undertaken; therefore it is not yet possible to draw any conclusions about the potential for in-combination effects with the Mid Devon Local Plan.
The Devon Waste Plan (Tracked Changes Version Incorporating Proposed Main and Additional Modifications, August 2014)	The HRA Screening Report for the Options consultation paper (January 2012) screened the options and did not identify any options that were considered likely to have a significant effect on European sites, either alone or in combination with other plans and strategies. However, a number of the options were found to have potential effects but it was considered that the effects will be more appropriate for lower tier assessments, e.g. the assessment of specific minerals sites. For those options, European sites that could be affected included Dartmoor SAC, Culm Grassland SAC, East Devon Pebblebeds SAC/East Devon SPA, South Hams SAC, South Dartmoor Woods SAC, Plymouth Sounds & Estuaries SAC, Prawle Point to Plymouth Sound cSAC. Such effects would need to be subject to HRA at a lower tier of plan-making. Therefore in-combination effects with the Mid Devon Local Plan cannot be ruled out and will need to be considered in relation to these lower tier plans and associated HRA work.
Devon and Torbay Local Transport Plan 3 2011-2026	The Appropriate Assessment Report for the LTP3 (April 2011), provided the identified mitigation measures are implemented in full, it will be possible to conclude that the integrity of Natura 2000 sites would be maintained and the conservation objectives would be sustained across the County. Therefore in-combination effects with the Mid Devon Local Plan are not considered likely.
Somerset Future Transport Plan 2011-2026 (Somerset County Council)	The HRA Report for the Somerset Future Transport Plan (October 2010) screened the policies contained in the Plan and make a number of recommendations for policy amendments and/or additions to ensure compliance with the Habitat Regulations before submission. In light of those amendments, it could be concluded that the Plan would have no significant effects on European sites. Those amendments appear to have been incorporated into the final version of the Plan; therefore in-combination effects with the Mid Devon Local Plan are not considered likely.
European sites – Sustainability conclusions The HRA of the Mid Devon Local Plan Review (Publication Draft version) has been undertaken in accordance with currently available guidance and based on a precautionary approach as required under the Habitats Regulations. Provided that the identified mitigation is implemented, adverse effects on the integrity of all European sites around Mid Devon from policy and site options in the new Local Plan alone will not occur in relation to: air pollution, changes to quality or quantity, physical loss or damage to offsite habitat or noise/vibration and light pollution, recreation. A number of recommendations for the Local Plan were made in an earlier draft of the HRA which have been address in the Local Plan this included the specific reference to the protection of European sites, traffic assessment work and discussion with South West Water that proposed growth can be accommodated without exceeding the capacity of sewage treatment works and available water supply. However, because of uncertainties that exist regarding the potential for the North Devon and Torridge Local Plan to have significant effects on the integrity of the Culm Grasslands SAC as a result of increased air pollution, it is not yet possible to conclude that there will be no likely significant effects as a result of implementing the new Mid Devon local Plan in-combination with the North Devon and Torridge Plan. Further work has been commissioned to determine this impact; the Habitat Regulations Assessment will be updated to reflect the latest	

evidence.

Climate change mitigation and energy	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Climate Change Act 2008	The act sets a framework for the UK to achieve its long-term goals of reducing greenhouse gas emissions and ensures steps taken towards adapting to the impact of climate change. The act sets statutory emissions reductions targets to be achieved by 2050 and beyond. The act sets out procedures for assessing the risks of the impact of climate change and requires Government to develop an adaptation programme which contributes to sustainable development.
The Carbon Plan: Delivering our Low Carbon Future (HM Government, 2011)	The Carbon Plan sets out how the UK will achieve decarbonisation within the framework of energy policy. Within the next 10 years the plan requires the development and deployment of new technologies that will be needed to halve emissions in the 2020s. By 2050, all buildings will need to have an emissions footprint close to zero, using better insulation, energy-efficient products and having heating from low carbon sources. Manufacturing processes will need to deliver a fair share of emissions cuts. By 2050 emissions from the power sector will need to be close to zero, electricity likely being delivered by wind farms, nuclear power stations and gas and coal-fired power stations.
UK Renewable Energy Roadmap (DECC, 2013)	The UK has made very good progress against the 15% target introduced in the 2009 EU Renewable Energy Directive. In 2012, 4.1% of UK energy consumption came from renewable sources, up from 3.8% in 2011. In Quarter 2 of 2013, renewables accounted for a record 15.5% of all electricity generated. This represents a significant increase in generation since the publication of the last Update. Overall capacity has grown by 38% over the period July 2012 to June 2013 and now stands at 19.5 GW. This, alongside a healthy set of deployment pipelines, demonstrates the progress that is being made to decarbonise our economy and secure our future electricity supply.
UK Government Sustainable Development Strategy (2005)	The strategy for sustainable development aims to enable all people to satisfy their basic needs and enjoy a better quality of life without compromising the quality of life for future generations. The strategy sets out measure to realise the vision of sustainable communities within England, in both urban and rural areas, which will ensure the delivery of sustainable development, by placing it at the centre of the planning system.
National Planning Policy Framework (DCLG, 2012)	Planning plays a key role in helping shape places to secure radical reductions in greenhouse gas emissions, minimising vulnerability and providing resilience to the impacts of climate change, and supporting the delivery of renewable and low carbon technologies. Local authorities should adopt proactive strategies to mitigate and adapt to climate change. To support the move to a low carbon future, plan for new development in locations and ways to reduce greenhouse gas emissions; actively support energy efficiency improvements to existing buildings; set standards that are consistent with Government's zero carbon buildings policy. New

	development should consider the inclusion of decentralised energy supplies; take account of landform, layout, building orientation, massing and landscaping to minimise energy consumption. To increase the use and supply of renewable and low carbon energy developments all communities should contribute to their generation.
Planning Practice Guidance – Renewable and Low Carbon Energy (DCLG, March 2014)	The guidance assists local councils in developing policies for renewable energy in their local plans, and identifies the planning considerations for a range of renewable sources such as hydropower, active solar technology, solar farms and wind turbines. Increasing the amount of energy from renewable and low carbon technologies will help to make sure the UK has a secure energy supply, reduce greenhouse gas emissions to slow down climate change and stimulate investment in new jobs and businesses. Planning has an important role in the delivery of new renewable and low carbon energy infrastructure in locations where the local environmental impact is acceptable.
Planning Practice Guidance – Minerals (DCLG, March 2014)	Guidance on the planning for mineral extraction in plan making and the application process. Oil and gas (hydrocarbons) underpin key aspects of modern society, supplying energy to power industry and heat homes, fuel for transport to carry goods and people all over the world, and raw materials to produce everyday items. Hydrocarbons remain an important part of the UK's energy mix whilst the country transitions to low carbon energy supplies. This guidance provides advice on the planning issues associated with the three phases of extraction of hydrocarbons.
Code for Sustainable Homes (DCLG, 2010)	Category 1 (energy and carbon dioxide emissions) of the code aims to limit CO_2 emissions arising from the operation of a dwelling, improving the fabric energy efficiency of dwellings, encouraging the specification of low and zero carbon energy sources, promotion of cycling and the need for cycle storage. Category 3 (materials) aims to specify the use of materials with lower environmental impacts over their life-cycle.
Housing Standards Review	The Government propose a "Building Regulations only" approach, with no optional additional local standards in excess of the provisions set out in Part L of the Regulations. In Budget 2013 the Government reaffirmed its commitment to implement the zero carbon homes policy for new homes from 2016. This will be achieved through a strengthening of the energy performance requirements in Part L of the Building Regulations (incorporating carbon compliance, energy efficient fabric and services), and the delivery of allowable solutions.
Housing Standards Review Consultation (DCLG, August 2013)	It was a fundamental review of the building regulations framework and voluntary housing standards which aimed to rationalise the large number of codes, standards, rules, regulations and guidance that add unnecessary cost and complexity to the house building process - while delivering quality, sustainability, safety and accessibility. The review was undertaken by a wide range of cross sectoral stakeholder working groups and this consultation sets out their proposals on: accessibility, space, security, water efficiency, energy, indoor environmental standards, materials and process and compliance.
Devon Sustainable Community Strategy 2008-18	The county needs to reduce its carbon emissions, and incorporate necessary adaptations to manage the effects of climate change into new developments.

Climate change mitigation and energy – sustainability conclusions
The UK is committed to achieving targets in reducing greenhouse gas emissions in order to tackle climate change. Development has a significant part to play to help achieve these targets for reducing carbon emissions. Planning needs to minimise vulnerability to the impacts of climate change, and support the delivery of renewable and low carbon energy development. Improving the energy efficiency of the fabric of buildings, particularly by encouraging low or zero carbon energy sources will limit CO_2 emissions.

Community and wellbeing (including equalities and health)	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Localism Act 2011	The aim of the act was to devolve more decision making powers from central government to local communities. The act contained a number of changes to the planning system, including the abolition of the regional strategies and the new 'duty to cooperate'. The act contains more rights for communities, including the community right to bid for assets of community value, community right to build, and neighbourhood planning.
Lifetime neighbourhoods (DCLG, 2011)	The report contains guidance on the design of neighbourhoods to make them inclusive regardless of age or disability. The components that make up lifetime neighbourhoods include good access (enabling residents to get out and about in the area they live), services and amenities (neighbourhoods with a mix of residential, retail and employment uses and access to services including health, post officer, banking facilities or cash machines), safe and inclusive built environments, with locally accessible greenspace and a range of affordable housing choices (based on inclusive design principles with adaptable space/layout to meet changing needs).
Laying the Foundations: A Housing Strategy for England (HM Government, 2011)	Housing and planning policies should widely positively reflect the wide range of circumstances and lifestyles of older people, who already occupy nearly a third of all homes. Planning for homes and communities where older people can remain involved with their families, friends and communities and able to choose where and how they live. New housing developments need to make suitable provision for ageing populations in the long-term, ensuring a mix of property types, including Lifetime Homes.
National Planning Policy Framework (DCLG, 2012)	Planning policies should aim to achieve places which promote opportunities for meetings between members of the community, including through mixed-use developments, strong neighbourhood centres and active street frontages; safe and accessible developments; high quality public space, which encourage the active continual use of public areas. Policies should deliver the social, recreational and cultural facilities and services the community needs, to enhance the sustainability of communities and residential environments; should guard against the unnecessary loss of valued facilities and services; ensure that local facilities can develop in a sustainable manner; and ensure an integrated approach to considering the location of housing, economic uses and

	community facilities and services. Local authorities should take a proactive, positive and collaborative approach to ensuring sufficient choice of school places to meet community needs. Access to high quality open spaces and opportunities for sport and recreation can make an important contribution to the health and well-being of communities.
Planning Practice Guidance – Neighbourhood Planning (DCLG, March 2014	Provides advice on the neighbourhood planning system introduced by the Localism Act including key stages and decisions (e.g. deciding neighbourhood areas, the legal tests for neighbourhood plans, and the process of independent examination and referendum).
Code for Sustainable Homes (DCLG, 2010)	Category 7 of the code (health and well-being) aims to provide homes that promote good daylighting thereby improving quality of life, improved sound insulation to reduce noise complaints from neighbours, provision of inclusive outdoor space which is at least partially private and construction of homes that are easily accessible and adaptable.
Housing Standards Review	Local authorities should plan for the current and future housing needs of a wide range of households including older and disabled people. Subject to Parliamentary approval of the necessary amendments to the Building Act 1984, Part M (access to and use of dwellings) of the Building Regulations will be amended to include two optional requirements which set out alternative provisions for accessibility and adaptability which can help to meet the needs of older and disabled people. The Government believe that it is right that local communities and neighbourhoods have the ability to shape the nature of new development in their local areas. However, a proliferation of localised and varying space standards creates a potentially significant barrier to delivery of housing. A new national standard is proposed – not a Building Regulation - which will offer a consistent set of requirements with regard to the internal area of new homes. This will have one set of specifications, based on a consolidation of existing space standards used by authorities across the country. Application of the standard will be optional for local authorities to use and they will need to justify its application according to evidenced needs and subject to local plan viability testing. This will help to balance the needs of local communities whilst ensuring that the home building industry can deliver at volume in a cost effective manner. The Government recognises the value of a single minimum security standard for new homes, based on industry's best practice. The Government is considering the evidence on whether such a standard should be applied to all new homes, as a Building Regulation applied nationally or whether it would be more proportionate if applied on a local basis.
Devon Sustainable Community Strategy 2008-18	The strategy values diversity, using equality of opportunity for everyone as a guiding principle. Another guiding principle is the need to improve access to services and opportunities. There is a wide range in life expectancy between different communities, whilst Devon has a higher proportion of older people than the rest of the South West, with the number of older people due to reach one third of the population in the next 15 years. People will also need the opportunities to influence decision making which affects them.

Mid Devon Corporate Plan 2012-2015	'Better Homes' and 'Empowering our Communities' are objectives of the plan. Actions to meet the objectives include working with partners to provide extra care schemes in Tiverton and Cullompton, improve the most deprived areas of the district, work with partners to look at issues around rural isolation and access to services.
Mid Devon Sustainable Community Strategy 2010-15	The population of the district has grown by 20% over the last 20 years and much of this increase is down to inward migration from other parts of the UK. The largest increase is among those of retirement age, and meeting the service needs of the ageing population is a priority. There also needs to be good quality education and leisure facilities for children and young people.
Community and wellbeing – sustainability conclusions The reviewed plans and strategies set out the importance of delivering an integrated approach to new development. Building mixed inclusive communities, around a strong neighbourhood centre, with a mixture of housing, economic uses, community uses and services is a priority. Access to services, the creation of safe neighbourhoods and the availability of local greenspace and quality education and leisure facilities for young people are vital in the creation of healthy, inclusive communities. The provision of accessible, adaptable properties also allows older residents or those with disabilities to remain in their communities, close to family and friends, rather than having to move as their needs change. Residents should be able to influence decisions that affect them.	

Economy and employment	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
The Plan for Growth (HM Treasury/BIS, 2011)	The Government's economic policy objective is to achieve strong, sustainable and balanced growth evenly shared across the country and between industries. Goals include making the UK one of the best places in Europe to start, finance and grow a business (through the implementation of a presumption in favour of sustainable development, liberalisation of use classes and guarantees on planning application decision timetable) and encouraging investment and exports as a route to a more balanced economy (including through increased investment in low carbon technologies).
The Government's Response to the Mary Portas Review (DCLG, 2012	High Streets have been left in a fragile state as people opt to visit out-of-town centres offering free parking and a range of outlets, or choose to do their shopping online. High Streets cannot rely on retail alone, and need to offer something new and different.
National Planning Policy Framework	The planning system should do everything it can to support sustainable economic growth, by planning proactively to meet the needs of business and support an economy fit for the 21st century. Local authorities should set out a clear economic vision and

(DCLG, 2012)	strategy for their area, and set criteria or identify strategic sites for local and inward investment to meet anticipated needs. Local authorities should also support existing business sectors, whether expanding or contracting and be flexible in accommodating needs not anticipated in the plan. Long term protection of sites not likely to come forward for employment should be avoided.
Heart of the South West Local Enterprise Partnership (LEP) Business Plan	Objectives include promoting infrastructure to connect markets. Priorities include addressing existing and future constraints on business growth (emphasising the need for ongoing public and private investment to improve connections into and within the area where current connectivity is impacting on productivity and competitiveness), encouraging the roll out of future electronic communication technologies for the region, encourage a joined up approach to future housing development to secure economic prosperity (including social infrastructure and appropriate affordable housing), ensure an integrated approach to economic development recognising the constraints the planning system can place on business growth, particularly affecting rural businesses wishing to expand.
Heart of the South West Local Enterprise Partnership (LEP) Strategic Economic Plan 2014-2030 & Growth Deal 2015/16	Key to our strategy is that taking advantage of transformational opportunities should have a lasting local legacy and create area-wide benefit. This approach has been translated into three core aims. Creating the conditions for growth by Infrastructure and services to underpin growth (transport infrastructure, broadband and mobile connectivity, skills infrastructure), Maximising Productivity and Employment by stimulating jobs and growth across the whole economy to benefit all sectors (including tourism, agriculture and food and drink) and Capitalising on our Distinctive Assets by Utilising our distinctive assets to create higher value growth and better jobs (transformational opportunities, strengthening research,). The Growth Deal does not attempt to take forward all of the Strategic Economic Plan priorities, instead it focuses its attention on those priorities, where support from Government, either through the Local Growth Fund, or through other freedoms and flexibilities, can be most beneficial now.
Devon Sustainable Community Strategy 2008-18	The conditions need to be created for the county to have a strong and growing economy, ensuring maximum opportunities are available for everyone to contribute and benefit from it. There needs to be sustained investment, including in business infrastructure, communications and transport infrastructure, whilst the development of the knowledge economy should be encouraged.
Mid Devon Corporate Plan 2012-2015	'Thriving economy' is one aim of the corporate plan, in order to create a prosperous economy, sure and well-paid jobs and a sustainable environment. The aims are to increase inward investment, provide start up, relocation and expansion opportunities for businesses, provide opportunities and support to new and existing businesses and regenerate and improve the market towns.
Mid Devon Economic Development Strategy (2012)	Priorities include: increasing inward investment in the district; providing start up, relocation and expansion opportunities for businesses; provision of opportunities to support new and existing businesses; regenerating and improving the market towns; and raising skill levels, education attainment and income.
Mid Devon Sustainable Community Strategy	The economy of the district is dominated by retail and manufacturing businesses primarily focused on the three market towns. Encouraging businesses to set up or locate within Mid Devon by providing sufficient land for development is a priority. Work needs to be undertaken with local businesses to reduce the number of empty shops in the market towns.

2010-15	
Economy and economic development – sustainability conclusions The planning system should support the development of strong, sustainable and balanced economic growth. Opportunities for meeting the needs of local and inward investment should be met by facilitating the growth of local businesses, both urban and rural, and providing sufficient land for employment. There should be sustained investment in business and transport infrastructure to improve connectivity. The regeneration of the market towns of the district should be supported with a particular aim to reduce the number of empty shops.	

Historic environment	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
National Heritage Protection Plan (English Heritage, 2012)	The plan seeks to ensure that England's historic environment is not needlessly at risk of damage, erosion or loss; is experienced, understood and enjoyed by local communities; contributes to sustainable and distinctive places to live and work; and helps deliver positive and sustainable economic growth.
National Planning Policy Framework (DCLG, 2012)	Local authorities should set out a positive strategy for the conservation and enjoyment of the historic environment, recognising that heritage assets are irreplaceable, and should be conserved in a manner appropriate to their significance.
The Historic Environment in Local Plans – Consultation Draft (English Heritage, July 2014)	The purpose of this English Heritage Good Practice Advice note is to provide information on good practice to assist local authorities, planning and other consultants, owners, applicants and other interested parties in implementing historic environment policy in the National Planning Policy Framework (NPPF) and the related guidance given in the National Planning Practice Guide (PPG).
Mid Devon Sustainable Community Strategy 2010-15	The district has a rich cultural heritage with many listed buildings, conservation areas and scheduled monuments. The district will need to balance development with the need to maintain and enhance the built environment.
Killerton Park Setting Study (Land Use Consultants, 2013)	The document sets out a 'zone of potential influence' around the historic park and garden which delineates its setting. The document identifies discrete areas within the setting that have a high significance to Killerton Park, and where impacts on the setting of the historic asset are most likely to occur.
Knightshayes Setting	The document describes the setting for the historic park and garden, which it states extends beyond the visual envelope, and

This page is intentionally left blank

Study (The Parks Agency, 2007)	includes an assessment of the views into and out of the site and their designed or opportunist nature. The document notes that if the character and appearance of Knightshayes is to be preserved, it is necessary, as far as reasonable, for the setting to be protected from intrusive development, and that the effect on any development on the setting should be a material consideration in the planning process.
Historic environment – sustainability conclusions The planning system should set out a positive strategy for the conservation and protection of the historic environment, considering the value it plays in delivering sustainable, distinctive places that are enjoyed by local people. A balance needs to be struck where the priorities of maintaining and enhancing the built environment are balanced against the district's development needs. The impact on heritage assets of development should be proportionally considered in relation to their significance, with the most important nationally significant assets being given the utmost protection.	

Housing	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Laying the Foundations: A Housing Strategy for England (HM Government, 2011)	The document sets the strategy for getting the housing market moving. Priorities include increasing the supply of housing, by supporting locally planned large scale development; planning reforms to give communities more control over development, including through the Community Right to Build; stronger support for custom home building (self build); need to deliver more new affordable housing, both for rent and affordable home ownership; homes need to be well-designed, of the highest quality and environmentally sustainable; delivery of Zero Carbon Homes from 2016; new housing developments need to make suitable provision for ageing populations in the long-term, ensuring a mix of property types, including Lifetime Homes.
National Planning Policy Framework (DCLG, 2012)	The supply of housing should be significantly boosted. In order to deliver a wide choice of high quality homes, local authorities should widen opportunities for home ownership, by planning for a mix of housing basing for different groups of the community; identify the size, type, tenure and range of housing required in a location and reflecting local demand; provide affordable housing where it is needed. Housing should be located where it accords with sustainable development, and new homes within the countryside should be avoided unless there are special circumstances.
Planning Practice Guidance – Housing and Economic development needs assessment (DCLG, March 2014	Guides councils in how to assess their housing and economic development needs.

Planning policy for traveller sites (DCLG, 2012)	There should be fair and equal treatment for travellers, in a way that facilitates the traditional and nomadic way of life of travellers while respecting the interests of the settled community. Local planning authorities should work collaboratively to develop fair and effective strategies to meet need through the identification of land for sites, planning over a reasonable timescale. In doing so, the Green Belt should be protected, and plan-making should aim to reduce the number of unauthorised developments. New policies should be fair, realistic and inclusive, and should increase the number of traveller sites in appropriate locations, reducing tensions between settled and traveller communities and enabling provision of suitable accommodation from which travellers can access education, health, welfare and employment infrastructure whilst having due regard to the protection of local amenity and the environment.
Code for Sustainable Homes (DCLG, 2010)	The code sets nine categories of sustainable design against which new dwellings can be assessed to consider their environmental sustainability. The code sets minimum standards, which are in excess of building regulations, ranging from levels 1 to 6 (6 being the highest) against a range of criteria including energy and CO_2 emissions, water, materials, surface water run-off, waste, pollution, health and well-being, management, and ecology.
Housing Standards Review	As a result of the Housing Standards Review many of the requirements of the Code for Sustainable Homes will be consolidated into Building Regulations. This will require substantial changes to the content of the current Code, as well as a reconsideration of its role. In the light of this, the Government thinks that the current Code will need to be wound down to coincide with the changes incorporating the new standards coming into force. The Government will make further announcements in due course on the winding down, the transitional arrangements, and the handling of legacy developments, existing consents and affordable housing commitments being built out to current Code requirements.
The Way We Live Now (RIBA, 2012)	Consumers in the 21st century have particular requirements within modern housing that have not always been met by housing developments in recent decades. These requirements include larger windows for natural light and higher ceilings; large main living areas for eating and socialising; layouts which take into account technology used within the home; space for private time away from other members of the household; private outside space, particularly for families, or access to green public space in urban locations; long-term and short-term storage for functional items; dedicated space for domestic utility tasks, including washing, drying and ironing clothes, as well as storing vacuum cleaners, rubbish bins and recycling; and, options for different layouts.
Devon Sustainable Community Strategy 2008-18	The shortage of affordable housing is a significant issue as average house prices are nearly 10 times average earnings in Devon. Demand for affordable housing has increased. The county will need to deliver good quality, affordable housing, with sufficient development to respond to projected growth, and include provision for the homeless and vulnerable people.
Commissioning Strategy for Extra Care Housing (Devon County Council, 2010)	Increasing numbers of people are living longer, but with more complex conditions such as dementia and chronic illnesses. By 2022 20% of the English population will be over 65, and this figure is predicted to be even higher in Devon. The provision of Extra Care Housing for older people is an important element in preventing older people from moving into residential care and increasing choice and independence. Devon intends to develop an extra care housing programme to promote the health and well being of older people who wish to live independently.

A Community Housing Strategy for Mid Devon 2010-2015	Mid Devon's housing vision is to provide good quality housing both in terms of the condition and surroundings of existing stock and the supply of new housing. Large housing waiting lists indicate the existence of a problem with the availability of affordable housing, both in the social rental sector and home owner sector. Provision of rural affordable housing is also a priority, though local opposition to such development can be an issue, though good consultation has helped the process. The plan contains an objective of locating a suitable site in Tiverton for an extra care facility.
Exeter Strategic Housing Market Assessment, (DCA, 2014)	
Mid Devon Corporate Plan 2012-2015	'Better Homes' is a priority for the corporate plan. High rates of inward migration from other parts of the country have led to house price inflation, with prices now far outstripping local average wages. This situation is even further felt within the rural parts of the district. An ageing population also needs support to live in their own homes and suitably adapted accommodation. The district needs to ensure that there is sufficient decent housing for local residents and key workers who cannot afford to pay market prices.
Mid Devon Sustainable Community Strategy 2010-15	High inward migration has led to house price inflation, where prices have more than doubled in the last ten years, making them unaffordable for many in the district. There needs to be sufficient decent affordable housing for local residents and key workers. Also, people need to be able to remain in their homes longer as they get older.

Housing – sustainability conclusions

Nationally the country has not been building enough homes to house its population, and therefore significantly boosting the supply of homes is a priority. The proportion of the population of people above retirement age has increased and there is a need to provide appropriate housing in response. Providing for an ageing population or people with disabilities may need to be addressed through the delivery of homes that can be adapted as peoples circumstances change, or through the delivery of extra care housing. Wide variety of home types should be provided, across a range of tenures to meet the needs of the population. In response to the fact that house prices are nearly ten times local earnings, there is a need to provide affordable housing to address long social housing waiting lists. Such issues are also acutely felt in some of the more rural locations of the district, where house prices may be even higher, and will need to be addressed through affordable housing delivery to meet an identified need. Provision for the needs of gypsies and travellers should be made planned for which seeks to balance their locational, economic and social needs with the protection of amenity and the environment. There is a need for modern homes to be environmentally sustainable, and meets the consumer demands of the population, including provision of sufficient storage space and private outdoor space.

Infrastructure

Plans/programmes/ strategies reviewed	Key messages for Local Plan and SA
National Infrastructure Plan 2013 (HM Treasury & Infrastructure UK)	The government recognises that meeting the UK's infrastructure ambitions requires a long-term sustainable plan, which means taking a cross-cutting and strategic approach to infrastructure planning, funding, financing and delivery. That is why it published the first ever National Infrastructure Plan (NIP) in 2010, with subsequent updates in 2011 and 2012, which enabled it to take a holistic view of the challenges facing UK infrastructure and its approach to meeting them. The National Infrastructure Plan 2013 takes this further and sets out the government's plan for the next decade and beyond. For the first time brings together analysis of the UK's infrastructure needs across different sectors now and in the future, articulates the government's approach, sector by sector, to identifying and delivering the infrastructure that is needed, top 40 priority investments and is published alongside a robust forward-looking infrastructure pipeline.
Gas Generation Strategy (DECC, 2012)	Gas in an integral part of the UK's generation mix and is a reliable, flexible source of electricity. The government expects that gas will continue to play a major role in our electricity mix over the coming decades, alongside low-carbon technologies as we decarbonise our electricity system. Measures outlined in the plan are designed to ensure that: adequate gas generation capacity is available, including ensuring we maintain an appropriate capacity margin to maintain security of electricity supply; flexible plant is available to meet the intermittency associated with renewables and that the necessary gas supply infrastructure is in place to support the role of gas in generation.
National Planning Policy Framework (DCLG, 2012)	Planning policies should recognise and seek to address potential barriers to investment including a lack of infrastructure, and should identify priority areas for infrastructure provision. Local authorities should work with neighbouring and transport authorities to develop strategies for the provision of viable infrastructure necessary to support sustainable development, including large scale facilities such as rail freight interchanges, roadside facilities, and other major generators of travel demand. The provision of advanced, high quality communications infrastructure is essential for sustainable economic growth, and local plans should support the expansion of electronic communications networks. To meet the needs of local communities, planning policies should plan positively for community facilities such as local shops, meeting places, sports venues, cultural buildings, public houses and places of workshop. Policies should also take a positive, proactive approach to ensuring there is a sufficient choice of school places available to meet the needs of existing and new communities.
Mid Devon Infrastructure Plan (2014)	Mid Devon has prepared a new Local Plan for the district, which will cover the period 2013-33. The purpose of Infrastructure Plan is to identify what further infrastructure requirements are required over the 20 year period of the plan. The document sets out what infrastructure improvements will be needed to support the additional development set out in the plan, the timescale for when these will be needed, and who will provide them. It also sets out the level of resources needed to deliver the improvements, and how much will be sought from development. Ensuring development is supported by adequate infrastructure is fundamental to delivering the vision as set out in the new Local Plan.

Infrastructure – sustainability conclusions
The reviewed plans and strategies highlight the importance of delivering infrastructure to meet the needs of existing and new communities. The Government places great importance on the delivery of the following infrastructure as part of ensuring sustainable economic development: transportation, flood protection, communications, research, energy and waste. Community facilities and schools are important infrastructural elements that are required to meet the needs of local communities as part of the delivery of sustainable development.

Land (including agricultural land, brownfield land and contaminated land)	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Safeguarding Our Soils: A Strategy for England (DEFRA, 2009)	Soil is a fundamental and essentially non-renewable natural resource, providing an essential link between the components that make up our environment. Soils vary hugely from region to region and even from field to field. Soils perform valuable functions including nutrient cycling, water regulation, carbon storage, support for biodiversity and wildlife, and providing a platform for food and fibre production and infrastructure. Soils have been degraded by human actions, and are vulnerable to erosion, compaction and loss of organic matter; such changes are likely to be exacerbated by climate change. By 2030 all England's soils will be managed sustainably and degradation threats tackled successfully. Planning decisions must take sufficient account of soil quality, particularly when significant areas of the best and most versatile agricultural land are involved. The document also considers the need for local authority officers to make proportionate and robust decisions regarding the remediation of contaminated land. Sustainable remediation that does not involve the wholesale removal and replacement of soil should be encouraged.
National Planning Policy Framework (DCLG, 2012)	The planning system should contribute and enhance the natural environment by protecting and enhancing soils. It should prevent new and existing development from contributing to or being put at unacceptable risk from, or being adversely affected by unacceptable levels of soil pollution or land instability. The planning system should, where appropriate, seek the remediation and mitigation of despoiled, degraded, derelict, contaminated and unstable land. Plans should allocate land with the least environmental or amenity value. The re-use of land that has been previously developed (brownfield) should be encouraged (provided it is not of high environmental value). The development of lower quality land should be prioritised over the best and most versatile agricultural land. Local authorities can set their own approach to determining housing densities to reflect local circumstances.
Code for Sustainable Homes (DCLG, 2010)	Category 9 (ecology) of the code aims to promote development on land that already has a limited value to wildlife and discourages the development of ecologically valuable sites. An additional aim is to promote the most efficient use of a building's footprint by ensuring that land and material use is optimised across the development.

Housing Standards Review	Government considered a range of issues in the Housing Standards Review consultation. The Government subsequently considered a Technical consultation for a Nationally described Space Standard. These standards are reflected in the Local Plan under DM13 Housing sizes.
Land – sustainability conclusions Soil is a fundamental natural resource that has been degraded by human action. Soils should be protected and enhanced. Planning should consider allocating or developing land with the least environmental value, prioritising lower quality land. Consideration of the soil quality of best and most versatile agricultural land, and the need to remediate contaminated land should be a planning consideration. When considering development, the use of land should be optimised across a site to ensure the efficient use of building footprints whilst setting a density of development appropriate to local circumstances.	

Landscape	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Countryside and Rights of Way Act 2000	Places a duty on relevant authorities in exercising their functions, to have regard to the effect on land in an AONB, and to have regard to the purpose of conserving and enhancing the natural beauty of the AONB.
National Character Areas (Natural England)	National Character Areas (NCAs) divide England into 159 distinct natural areas. Each is defined by a unique combination of landscape, biodiversity, geodiversity and cultural and economic activity. Their boundaries follow natural lines in the landscape rather than administrative boundaries, making them a good decision making framework for the natural environment.
National Planning Policy Framework (DCLG, 2012)	The planning system should contribute to and enhance the natural environment by protecting and enhancing valued landscapes. Great weight should be given to conserving landscape and scenic beauty of National Parks and Areas of Outstanding Natural Beauty, and planning permission for major development in these designated areas should be refused except in exceptional circumstances.
Devon Landscape Policy Group Advice Note No. 2: Guidance on the siting, design and assessment of wind and solar PV developments in	Devon is faced with a wide range of challenges arising from a changing climate. Balancing the need to support the transition to a low carbon future and the need for energy security with the management of Devon's unique and valued landscape is one of these challenges. The landscape is also a major contributor to a strong tourism industry. The conservation of special landscape character is a core principle of the NPPF. However, Devon also has good conditions to produce wind and solar electricity, but it is important that the characteristics of Devon's landscape are not unacceptably harmed by poor design or inappropriate siting of renewable or low carbon technologies.

Devon (June, 2013)	
Dartmoor National Park Authority Core Strategy (2008)	Purposes of the park are to conserve and enhance the natural beauty of the National Park, and to promote opportunities for the understanding and enjoyment of its special qualities. The core strategy sets a vision for the park, highlighting the distinctive characteristics and special qualities of Dartmoor and points to the role of planning in sustaining those qualities.
Blackdown Hills AONB Management Plan 2014-19	The Management Plan sets out the policy framework for the conservation and enhancement of the Blackdown Hills AONB for the next five years. It describes the special qualities of the area and why the AONB is important, sets out an agreed vision for its future, identifies the challenges and opportunities for the area, and how these will be tackled. The Management Plan sets out the objectives and policies for managing the AONB that will work towards achieving the longer term vision. There are three main themes divided into several topics; Landscape - topics related to the primary purpose of conserving and enhancing natural beauty, Sustainable Development – topics related to the secondary purposes of recognising the economic and social needs of the local community, promoting sustainability and recreation and finally Communication and Management – the core functions of AONB management.
Landscape – sustainability conclusions Devon has a unique and valued landscape, which also contributes towards the tourism attraction of the county. Mid Devon has borders that are adjacent or in close proximity to two national parks, whilst the Blackdown Hills Area of Outstanding Natural Beauty crosses the east part of the district. Planning policies should offer protect valued landscapes, offering protection and enhancement of the most valued landscapes such as national parks and AONBs. The protection of the landscape needs to be balanced against the challenge of mitigating the effects of climate change through the transition to a low carbon future, particularly achieved through the development of renewables technologies, which are often located in rural areas.	

Minerals	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
National Planning Policy Framework (DCLG, 2012)	Minerals are essential to support sustainable economic growth and our quality of life. It is therefore important that there is a sufficient supply of material to provide the infrastructure, buildings, energy and goods that the country needs. However, minerals represent a finite resource, and it is important to make best use of them to secure their long-term conservation.
Planning Practice Guidance – Minerals (DCLG, March 2014)	Guidance on the planning for mineral extraction in plan making and the application process.
Code for Sustainable Homes (DCLG, 2010)	Category 3 of the code (materials) states that consideration of the environmental impact of materials can contribute to the development of sustainable homes. This part of the code aims to specify materials with lower environmental impacts over their life-

	cycle; to promote the specification of responsibly sourced materials for the basic building elements, as well as finishing elements.
Housing Standards Review	Government considered a range of issues in the Housing Standards Review consultation. The Government subsequently considered a Technical consultation for a Nationally described Space Standard. These standards are reflected in the Local Plan in DM13 Housing sizes.
Devon Minerals Plan 2011-2031 (Options Consultation, 2011)	Devon has minerals that are of national, and in some cases, international importance. The objectives of the document include: securing mineral development with minimal transportation by road while conserving environmental assets; making prudent use of existing resources; reinforce the distinctiveness of Devon's built environment through appropriate use of local sources of materials; safeguard mineral resources and associated infrastructure; manage mineral development in a manner that protect Devon's communities from adverse impacts and conserves the environment.
Minerals Local Plan (Devon County Council, 2004)	Objectives of the plan including: striking a balance between the demand for minerals and the need to protect the environment, having regard to sustainable development; to maintain a stock of reserves; to re-use waste minerals to reduce the requirement for new resources; to protect the County's earth science and nature conservation interest, historic environment, water environment and landscape character; to identify Mineral Working Areas; to consult with communities; and to prevent sterilisation of mineral resources by other development.
Minerals – sustainability conclusions There needs to be a sufficient supply of minerals to ensure the long-term ability to deliver infrastructure and development. The need for a supply of minerals needs to be balanced with the priority of protecting the environment. Planning for minerals extraction does not fall within the remit of Mid Devon District Council, being instead undertaken by Devon County Council. However, the consideration of the environmental impact of materials used in buildings and the desire to promote locally sourced materials is a district issue, as is the effect on local communities who are close proximity to mineral workings.	

Rural areas	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Rural Statement (DEFRA, 2012)	Rural areas are home to one-fifth of the English population, and 28% of England's businesses. The key priorities include wanting rural businesses to make a sustainable contribution to national growth; engaging directly with rural communities; wanting rural people to have fair access to public services and be actively engaged in shaping the places in which they live.
Rural Economy Growth Review (DEFRA, 2011)	Businesses in rural areas make a substantial contribution to the national economy, generating about 22% of employment. Between 2001 and 2009, the population of England's rural areas grew 10% faster than urban areas. There are strong interdependencies between market towns and their rural hinterlands. Smaller businesses play a relatively strong role in rural areas, accounting for

	over 50% of employment in rural areas, whilst home working rates are more than twice as high in rural than urban areas. Growth of rural businesses is restricted by broadband coverage, with 23% of rural household having no or slow connections. Populations of rural areas tend to be older than urban populations, and there are a substantially lower proportion of ethnic minority backgrounds.
Foresight. The Future of Food and Farming (Government Office for Science, 2011)	The global food system will experience an unprecedented confluence of pressures over the next 40 years. Population size will increase, raising demand, whilst competition for land, water and energy will intensify, while the effects of climate change will become increasingly apparent. Priorities for action include making sustainable food production central in development; working on the assumption there is little new land for agriculture; promoting sustainable intensification; including the environment in food system economics; reducing waste; anticipate major issues with water availability for food production and work to change consumption patterns.
National Planning Policy Framework (DCLG, 2012)	National planning policy encourages supporting economic growth in rural areas to create jobs and prosperity. This can be achieved through supporting sustainable business growth, development and diversification of agricultural activities, supporting rural tourism and retaining local services. The economic value of retaining the best and most versatile agricultural land should be considered.
Planning Practice Guidance – Rural Housing (DCLG, March 2014)	Guides councils in how to consider rural housing policies.
Mid Devon Sustainable Community Strategy 2010-15	In a rural district, access to vital services can be a significant problem. Communities in rural areas need access to facilities and services they need. Isolated small rural communities experience issues with transport and declining services. Broadband speeds needs to be increased in rural areas.
Rural areas – sustainability conclusions The population in rural areas has grown at a greater rate than urban areas in last decade. Rural businesses make a substantial contribution to the economy and should be supported to grow. Agriculture remains an industry that has faced many challenges in recent decades and such enterprises should be supported to diversify in order to benefit the rural economy. Rural areas experience social issues such as poor access to services and facilities, whilst the growth of their economies may be hampered by poorer broadband speeds.	

Transport	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Department for	DfT priorities include: continuing to develop the preparations for a high speed rail network; improving existing rail network and

Transport Priorities (gov.uk, 2014)	creating new capacity; tackling congestion on roads; continuing to improve road safety; encouraging sustainable local transport; promoting lower carbon transport, such as walking and cycling; supporting the development of the market for electric and other ultra-low emission vehicles; supporting the development of aviation; and maintaining high standards of safety and security for passengers and freight.
Door to Door: A strategy for improving sustainable transport integration (DfT, 2013)	The government wants more journeys to be made by public transport, cycling and walking. The vision is for an inclusive, integrated and innovative transport system where the use of sustainable transport is made more attractive for the entire door-to-door journey. Specific actions to achieve these goals include investing in high-quality cycling and walking environment, particularly close to train and bus stations; and ensuring the future needs of society are considered at the beginning of any new developments, so that interchange facilities can be designed around expected customer needs from the outset.
Creating Growth, Cutting Carbon: making sustainable local transport happen white paper (DfT, 2011)	The document sets a vision for a transport system that is an engine for economic growth, but is also greener and safer and improves quality of life. It notes that investment on its own is not enough, as people will need to make transport choices that are good for society as a whole. Two-thirds of all journeys are less than five miles – many of which could be easily walked, cycled or undertaken on public transport. Many drivers would be willing to drive less (particularly for shorter trips), if practical alternatives were available. The report highlighted key areas which needed to be addressed to encourage more people to use sustainable travel options including: making connections between different steps in the journey, and different modes of transport, easier; and providing better interchange facilities.
National Planning Policy Framework (DCLG, 2012)	Transport policies have an important role to play in facilitating sustainable development. The transport system needs to be balanced in favour of sustainable transport modes, giving people a choice about how they travel. Different approaches will be required within different communities. Developments that generate significant movement should be located where the need to travel is minimised and the use of sustainable modes of travel maximised. Developments should exploit opportunities for sustainable development and designed to: accommodate efficient delivery of goods; give priority to pedestrian and cycle movements and have access to high quality public transport facilities; create safe and secure layouts which minimise conflicts between different transport groups; incorporate facilities for charging low emission vehicles; and consider the needs of people with disabilities.
Local Transport Plan: Devon and Torbay Strategy 2011-2026	Devon and Torbay's transport system will offer business, communities and individuals safe and sustainable travel choices. The transport system will help to deliver a low carbon future, a successful economy and a prosperous, healthy population living in an attractive environment. Objectives include: deliver and support new development and economic growth; making best use of transport network and protect existing transport assets; work with communities to provide safe, sustainable and low carbon transport choices; strengthen and improve the public transport network; and make Devon the 'place to be naturally active'.
Code for Sustainable Homes (DCLG, 2010)	Category 1 of the code (energy and carbon dioxide emissions) can be delivered in part by the provision of cycle storage space within new dwellings. The code states that the wider use of bicycles as transport reduces the need for short car journeys and the

	associated CO_2 emissions.
Housing Standards Review	Government considered a range of issues in the Housing Standards Review consultation. The Government subsequently considered a Technical consultation for a Nationally described Space Standard. These standards are reflected in the Local Plan in DM13 Housing sizes.
Transport – sustainability conclusions Reducing carbon emissions produced as a result of transportation is a national priority. This can be achieved by increasing opportunities for the use of sustainable modes of transport, such as public transport, walking and cycling; through the delivery of opportunities to increase the use of electric vehicles and improving the connections between various modes of transportation. Improve the condition of local transport network, protecting existing transportation assets. Ensure safe and sustainable transport options are available to communities.	

Waste	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
Department for Communities and Local Government: Waste Priorities (gov.uk, 2014)	The main objective of government policy on waste is to protect human health and the environment by producing less waste and by using it as a resource where possible. Waste should be managed according to the 'waste hierarchy' of prevention, reuse, recycling and composting, and then using waste as a source of energy, with disposal (waste going to landfill) being a last resort. Objectives of government waste policy include: preparation of planning strategies by local authorities in which communities take more responsibility for their own waste; handling waste safely, without endangering human health and without harming the environment, and disposing of waste on one of the nearest appropriate places; assessing the suitability of waste sites, including the physical and environmental constraints on development and the cumulative effect of previous waste disposal facilities on the well-being of the local community.
Planning Policy Statement 10: Planning for Sustainable Waste Management (DCLG, 2011)	Key objectives for local authorities include: helping to deliver sustainable development through driving waste management up the waste hierarchy, addressing waste as a resource and looking to disposal as the last option, but one which must be catered for; providing a framework within which communities take more responsibility for their own waste; help implement the national waste strategy; help secure the recovery or disposal of waste without endangering human health and harming the environment; ensure the design and layout of new development supports sustainable waste management.
Updated national waste planning policy: Planning for	Alongside the intention to have a more streamlined policy approach on waste, National policy has been revised to reflect the Government's aspirations for waste management and changes made necessary due to the implementation of provisions in the Localism Act 2011. Changes include emphasising the need to increase the use of waste as a resource, placing greater emphasis on

sustainable waste management (Consultation, July 2013)	the prevention and recycling of waste, while protecting human health and the environment, as well as reflecting the principles of proximity and self-sufficiency. The policy stresses the importance of close co-operation between waste planning authorities, encourages the use of heat as an energy source where energy from waste development is being considered and removes the former reference in policy that waste planning authorities should give significant weight towards locational needs and wider environmental and economic benefits when considering waste planning applications in the Green Belt.
Waste Strategy for England (DEFRA, 2007)	Objectives of the strategy are to: decouple waste growth from economic growth and put more emphasis on prevention and re-use; meet and exceed landfill diversion targets; increase diversion from landfill of non-municipal waste and secure better integration of treatment for municipal and non-municipal waste; secure investment in infrastructure needed to divert waste from landfill; and get the most environmental benefit from that investment, through increased recycling of resources and recovery of energy from residual waste using a mix of technologies.
Code for Sustainable Homes (DCLG, 2010)	Category 5 of the code (waste) has the aim of providing adequate internal and external storage space for non-recycling waste and recyclable household waste. The code also aims to promote resource efficiency via the effective and appropriate management of construction site waste. Additional credits can be achieved by promoting the provision of compost facilities to reduce the amount of household waste sent to landfill.
Housing Standards Review	This consultation also includes changes to guidance contained in Approved Document H on external waste storage. The Government is committed to do all it can to tackle “bin blight” and the proposed changes will clarify the existing provisions and help to ensure external waste storage is properly considered in new housing development.
Devon Sustainable Community Strategy 2008-18	Waste production will need to be reduced so that resilience on landfill is decreased, whilst the need to process waste overall is reduced, whilst recycling of all types needs to increase.
Devon Waste Plan: Pre-submission (2013)	The Devon Waste Plan provides the policy framework for decisions by Devon County Council on planning applications for waste management development over the period to 2031. The Vision is supported by six Objectives that identify how sustainable waste management will be achieved, including targets for recycling and energy recovery and measures for the provision of waste management capacity, addressing climate change, supporting communities and businesses, conserving and enhancing Devon’s environment, and the transportation of waste.
Devon County Waste Local Plan (2006)	The objectives of the plan are: to promote encourage communities to take more responsibility for the waste they create; to minimise any adverse effects on human health and the environment caused by the introduction of waste management facilities, and to enhance the local environment when considering plans for site restoration, after-use and aftercare; to ensure than any proposal for a waste management facility is achieved in as sustainable a manner as possible; to ensure that the management of waste is undertaken in accordance with the ‘waste hierarchy’ of reduction, re-use, recycling and composting, energy recovery and disposal; to encourage the provision of waste management facilities at or close to major centres of population; to ensure Devon’s waste is treated or disposed of within the County; and to promote the establishment of an effective and integrated network of

	waste management facilities to serve national, regional, sub-regional and local needs.
Mid Devon Waste Strategy & Recycling Plan 2008 to 2013	Priority 1 is to reduce waste, particularly the amount of municipal waste going to landfill, increasing the 'dry' recycling rate, offering opportunities to participate in organic waste composting, and work with Devon County Council to secure provision of a Recycling Centre in the Culm Valley area.
Mid Devon Corporate Plan 2012-2015	A priority of the plan is to reduce the amount of waste going to landfill and increase recycling/composting.
Mid Devon Sustainable Community Strategy 2010-15	The district needs to reduce the amount of waste that goes to landfill.
Waste – sustainability conclusions National waste priorities are to protect human health and the environment whilst ensuring the delivery of sustainable waste management. Reducing the carbon footprint of waste will also contribute towards tackling climate change. New development should contribute to sustainable waste management, through the application of the waste hierarchy where disposal is the last resort, instead prioritising re-use, recycling or recovery.	

Water	
Plans/programmes/ strategies reviewed	**Key messages for Local Plan and SA**
European Water Framework Directive (European Commission, 2000)	The European Water Framework Directive (WFD) came into force in December 2000 and became part of UK law in December 2003. It provides an opportunity to plan and deliver a better water environment, focussing on ecology. It provides an opportunity to plan and deliver a better water environment through river basin management planning.
Flood and Water Management Act 2010	The act gives the Environment Agency a strategic overview of the management of flood and coastal erosion risk in England. It also requires upper tier authorities (locally this is Devon County Council) responsibility for preparing a strategy for managing flood risk from groundwater, surface water and other watercourses. The act places a duty on local authorities to aim to make a contribution towards the achievement of sustainable development when discharging flood management functions. The act introduces standards for the design, construction, maintenance and operation of new rainwater drainage systems, including sustainable drainage systems, and introduces an approving body (which is generally the local authority).
Water for people and the environment	The strategy sets out how the Environment Agency believes water resources should be managed to 2050 and beyond, to ensure that there will be enough water for people and the environment. The strategy sets out the EAs role to manage the water resources,

– Water Resources Strategy for England and Wales (Environment Agency, 2009)	and plan how to use them in a sustainable way. It notes that pressures on water resources are growing, given that more houses are being built, population is increasing and forecasts show we will use more water. The strategy sets out how the EA believes water resources should be managed to deliver a secure supply and safeguard the environment.
Water Resources Strategy Regional Action Plan for the South West (Environment Agency, 2009)	The action plan shows how the South West region will meet the challenges posed by pressures on water resources over the next 50 years. Actions include ensuring the water supply and demand is resilient to the effects of climate change, reducing carbon emissions associated with the supply of water, managing catchments better to protect water resources, enhancing biodiversity, reducing flood risk and improving the water efficiency of new housing and commercial developments.
National Planning Policy Framework (DCLG, 2012)	The NPPF requires local planning authorities to adopt proactive strategies to mitigate and adapt to climate change, taking full account of flood risk and water supply and demand considerations. New development should be planned to avoid increased vulnerability to the impacts arising from climate change. Local authorities should prevent new and existing development from contributing to or being put at unacceptable risk from water pollution. Local authorities should plan strategically and work with other authorities for the provision of infrastructure for water supply and flood risk. Development should be directed away from areas at highest risk of flooding. Land should be safeguarded that is required for current and future flood management. New development should reduce the causes and impacts of flooding, and should not increase flooding elsewhere.
Planning Practice Guidance – Water Supply, Waste Water and Water Quality (DCLG, March 2014)	Advises on how planning can ensure water quality and the delivery of adequate water and wastewater infrastructure.
Planning Practice Guidance – Flood Risk and Coastal Change (DCLG, March 2014)	Advises on how planning can take account of the risks associated with flooding and coastal change in plan-making and the application process.
South West River Basin Management Plan (Environment Agency, 2009)	The plan is prepared under the European Water Framework Directive, which requires all EU countries throughout the European Union to manage the water environment to consistent standards. Priorities for local government include ensuring that local planning document take into account the objectives of the SWRBMP, actions to reduce the physical impacts of urban development on artificial or heavily modified water bodies, promotion of the use of sustainable urban drainage systems and promote sustainable

	water management best practice through pre-application discussions with developers.
Code for Sustainable Homes (DLCG, 2010)	Category 2 (water) of the code is mandatory, and requires a reduction of potable water in the home from all sources, through the use of water efficient fittings, appliances and water recycling systems. Category 4 (surface water run-off) is mandatory and requires the design of surface water drainage for housing developments which avoid, reduce and delay the surcharge of rainfall run-off to watercourses and public sewers using sustainable drainage techniques. This protects receiving waters from pollution and minimises the risk of flooding.
Housing Standards Review	The Government propose to introduce a new, tighter level of water efficiency into the Building Regulations, to be set at 110 litres/person/day (lpd). This would be an optional higher level in addition to the current level of 125 lpd which could only be applied in areas with specific local needs (such as water stress). This would be chosen by the local authority. Government is considering the best way to define areas of water stress to ensure this works in practice.
A Warm Response - Our Climate Change Response (Devon County Council, 2005)	A strategic objective of the plan is to adapt to climate change by 'climate-proofing' for current and future weather hazards, in particular the impact of flooding. Consideration of actions required for the maintenance or adaptation of strategic infrastructure such as the built environment, transport network and utilities.
Devon Sustainable Community Strategy 2008-18	The county will need to incorporate necessary adaptations to mitigate the effects of climate change and flooding into new development.
Mid Devon Strategic Flood Risk Assessment (2014)	The Mid Devon SFRA update has considered all sources of flooding, including fluvial, pluvial, groundwater, canal, reservoir and sewer flooding, within the Mid Devon District. An assessment of the flood defences in the District has been undertaken, including defence condition and standard and the residual risk. Flood risk has been assessed on all sites highlighted within the draft Local Plan. Guidance for the requirements for a site specific Flood Risk Assessment for these sites is provided, as well as general guidance, throughout the SFRA, on flood risk assessment for any development proposals within the Mid Devon District. The updated Flood Map for Surface Water is provided, indicating the likelihood of surface water flooding in the Mid Devon District. Surface water flooding is a risk in many of the areas. Advice has been provided regarding suitable SuDS options. A broad scale assessment of Critical Drainage Areas has been undertaken.
Water – sustainability conclusions Managing flood risk and the effects of climate change is a key European, national and local priority, particularly as Mid Devon has suffered serious flooding in the past. There is also growing pressure on water resources and a need to improve resource efficiency. In particular new housing and commercial development should incorporate measures to improve water efficiency and reduce surface water run-off which can contribute to flooding. Water bodies should be protected from the effects of pollution, and there should be no reduction in their quality or status.	

This page is intentionally left blank

Appendix 2: Sustainability Appraisal of Policies and Sites

Strategic Policies

Policy S1: Sustainable development priorities

The Policy sets out the strategic priorities that will need to be achieved to deliver the vision and address key issues within Mid Devon to support sustainable communities.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This policy has a significant positive contribution towards this objective. It aims to conserve and enhance the natural environment and valued landscapes, including the Blackdown Hills AONB and National Parks on the periphery of the district. The policy aims to prevent unacceptable impact on the soil, air and water quality in the area and it also requires good design to conserve and enhance the natural environment and supports green infrastructure. The policy aspires to minimise impacts on biodiversity and geodiversity by recognising the wider benefits of ecosystems, delivering natural environment objectives, a net gain in biodiversity and by protecting International, European, National and local designated wildlife sites. It strengthens the existing policy which did not include a priority to conserve and enhance the natural environment or the objective to minimise the impact on biodiversity and geodiversity.	+3		+3
B) Protection and promotion of a quality built and historic environment	This policy has a significant positive contribution towards achieving this objective. The policy requires well designed development which reflects local surroundings and materials, creates safe and accessible environments and establishes a strong sense of place. The policy also aims to conserve and enhance the historic environment through the protection of both designated and non-designated heritage assets and assessing the	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	impact of new development on the historic character of Mid Devon's landscapes and townscapes. It strengthens the existing policy which did not include a priority to protect heritage assets or the historic character or Mid Devon.			
C) Mitigating the effects of climate change	This policy has a significant positive contribution towards achieving this objective. It aims to meet the challenge of climate change by supporting a low carbon future, energy efficiency, increase the use and supply of renewable and low carbon energy and conserving natural resources. The policy refers to managing flood risk and sustainable design. The option also promotes sustainable transport by reducing the need to travel by car and integrating sustainable travel such as walking and cycling, and aims to prevent unacceptable pollution levels in soil, noise, air and water. These priorities will have a secondary effect of minimising greenhouse gas emissions. This option builds on the existing policy by supporting a low carbon future and increasing the use and supply of renewable and low carbon energy.	+3	Other policies in the plan refer to the sequential approach to flood risk.	+3
D) Safeguarding and minimising resource use	This policy has a positive impact in contributing towards achieving this objective through supporting the effective use of land and aiming to prevent unacceptable levels of soil and water pollution as well as reducing pollution through good sustainable design. The policy enhances the existing adopted policy which does not prevent unacceptable pollution to soil or water. The option is silent on the management of waste however the option should be read in the context of other policies in the plan.	+2	Policy should be read alongside other polices within the plan.	+2
E) Promoting economic growth and employment	The policy will have a significant positive contribution on building a strong, competitive economy. It encourages access to education, training and jobs, infrastructure as well as the creation of new enterprise, economic regeneration and flexibility of use. The option aims to enhance and diversify the economy in general. The policy has a similar contribution to promoting the economic growth and employment of the area as the existing policy.	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
F) Supporting retail	This policy aims to ensure the vitality of town centres and will have a significant contribution towards achieving the objective to support retail. It suggests a hierarchy of centres, defined town centre shopping areas and a diverse retail offer at the three main towns (Tiverton, Crediton and Cullompton). The option supports a prosperous rural economy including through the retention and development of local services and community facilities in villages. This policy builds on the current adopted Local Plan policy which did not directly mention the importance of supporting the vitality of town centres.	+3		+3
G) Meeting housing needs	The policy promotes a delivery of a wide choice of high quality homes through a development focus at the three main towns as Mid Devon's most sustainable settlements where services and facilities are located. The option also refers to the long-term requirement for a new community at East of Cullompton and limited development in identified villages. In this case there may be a requirement for the provision of new services and facilities to meet the needs of the new housing development. The policy supports the housing needs of all sectors of the community including housing for the elderly and disabled, affordable housing and gypsy and traveller pitches, this enhances the existing policy. Overall the option is likely to have a significant positive impact on meeting housing needs.	+3		+3
H) Ensuring community health and wellbeing	The policy will have a significant positive impact in contributing towards this objective. It supports walking, cycling, public transport and the provision of social recreational, sport and cultural facilities and services. The policy enhances the existing policy as it aims to prevent unacceptable levels of pollution as a whole and highlights Crediton and Cullompton as areas where this is a particular local issue. Good sustainable design is required to create safe accessible environments. The policy also aims to create jobs and a wide choice of high quality homes while meeting the needs of all sectors of the community which helps to reduce poverty and	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	social exclusion.			
l) Delivering the necessary infrastructure	The policy overall will have a positive impact on this objective. The policy aims to build a strong completive economy through access to infrastructure. It promotes sustainable travel and supports the delivery of social, recreational, accessible green infrastructure, cultural services and facilities. The option enhances the existing policy as it supports the expansion of telecommunications and high speed broadband. Development focus at the main towns (Tiverton, Cullompton and Crediton) and the new community East of Cullompton contributes to making efficient use of existing infrastructure and is likely to reduce the overall need to travel.	+2	The option is silent on the specific provision of new transport infrastructure but the option should be read in the context of the Local Plan Review as a whole.	+2

Secondary/cumulative/synergistic effects:	This policy provides a strategic overview of sustainable development priorities in Mid Devon. It aims to meet the needs of the community and protect the natural and cultural environment. A number of issues are silent in the policy; these issues are however set out in detail by other policies in the plan which should be read as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The aims of the policy are over the lifetime of the plan. A number of impacts such as new housing development to meet the needs of the community will be permanent, whereas other effects of the policy will be dependent on market demand and may change over time, for example, economic development. The policy provides flexibility to respond to changing circumstances.
Spatial extent: (District wide / local)	The policy option aims to meet the needs across the district. Housing development is focussed at the three main towns (Tiverton, Cullompton and Crediton) with long term growth East of Cullompton.

Policy S2: Amount and Distribution of Development

Preferred Option: Amount of Residential Development

Meet Housing Need (7,200 dwellings)

The development needs of the community will be met through the provision of approximately 7,200 dwellings between 1 April 2013 and 31 March 2033.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	A housing target set at a level to meet the objectively assessed need of Mid Devon is capable of being met without negatively impacting on the existing environmental limits of the districts towns and villages. The SHLAA has identified a sufficient number of alternative sites to avoid adverse environmental impact. The level of impact on this objective will be dependent on individual proposals but is considered to be neutral in this scenario.	0	The policy should however be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes and designated biodiversity and geodiversity sites are conserved.	0
B) Protection and promotion of a quality built and historic environment	This approach will have some positive and some negative impacts in contributing to this objective depending on each individual proposal.	0	The policy should be considered in the context of other policies which aim to protect heritage assets and which promote high quality design which supports the positive contribution of new development to local character.	0
C) Mitigating the effects of climate change	The construction of new homes and catering for a greater population can increase carbon emissions; however there may be opportunities by meeting housing needs to enhance features such as walking and cycling provision for the community as a whole. Opportunities to reduce flood risk; promote low carbon or renewable energy and create low carbon buildings also arise. This option may have some positive and some negative impacts in contributing to this objective depending on each individual proposal.	0	The policy should be considered in the context of other policies such as sustainable design.	0
D) Safeguarding and minimising resource use	A housing target set at a level to meet the objectively assessed need of Mid Devon is capable of being met while still safeguarding and minimising resource use. The SHLAA has identified some alternative sites on brownfield land but will still require the loss of some of the highest grades of agricultural land if development is directed towards the towns. The level of	-2	This policy should be read in the context of other policies in the plan, for example sustainable design. A negative effect is anticipated post mitigation.	-2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	impact on this objective will be dependent on individual proposals but is considered to be negative in this scenario.			
E) Promoting economic growth and employment	An increase in residential development would benefit the local economy and increase the number of local people to the working pool. A positive impact	+1		+1
F) Supporting retail	This policy will have a positive contribution towards achieving this objective as an increase in population would increase the number of shoppers in the District and contribute towards enhancing shopping areas in Town Centres.	+1		+1
G) Meeting housing needs	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this policy is to meet the housing needs of the district set out in the SHMA 2014. The policy meets the objectively assessed housing needs target of 7,200 and promotes balanced communities by encouraging an appropriate mix of housing such as affordable housing, housing designed for the elderly and gypsy and traveller pitches.	+3	This option should however be read in the context of other policies in the plan which aim to meet the demand for services and facilities of the community.	+3
H) Ensuring community health and wellbeing	The policy helps to reduce barriers to housing by meeting the diverse housing needs of the district and is therefore likely to have at least a minor positive contribution to this objective. The option does not however proactively aim to meet the variety of indices in this option. The impact on the provision of open space, limiting air, noise and light pollution and promoting safe and secure environments is unknown.	+1	The option should however be read in the context of other policies which support community health and wellbeing.	+1
I) Delivering the necessary infrastructure	A housing target set at a level to meet the objectively assessed need of Mid Devon is capable of being met without negatively impacting on the delivery of necessary infrastructure. Transport evidence confirms a new junction onto the M5 at Cullompton is technically feasible and that infrastructure requirements can be met. This policy approach could have some positive or some negative impacts on delivering the necessary infrastructure. The level	0	The policy should read in the context of other policies which aim to deliver the necessary infrastructure. Any proposals will also have to abide to the infrastructure policy in the plan.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	of impact will be on a site by site basis.			

Secondary/cumulative/synergistic effects:	The impact of this policy option will be dependent on the scale and location of individual proposals. The Habitat Regulations Assessment of the Mid Devon Local Plan Review (Publication Draft version) concludes that the development proposed in the Local Plan Review alone will not result in adverse effects on the integrity of European Sites around Mid Devon. However uncertainties exist regarding the potential for the North Devon and Torridge Local Plan to have significant effects on the integrity of the Culm Grasslands SAC as a result of increased air pollution. Further work has been commissioned to determine this impact; the Habitat Regulations Assessment will be updated to reflect the latest evidence.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option aims to meet the housing needs across the district.

Alternative Option: Amount of residential development

Higher Growth Scenario (8,400 dwellings)

The development needs of the community will be met through the provision of approximately 8,400 dwellings between 1 April 2013 and 31 March 2033.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	A higher growth scenario is likely to be more difficult to distribute between the towns while avoiding environmental impacts. The towns of Tiverton and Crediton are both reaching their landscape limits as they are contained in natural topographical bowls. Current development is at or just below these thresholds and significant future development may exceed capacity under this scenario. In the case of Tiverton, only one	-2	The policy should however be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes and designated	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	strategic direction is available to the east and this option has landscape impact. The level of impact on this objective will be dependent on individual proposals but is considered to be negative in this scenario.		biodiversity and geodiversity sites are conserved. A minor negative effect is still anticipated post mitigation.	
B) Protection and promotion of a quality built and historic environment	A higher growth scenario will have some positive and some negative impacts in contributing to this objective depending on each individual proposal.	0	The policy should be considered in the context of other policies which aim to protect heritage assets and which promote high quality design which supports the positive contribution of new development to local character.	0
C) Mitigating the effects of climate change	The construction of new homes and catering for a greater population can increase carbon emissions; however there may be opportunities by meeting housing needs to enhance features such as walking and cycling provision for the community as a whole. Opportunities to reduce flood risk; promote low carbon or renewable energy and create low carbon buildings also arise. Similar to the existing policy this option may have some positive and some negative impacts in contributing to this objective depending on each individual proposal.	0	The policy should be considered in the context of other policies such as sustainable design.	0
D) Safeguarding and minimising resource use	A higher growth scenario is likely to be more difficult to distribute between the towns while safeguarding and minimising resource use. Option is likely to put greater pressure on the supply of brownfield sites and therefore require further greenfield developments. Similarly there are belts of the highest grades of agricultural land around the towns of Tiverton and Cullompton. The level of impact on this objective will be dependent on individual proposals. Given the additional land required to provide for the additional housing a significant negative effect is considered.	-3	This policy should be read in the context of other policies in the plan, for example sustainable design. A significant negative effect is anticipated post mitigation.	-3
E) Promoting economic	An increase in residential development would benefit the local economy and increase the number of local people to the working pool. A slight	+1		+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
growth and employment	positive impact.			
F) Supporting retail	This policy will have a positive contribution towards achieving this objective as an increase in population would increase the number of shoppers in the District and contribute towards enhancing shopping areas in Town Centres.	+1		+1
G) Meeting housing needs	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this policy is to meet the housing needs of the district set out in the SHMA 2014. The policy meets the housing needs target of 7,200 and exceeds it by setting a target of 8,400 dwellings. The additional 1,200 dwellings is not however considered significantly different to the preferred strategy to warrant a higher positive impact as both lower and high scenarios meet the objectively assessed need. The impact of this policy on existing services and facilities is unknown as this will be on a site by site basis. This approach is considered to have a positive impact on housing provision in the District.	+3	This option should however be read in the context of other policies in the plan which aim to meet the demand for services and facilities of the community.	+3
H) Ensuring community health and wellbeing	The policy helps to reduce barriers to housing by meeting the diverse housing needs of the district and is therefore likely to have at least a minor positive contribution to this objective. The option does not however proactively aim to meet the variety of indices in this option. The impact on the provision of open space, limiting air, noise and light pollution and promoting safe and secure environments is unknown.	+1	The option should however be read in the context of other policies which support community health and wellbeing.	+1
I) Delivering the necessary infrastructure	A higher growth scenario is likely to be more difficult to distribute between the towns while delivering the necessary infrastructure. In the case of Willand growth is limited, due to insufficient capacity of the existing motorway junction and the inability to fund a new junction with new strategic growth and motorway junction already committed at Cullompton. In the case of Cullompton further growth is limited due to market capacity, with existing commitments already exceeding the local housing need of Cullompton. The housing market is unlikely to be able to	-2	The policy should read in the context of other policies which aim to deliver the necessary infrastructure. Any proposals will also have to abide to the infrastructure policy in the plan. A negative effect is anticipated post mitigation.	-2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	support further growth in this location. This policy approach could have some positive or some negative impacts on delivering the necessary infrastructure. The level of impact on this objective will be dependent on individual proposals but is considered to be negative in this scenario.			

Secondary/cumulative/synergistic effects:	The impact of this policy option will be dependent on the scale and location of individual proposals.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option aims to meet the housing needs across the district.

Preferred Option: Amount of Commercial Development

Meeting commercial need scenario

The development needs of the community will be met through the provision of approximately 154,000 square metres of commercial floorspace between 1 April 2013 and 31 March 2033.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The commercial set to meet the objectively assessed need of the Mid Devon. The level of impact on this objective will be dependent on individual proposals but is considered to be slightly negative in this scenario.	-1	The policy should however be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes and designated biodiversity and geodiversity sites are conserved.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
B) Protection and promotion of a quality built and historic environment	This approach will have some positive and some negative impacts in contributing to this objective depending on each individual proposal.	0	The policy should be considered in the context of other policies which aim to protect heritage assets and which promote high quality design which supports the positive contribution of new development to local character.	0
C) Mitigating the effects of climate change	The construction of new commercial development can increase carbon emissions; however there may be opportunities by meeting commercial needs to enhance features such as walking and cycling provision for the community as a whole. A neutral impact. Development would increase surface water run-off, a negative impact. A number of commercial uses could be classed as 'less vulnerable' development and would therefore be compatible with flood zones 1, 2 and 3a. A negative impact. Opportunities to promote low carbon or renewable energy and create low carbon buildings arise. A positive impact. This option may have some positive and some negative impacts in contributing to this objective depending on each individual proposal. A slight negative impact overall.	-1	The policy should be considered in the context of other policies such as sustainable design and provide mitigation for surface water run-off.	0
D) Safeguarding and minimising resource use	A commercial target set at a level to meet the objectively assessed need of Mid Devon is capable of being met while still safeguarding and minimising resource use. The level of impact on this objective will be dependent on individual proposals but is considered to be negative in this scenario.	-1	This policy should be read in the context of other policies in the plan, for example sustainable design. A negative effect is anticipated post mitigation.	-1
E) Promoting economic growth and employment	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this policy is to meet the employment needs of the community. The policy option differs from the existing policy in the current plan, it reduces the amount of employment land proposed in line with up-to-date economic evidence which improves the viability of sites. It also increases flexibility in the type of employment	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	generating uses by introducing a wider range of use classes in comparison to the existing policy. It promotes uses that provide jobs which will help enhance and diversify the economy.			
F) Supporting retail	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this Policy is to meet the employment needs of the community which can include the provision of retail development. In providing the opportunity for retail development, this policy option will help enhance the vitality and viability of town centres and rural shopping. The Retail Study (2012) identifies a quantitative need of 14,580 sqm of comparison retail floorspace up to 2026. Long term forecasting of retail demand is not very reliable, so the anticipated need has been applied across the Plan period to 2033 on the understanding that allocated and non-allocated sites will come forward according to market demand and the plan will be reviewed before the need to 2026 is likely to be exhausted. As is noted above that forecasting retail demands is not very reliable, this flexible approach allows retail development to respond to market demand.	+3		+3
G) Meeting housing needs	This scenario does not contribute towards meeting the housing needs of Mid Devon	0		0
H) Ensuring community health and wellbeing	This scenario would have a positive impact as the option enhances the existing policy as it broadens the potential use classes which will be promoted by the policy, including development for healthcare, education and public facilities. As is noted above that forecasting retail demands is not very reliable, this flexible approach allows retail development to respond to market demand. The option supports development for community facilities and should help reduce social deprivation through the creation of jobs.	+2	The option should however be read in the context of other policies which support community health and wellbeing.	+2
I) Delivering the necessary	A housing target set at a level to meet the objectively assessed need of Mid Devon is capable of being met without negatively impacting on the	0	The policy should read in the context of other policies which aim to deliver	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
infrastructure	delivery of necessary infrastructure. Transport evidence confirms a new junction onto the M5 at Cullompton is technically feasible and that infrastructure requirements can be met. This policy approach could have some positive or some negative impacts on delivering the necessary infrastructure. The level of impact will be on a site by site basis.		the necessary infrastructure. Any proposals will also have to abide to the infrastructure policy in the plan.	

Secondary/cumulative/synergistic effects:	The impact of this policy option will be dependent on the scale and location of individual proposals.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option aims to meet the commercial needs across the district.

Alternative Option: Amount of commercial development

Higher Growth Scenario

The development needs of the community will be met through the provision of approximately 310,000 square metres of commercial floorspace between 1 April 2013 and 31 March 2033.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	A higher growth scenario is likely to be more difficult to distribute between the towns while avoiding environmental impacts. The towns of Tiverton and Crediton are both reaching their landscape limits as they are contained in natural topographical bowls. The level of impact on this objective will be dependent on individual proposals but is considered to	-2	The policy should however be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	be negative in this scenario.		and designated biodiversity and geodiversity sites are conserved. A minor negative effect is still anticipated post mitigation.	
B) Protection and promotion of a quality built and historic environment	A higher growth scenario will have some positive and some negative impacts in contributing to this objective depending on each individual proposal.	0	The policy should be considered in the context of other policies which aim to protect heritage assets and which promote high quality design which supports the positive contribution of new development to local character.	0
C) Mitigating the effects of climate change	The construction of new commercial development can increase carbon emissions; however there may be opportunities to enhance features such as walking and cycling provision. Given the amount of proposed commercial development, a negative impact. Developments may result in surface water run-off, a negative impact. Some types of commercial developments are classed as 'less vulnerable' where development can be compatible with flood zones 1, 2 and 3. Opportunities to reduce flood risk; promote low carbon or renewable energy and create low carbon buildings also arise. The levels of impact on this objective will be dependent on individual proposals but is considered to be negative in this scenario.	-3	The protection against flood risk, surface water run-off and provision of renewable energy policy is justified in policies elsewhere in the plan. Carbon emissions will be mitigated where possible, but the increase in traffic will still result in a slight negative impact.	-1
D) Safeguarding and minimising resource use	A higher growth scenario is likely to be more difficult to distribute between the towns while safeguarding and minimising resource use. Option is likely to put greater pressure on the supply of brownfield sites and therefore require further greenfield developments. Similarly there are belts of the highest grades of agricultural land around the towns of Tiverton and Cullompton. The level of impact on this objective will be dependent on individual proposals, but as there would need to be a large number of sites for the amount of commercial floorspace, the impact is considered significantly negative in this scenario.	-3	Policy should be read in conjunction with other policies within the plan and Devon County Council Waste Plan including those that set out the waste hierarchy. A negative impact is expected post mitigation.	-3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
E) Promoting economic growth and employment	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this policy is to exceed the employment needs of the community which could promote an increase in in-commuting to the District. The local economy would benefit from an increase in commercial development and may result in an increase in enterprise and start-up companies within the District.	+3		+3
F) Supporting retail	The key purpose of this Policy is to exceed the employment needs of the community which can include the provision of retail development. In providing the opportunity for retail development, this policy option will help enhance the vitality and viability of town centres and rural shopping and potentially encourage inward investment for redevelopments in the town centres. An over-provision of retail space in out of town areas could have a potential negative impact on town centres. Overall this scenario would have a positive impact.	+2		+2
G) Meeting housing needs	This scenario would not help to meet housing need.	0		0
H) Ensuring community health and wellbeing	This scenario would have a positive impact through the provision of sites for health centres and sportsc entres, but would have a negative impact as would not provide any open spaces for recreation etc. Overall a neutral impact is considered.	0	The option should however be read in the context of other policies which support community health and wellbeing.	0
I) Delivering the necessary infrastructure	A higher growth scenario is likely to be more difficult to distribute between the towns while delivering the necessary infrastructure. The necessary infrastructure for the amount of development proposed would need to be focused mainly around the two motorway junctions in the District as these would be the main strategic routes commuters and deliveries would arrive. A positive impact. Where commercial development is located in more rural areas of the district or locations further from the motorway, there may be reduced delivery of necessary infrastructure, a negative impact. Overall, a negative impact is considered.	-2	The policy should read in the context of other policies which aim to deliver the necessary infrastructure. Any proposals will also have to abide to the infrastructure policy in the plan. A negative effect is anticipated post mitigation.	-2

Secondary/cumulative/synergistic effects:	The impact of this policy option will be dependent on the scale and location of individual proposals.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	The scenario aims to exceed the need for commercial development across the District.

Preferred Option: Distribution of Development

New Community (Junction 28 Cullompton)

The policy concentrates development at Tiverton, Cullompton and Crediton and new community East of Cullompton to a scale and mix appropriate to their individual infrastructures, economies, characters and constraints. Other settlements will have more limited development which meets local needs and promotes vibrant rural communities.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This strategy focuses development at the main towns and a new community at East of Cullompton. A new community will however likely have a negative impact on landscape East of Cullompton as the scale of development is unlikely to be easily absorbed into the landscape setting, although mitigation measures through design, environmental enhancement and biodiversity off-setting can be expected to be able to minimise overall impact. There is a 1 ha unclassified wildlife site close to the western edge of the proposed urban extension. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is large and predominantly flat. The landscape of the surrounding area is also largely flat, offering limited views into the site. Although the site is	-2	The protection of the natural environment is justified in policies elsewhere in the plan. At East Cullompton the policy requires 'environmental protection and enhancement' which will help mitigate the impact on this objective however the level of development on the site will have an impact on the character of the area. CU9 sets out these measures in detail including the protection	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	largely flat offering limited views and fields are of a low wildlife value, the scale of the site is still considered to have negative effect to wildlife and biodiversity.		and strengthening of trees and other features, maintaining wildlife networks, providing public open space and allotments, strategic landscaping and green infrastructure including park land and open space. Overall a slight negative effect.	
B) Protection and promotion of a quality built and historic environment	New development in towns and villages may have the potential to impact on the historic environment located in and around these settlements. There may be some opportunities for enhancement of heritage assets and local distinctiveness, but this is likely to be on an individual site basis. A new community at East of Cullompton is unlikely to have an impact on the existing built environment as it will be further from the existing towns and villages. This site occupies a significant area within a landscape that has evidence of prehistoric and Roman activity recorded in the County Historic Environment Record. To the west, recent archaeological work has demonstrated the presence of prehistoric and Roman settlement in and around Cullompton. While no such sites are recorded within the area under consideration (though this may just reflect the absence of any formal archaeological work in this area) the Historic Environment Team would regard, due to the area of the proposed allocation and the known prehistoric and Roman activity in the wider landscape, that there is potential for the site to contain archaeological deposits. This would be in accordance with Local and National Policy on planning and the historic environment. There is the potential for minor negative impacts on heritage until more information is known.	-1/?	The protection of the historic environment is justified in policies elsewhere in the plan. At East Cullompton the policy requires a public masterplanning exercise to be undertaken before any planning application is made to ensure the quality of the final design of the development, which is considered to be a large positive impact. The adopted masterplan will help to minimise the impact on the built and historic environment through good design. CU7 seeks detailed archaeological investigation and measures to record and protect archaeological interest. Overall a neutral effect.	0/?
C) Mitigating the effects of climate change	By focusing new build development in the settlements where jobs and services are located the policy will reduce the need to travel and therefore reduce greenhouse gas emissions. There is potential for the provision of low carbon and renewable energy as part of a new community or as part	-3/?	The protection against flood risk, surface water run-off and provision of renewable energy policy is justified in policies elsewhere in	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	of larger development in and around the main towns or new community. Where some settlements are vulnerable to flood risk, new development would be subject to safeguards in policies, and levels of development will be dependent on the capacity of the settlement and available suitable land. There may be some opportunities for flood mitigation and promotion of low carbon and renewable energy measures, but this is likely to be on an individual site basis, for example through design. At East Cullompton approximately 10% of site in these zones, primarily through the centre of the site and in the north west and east of the site lies within Flood zones 2 and 3, a negative effect. Strategic flood risk assessment (2014) notes that the site is vulnerable to surface water flooding. Unnamed watercourses within sites can result in unknown impacts. The renewable energy, carbon reduction and air quality study (2014) supports the centralisation of development for carbon saving reasons. Taking into account flood risk and climate change an overall significant negative effect is considered given the scale of development.		the plan. At East Cullompton criteria within the policy seek mitigation measures through retention of land in the floodplain as informal amenity open space. The policy requires carbon reduction and air quality improvements and will help mitigate the effects of climate change. Taking into account flood risk and mitigation measures for climate change an overall neutral effect is considered, with an unknown impact due to unnamed watercourses.	
D) Safeguarding and minimising resource use	This policy scores positively towards safeguarding and minimising resource use as it directs some new development in the main towns and makes use of brownfield land to reduce the need for greenfield development. The provision of approximately 7,200 dwellings and 154,000 sqm commercial floorspace will contribute to waste levels. New development will add to waste water levels however the option considers environmental capacity. There may be some opportunities for resource-efficient design and/or construction following the principles of the waste hierarchy. At East Cullompton the development option is located largely on greenfield land although there are a number of farms within the site and approximately 8.4ha of contaminated land located in the western side of the site. Option would result in the loss of 63.2ha (west) of Grade 1 excellent quality agricultural land, 93ha (east) of grade 3 good to moderate quality agricultural land and 4.3ha (west) Grade 4 poor quality agricultural land, a significant negative effect. Grade 1 agricultural land in	-3	Policy should be read in conjunction with other policies within the plan and Devon County Council Waste Plan including those that set out the waste hierarchy. At East Cullompton although the remediation of contaminated land is a positive effect, the overall loss of Grade 1 agricultural land is still considered a significant negative effect.	-3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of a significant amount of Grade 1 agricultural land an overall significant negative effect is considered.			
E) Promoting economic growth and employment	The policy scores positively as it focuses some development in the existing towns and villages which increases jobs and reduces out commuting through the provision of commercial floorspace in these settlements. This policy diverges from the Core Strategy development strategy by directing future growth away from the main towns and towards a new community East of Cullompton. At East Cullompton there are a number of farms on which a small number of B class employment units are situated. These could be incorporated into the site, or replaced with other employment units as part of a mixed use approach for the whole site. The policy seeks the provision of 20,000 square metres of mixed commercial floor space during the plan period and 12,000 sqm post 2033, bringing with it a large number of jobs into the town. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. A new community has the potential to encourage larger investment and economic development. There would be a significant positive impact.	+3		+3
F) Supporting retail	Focusing development in the main towns and larger villages will support the vitality and viability of existing town centres and shopping facilities in the larger villages. The policy outlines a commercial target for 154,000 sqm. The definition of commercial development includes the retail use class. Given the uncertainty the policy has only a slight positive effect. A new community East of Cullompton provides the potential for encouraging larger investment and economic development. At East Cullompton the policy seeks the provision of 20,000 square metres of mixed commercial floor space including retail, during the plan period and 12,000 sqm post 2033, bringing with it a large number of jobs into the town. The scale of residential development in this location near to the town centre is considered a slight positive effect for town centre viability.	+1/?	At East Cullompton criteria in the policy state that this is subject to impact assessment which demonstrates no adverse impacts on existing retail uses within Cullompton Town Centre, an overall slight positive effect. An unknown is recorded until the retail impact has been assessed.	+1/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	As the percentage of retail within the sites commercial element is uncertain, an unknown is also recorded.			
G) Meeting housing needs	This policy diverges from the Core Strategy development strategy by directing future growth away from the main towns and towards a new community East of Cullompton. Policy provides for 7,200 dwellings across the district to meet the anticipated housing need target for the district, a significant positive effect. The SHMA 2014 confirms that this level of development will met the Districts objectively assessed need. The policy allows for a scale and mix of development to help contribute to balanced communities. Some housing is directed to the main towns where existing services and facilities are located. At East Cullompton, the development provides for 2,100 new dwellings during the plan period and 500 dwellings post 2033 of which 25% should be affordable a contribution towards future housing need, a significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. Policy seeks to provide for at least 5 gypsy and traveller sites, extra care housing and serviced plots for 5% self-build. Given the site is of such a scale to generate a critical mass of self-sustaining development and the option significantly contributes towards housing development an overall significant positive effect is considered.	+3	The percentage of affordable housing provision is justified in other policies within the plan.	+3
H) Ensuring community health and wellbeing	Development at the main towns will result in some new development having access to community facilities, open space and recreation within existing settlements. Development at Crediton and Cullompton may affect the designated air quality management areas resulting in a slight negative effect. There may be some opportunities for mitigation measures on a town wide basis, for example through new road layout / relief road and /or walking and cycling. Development in the main towns is located away from Exmoor National Park an international dark sky reserve, a positive effect. Walking, cycling and public transport are encouraged through proximity of some development at town centres and other key services, a	-3	Provision of community facilities, open space and recreation and air quality mitigation is justified in policies elsewhere in the plan. At East Cullompton, policy CU11 makes note of carbon reduction and air quality improvements which will help minimise pollution and benefit community health and wellbeing. CU9 makes provision for	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	further positive effect. The mix of development will contribute to reducing social exclusion. Policy supports limited development which meets local needs and promotes vibrant rural communities. At East Cullompton the site is located some distance from the town centre and remote from Cullompton town services/facilities. New services, facilities and walking, cycling and public transport links will need to be provided in a new community East of Cullompton. Option will contribute towards light and noise pollution, a slight negative effect. The western portion of the site is in very close proximity to the motorway, the noise from which may negatively impact on residential amenity. The Renewable Energy, Carbon Reduction and Air Quality study (2014) reiterates that North West Cullompton alongside East Cullompton are likely to result in the largest change in local air quality as both developments are large in size. Development in Cullompton will increase pollution concentrations as a result of additional traffic using the local road network; however the existing allocation for a Town Centre relief road linking Station Road and Meadow Lane is particularly important for air quality. In balancing the distance of the development from the town centre and the severance caused by the M5 motorway, the lack of services and the corresponding light, noise and air pollution an overall significant negative effect is considered.		areas of equipped and laid out public open space including children's play, sports pitches and allotments as well as strategic green infrastructure including park land, open space and local nature reserve. Criteria within the policy seek provision of a dedicated pedestrian and cycle route to the town centre. The policy also promotes the delivery of community facilities to meet local needs arising and transport provision to ensure appropriate accessibility for all modes. This suggests that opportunities for sustainable forms of travel may arise. An overall neutral effect.	
l) Delivering the necessary infrastructure	Policy contributes towards the efficient use of existing infrastructure by directing some growth to the main towns, reducing the need to travel, a positive effect. The policy option considers infrastructure capacity. At East Cullompton the policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements, for example, to M5 J28 before this site is developed. A development in this location and of the size proposed would have significant implications for the operation of J28 and the M5. The junction already operates at capacity at times with	-3	The provision of infrastructure is justified in policies elsewhere in the plan. At East Cullompton, policy CU13 includes an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. CU9 includes the provision of Green Infrastructure. CU8 sets out agreed transport	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	queues on the off-slips extending back onto the M5. This causes serious road safety concerns. The site is of a sufficient scale for infrastructure improvements to be necessary within and outside of the site. Given the capacity limitations for junction 28 of the M5; traffic implications for the Honiton Road and lead in time for delivery of a large urban extension against proposed mitigation measures a significant negative effect is considered until appropriate studies / modelling work can confirm that access can be achieved and suitable junctions designed. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places.		provision including; Provision of mitigation measures to ensure only acceptable impacts occur to J28 of the M5 as a result of traffic generated from the site; Provision of appropriate highway improvements on roads around the development to ensure any unacceptable traffic impacts are mitigated; Provision of a network of streets linking to the existing highway network, and appropriate mitigation to reduce impacts on the existing road network such as Honiton Road; Sustainable modes of transport are also supported. CU10 makes provision for a primary school and contributions towards secondary school places. The site is therefore likely to deliver the necessary infrastructure for the site which may also benefit the surrounding community.	

Secondary/cumulative/synergistic effects:	A number of mitigation measures are suggested which are covered by other policies in the plan. The Local Plan Review should be read as a whole and would mitigate the sustainability issues which cross-reference across the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option meets the housing and commercial needs for the district. Policy option enables some

	distribution of development across the district with a focus on a new community.

Alternative Option: Distribution of development

Town Focus

The development needs of the community will be met through the provision of approximately 7,200 dwellings and 154,000 square metres of commercial floorspace between 1 April 2013 and 31 March 2033. Option continues to concentrated development at Tiverton, Cullompton and Crediton, to a scale and mix appropriate to their individual infrastructures, economies, character and constraints. Rural Areas will have more limited development which meets local needs and promotes vibrant rural communities. This option differs from the preferred option which directs strategic growth towards East Cullompton in that major growth is distributed between the settlements. For the purposes of this assessment the SA assumes major development at Hartnoll Farm as the only suitable, available and achievable option at Tiverton.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The strategy continues to concentrate development at the districts main towns of Tiverton, Cullompton and Crediton. The policy acknowledges that development will be to a scale and mix appropriate to their individual infrastructures, economies, character and constraints. Development opportunities at Tiverton and Crediton are constrained by topography and the potential for landscape impact. This strategy accepts that a town centric approach would only be achievable with strategic growth at Hartnoll Farm as Tiverton's only suitable, available and achievable site. The Hartnoll Farm site is bordered by the Grand Western Canal Conservation Area to the south and east of the site. The canal is also a County Wildlife Site and Local Nature Reserve. Development of the site would have a potential significant visual impact and would impact on the biodiversity and habitats of the area. This strategy option accords with the aspirations of the NPPF to prevent isolated new homes and to protect and enhance valued landscapes. There may also be opportunities for enhancement of landscape character and biodiversity, but this is likely to be on an individual site basis. Given the potential landscape and environmental impact at Hartnoll Farm in particular as well as other larger	-2	The protection of the natural environment is justified in policies elsewhere in the plan. At Hartnoll Farm the policy requires environmental protection and enhancement which will help mitigate any negative impact on this objective by the development of this site. Land adjacent the Grand Western Canal will need to be protected as Green Infrastructure.	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	sites on the edge of the main towns an overall negative impact is considered.			
B) Protection and promotion of a quality built and historic environment	New development in towns and villages has the potential to have a negative impact on the historic environment located in and around these settlements. There may however be some opportunities for a positive effect through enhancement of heritage assets and local distinctiveness, but this is likely to be on an individual site basis. At Hartnoll Farm, the site lies in an area of archaeological potential with the HER recording prehistoric activity here and recent archaeological work has identified prehistoric activity across the wider landscape. A small part of the border is next to residential development and there are farm buildings within the site. The level of development proposed will be significant and therefore would likely impact the built and historic environment. However as there are no protected built or historic assets in or around the site the impact on this objective will be minor. In combination with the Tiverton Eastern Urban Extension (which is already allocated) development at Hartnoll Farm would represent a significant lengthening of Tiverton in an easterly direction along the valley floor. Two issues emerge; firstly as development extends ever easterly, the distance from town centre services increases as well as reliance on the private car and secondly the town will significantly close the gap between its urban areas with nearby villages such as Halberton, which currently has its own separate identity. The coalescence of Halberton is considered a negative effect that can't be mitigated.	-2/?	The protection of the historic environment is justified in policies elsewhere in the plan. At Hartnoll Farm, the proposal requires a public Masterplanning exercise to be undertaken before any planning application is made and which will improve the quality of the final design of the development. Archaeological investigation and appropriate mitigation to enhance sustainability. Coalescence of Tiverton with Halberton is not able to be mitigated satisfactorily, remaining a negative effect after mitigation.	-2/?
C) Mitigating the effects of climate change	By focusing new build development in the settlements where jobs and services are located the option will reduce the need to travel and therefore reduce greenhouse gas emissions. There is also potential for the provision of low carbon and renewable energy as part of larger development in and around the main towns. This option is considered to have a positive effect towards climate change mitigation. Where some settlements are vulnerable to flood risk, new development would be subject to safeguards in policies, with levels of development dependent	-1/?	The protection against flood risk, surface water run-off and provision of renewable energy policy is justified in policies elsewhere in the plan. The unknown impact of the unnamed watercourse in the site remains. At Hartnoll Farm the policy should be read in the	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	on the capacity of the settlement and available suitable land. There may be some opportunities for flood mitigation and promotion of low carbon and renewable energy measures, but this is likely to be on an individual site basis, for example through design. At Hartnoll Farm the entire site is in a low risk area (flood zone 1) being the area of least flood risk. There is an unnamed watercourse which has an unknown impact on flood risk. Evidence in the SFRA suggests that the site may have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir. Transport provision to ensure appropriate accessibility for all modes is also supported by the policy and traffic through Halberton and Sampford Peverell is discouraged. There are no existing services, infrastructure or facilities within the site or in close proximity. Given the scale of the development at this site it is likely some negative impacts will occur with regard to carbon emissions through construction and increased traffic movement.		context of other policies in the plan which aim to mitigate the effects of climate change and reduce the risk of flooding.	
D) Safeguarding and minimising resource use	Option scores positively towards safeguarding and minimising resource use as it focuses new development in the main towns and makes use of brownfield land to reduce the need for greenfield development. There could be some loss of the best and most versatile agricultural land around some settlements, a negative effect. The provision of approximately 7,200 dwellings and 154,000 sqm commercial floorspace will contribute to waste levels. New development will add to waste water levels however the option considers environmental capacity. At Hartnoll Farm, the majority of the site 68.7ha (71%) to the NE of the site is Grade 1 agricultural land. It is likely that this site will have a negative impact on this objective due to the scale of development of a site that is predominantly Grade 1 agricultural greenfield land which would be lost if this site is developed. The site will therefore have a significant negative impact on this objective.	-3	Policy should be read in conjunction with other policies within the plan and Devon County Council Waste Plan including those that set out the waste hierarchy.	-3
E) Promoting economic	This option takes forward the Core Strategy development strategy by directing development to the existing main towns of Mid Devon until	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
growth and employment	2033. This option will have a significant positive effect as it increases jobs and reduces out commuting by focusing commercial floorspace at existing main towns and settlements. The option also supports rural business by providing commercial floor space in villages. This option will help meet the employment needs of the district and enhance the economy in general while encouraging inward investment and future prosperity. The main towns have good connection to the strategic road network for storage and distribution uses. At Hartnoll Farm there are existing employment units on this site which could be retained. The policy option does not propose employment development on this site. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.			
F) Supporting retail	Focusing development in the main towns and larger villages will support the vitality and viability of existing town centres and shopping facilities in the larger villages. Although the option suggests retail provision could be provided this is not outlined as a policy requirement. At Hartnoll Farm, no retail is proposed however the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+2		+2
G) Meeting housing needs	This option takes forward the Core Strategy development strategy by directing development to the existing main towns of Mid Devon until 2033. The strategic option provides for approximately 7,200 dwellings across the district to meet the anticipated housing needs target for the district, a significant positive effect. Housing is concentrated at the main towns where existing services and facilities are located, a further positive effect. The policy option allows for a scale and mix of development to help contribute to balanced communities. At Hartnoll Farm the site allocation will provide for 1,100 dwellings which will include 25% affordable housing subject to further assessment of viability. The site therefore will have a significant positive impact on meeting housing needs for the district	+3	The percentage of affordable housing provision is justified in other policies within the plan.	+3
H) Ensuring	Focusing development at the main towns and villages will result in the	0	Provision of community facilities,	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
community health and wellbeing	majority of new development having access to community facilities, open space and recreation available within existing settlements, a positive effect. Option focuses development towards Crediton and Cullompton which are designated air quality management areas, a negative effect. There may be some opportunities for mitigation measures, on a town wide basis. For example through new road layout / relief road and /or walking and cycling. Development is focused away from Exmoor National Park an international dark sky reserve, a positive effect. Walking, cycling and public transport are encouraged through proximity of development to town centres and other key services, a further positive effect. The mix of development will contribute to reducing social exclusion. Policy option supports limited development which meets local needs and promotes vibrant rural communities. Option will contribute towards light and noise pollution, a slight negative effect. The policy does not mention the provision of open space, sport or recreation or the reduction of crime, a slight negative impact. Overall a neutral impact.		open space and recreation and air quality mitigation is justified in policies elsewhere in the plan. At Hartnoll Farm, the option promotes the delivery of community facilities to meet local needs arising and transport provision to ensure appropriate accessibility for all modes. An overall slight positive effect.	
I) Delivering the necessary infrastructure	Option contributes towards the efficient use of existing infrastructure by focusing growth in the main towns, reducing the need to travel. At Hartnoll Farm, the policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements before this site is developed. Initial work from the Tiverton Eastern Urban Extension suggest that one of the only viable solutions to transport concerns for further development to the East of Tiverton is a link road through the Blundells School site, This option is currently not considered viable. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Places are mostly needed at the Tiverton EUE,	-2	The provision of infrastructure is justified in policies elsewhere in the plan. At Hartnoll Farm, the policy for this site requires a public Masterplanning exercise to be undertaken before any planning application is made. The site is therefore likely to deliver the necessary infrastructure for the site with the potential to also benefit the surrounding community. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	which is the largest area of development by far. The masterplan for the area and forthcoming developments include the provision of a school site that can accommodate up to 420 pupils, which should be sufficient to meet the demand in Tiverton. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given pressures on education and highways capacity a negative effect is anticipated.		of, new or improved infrastructure and facilities.	

Secondary/cumulative/synergistic effects:	A number of mitigation measures are suggested which are covered by other policies in the plan. The Local Plan Review should be read as a whole and would mitigate the sustainability issues which cross-reference across the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option meets the housing and commercial needs for the district and the three main towns of Tiverton, Cullompton and Crediton. Policy option enables the distribution of development across the district to meet local needs.

Alternative Option: Distribution of development

New community (Junction 27 & Willand)

The development needs of the community will be met through the provision of approximately 7,200 dwellings and 154,000 square metres of commercial floorspace between 1 April 2013 and 31 March 2033. The policy concentrates development at Tiverton, Cullompton and Crediton and new community at Junction 27 / Willand to a scale and mix appropriate to their individual infrastructures, economies, characters and constraints. Other settlements will have more limited development which meets local needs and promotes vibrant rural communities.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This strategy focuses development at the main towns and a new community at J27 & Willand. Development at J27 / Willand of this scale would have a significant impact on existing landscape character, altering the rural quality of the entrance into Mid Devon from the M5 and the rural character around Willand and Sampford Peverell. Some parts of the site are more enclosed and shielded from wider views than others. Around Pitt Farm, there are undulating fields and a significant drop in ground level towards the motorway, with wide landscape views to the other side of the valley. Landscape sensitivity is higher, primarily because of the lack of a relationship with an existing settlement, and the change to landscape character that would arise as a result. There are views available into the site from the west, as far as the canal in Sampford Peverell, whereas some parts feel isolated, with reduced visibility – though some parts are visible from the motorway. There are differences in character/visibility between the north and south, the north being more open and plainly visible, the south less so. Given the scale of development and the impact on the landscape but differences in character and visibility, a significant negative effect is considered. The Phase 1 Habitat Survey (Devon Biodiversity Records Centre, June 2014) identifies a large number of species and protected species with the potential to be supported by this site, which include Bat species, Badger, Dormouse and Barn Owl. They also identify that the hedgerows, mature trees and woodland add to the structural diversity and wildlife potential of the site. It is noted that the site covers a large area which results in it featuring a variety of habitat types, including Biodiversity Action Plan Habitats. The Landscape and Visual Appraisal concludes: The site is bounded by major roads and partly by a cycle way, and is crossed by the A38, and wo lanes, one of which is a footpath and one a permissive path, which provide viewing opportunities. Much of the site north of the A38 is not suitable for development as a result of its high visibility and separation from the junction. Development may be more appropriate along either side of the A38 where the road	-3/?	The protection of the natural environment is justified in policies elsewhere in the plan. At J27 / Willand the policy requires environmental protection and enhancement including strategic green infrastructure which delivers multiple environmental benefits, this provides some mitigation. Furthermore Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review provide some mitigation. However given the scale of the development a negative impact on the landscape is likely to remain. An uncertain effect is still considered as the impact on the Culm Grasslands SAC remains unknown.	-2/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	corridor has been compromised by existing development. To the south of the A38, commercial development should not be permitted that would be visible from the M5, as the general perception from the motorway is that the area around the junction has not been developed. This would mean a corridor of undeveloped land as far as the first field boundary. To the south, residential development could be accommodated as far as Mount Stephen Farm utilising the pattern of hedges, trees and woodlands for a landscape structure and mitigation. However, further south than this the more open character would mean that development could be damaging, unless a substantial programme of hedge, tree and woodland planting could be implemented. The smaller area of land near to Muxbeare Lane with its more intricate pattern of hedges could be developed with little wider impact, although retention of hedges could compromise development. Employment development would potentially be more damaging than residential development owing to the larger scale buildings and infrastructure needed. In all cases, a corridor of undeveloped land should remain along the M5. Natural England has also expressed the potential for the proposed additional commercial and/or housing at J27 to impact on the Culm Grasslands SAC due to traffic impacting the air quality. Further information regarding traffic assessments and any consequential air quality assessment on the effects of this SAC will have to be undertaken to rule out any effect. Given the scale of development on balance a significant negative impact is considered. However uncertainty remains as the impact on the Culm Grasslands SAC is not yet known.			
B) Protection and promotion of a quality built and historic environment	New development in towns and villages may have the potential to impact on the historic environment located in and around these settlements. There may be some opportunities for enhancement of heritage assets and local distinctiveness, but this is likely to be on an individual site basis. The J27 / Willand site contains a listed building. Given the scale of development there could be a wider impact on Willand and Sampford	-2/?	The protection of the historic environment is justified in policies elsewhere in the plan. At J27 / Willand, the policy requires a public Masterplanning exercise to be undertaken before any planning	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Peverell built environments, including the setting of the Sampford Peverell Conservation Area. This site occupies a substantial area within a landscape that has evidence of prehistoric and Roman activity, overall a slight negative and uncertain effect.		application is made and which will improve the quality of the final design of the development. This site occupies a substantial area within a landscape that has evidence of prehistoric and Roman activity. Any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it. A neutral / uncertain effect would be considered.	
C) Mitigating the effects of climate change	By focusing new build development in the settlements where jobs and services are located the policy will reduce the need to travel and therefore reduce greenhouse gas emissions. There is potential for the provision of low carbon and renewable energy as part of a new community or as part of larger development in and around the main towns or new community. This policy is considered to have a positive effect towards climate change mitigation. Where some settlements are vulnerable to flood risk, new development would be subject to safeguards in policies, and levels of development will be dependent on the capacity of the settlement and available suitable land. There may be some opportunities for flood mitigation and promotion of low carbon and renewable energy measures, but this is likely to be on an individual site basis, for example through design. The J27 / Willand site contains a number of small streams and is in close proximity to the flood plain but is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to	-3/?	The protection against flood risk, surface water run-off and provision of renewable energy policy is justified in policies elsewhere in the plan. At J27 / Willand policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. A flood risk assessment will be required as even though the site is in flood zone 1 it is over 1ha in size and will	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	surface water run off without appropriate mitigation measures. Given the scale of development carbon emissions could be high. Overall a significant negative effect and uncertain effect is considered given the potential but unknown impact of the small streams, the potential contribution to surface water run-off and increased carbon emissions.		determine the impact of the small steams. The J27/ Willand policy also requires carbon reduction and air quality improvements, overall a neutral and uncertain effect is considered as the impact of the small streams remains unknown.	
D) Safeguarding and minimising resource use	This policy scores positively towards safeguarding and minimising resource use as it directs some new development in the main towns and makes use of brownfield land to reduce the need for greenfield development. The new community proposed is however likely to be entirely greenfield. There could be some loss of the best and most versatile agricultural land around some settlements, a negative effect. The provision of approximately 7,200 dwellings and 154,000 sqm commercial floorspace will contribute to waste levels. New development will add to waste water levels however the option considers environmental capacity. The J27 / Willand site is located on mainly greenfield land with a small portion on brownfield land. The majority of the site is Grade 3 good / moderate quality agricultural land with a small area to west Grade 4 poor quality agricultural land. Part of Junction 27 borders the Mineral Consultation Area for Hillhead Quarry. Development of the site may constrain future working of the remaining permitted reserves within Hillhead Quarry which extend up to the eastern boundary of Junction 27. The majority of the site is Grade 3 good / moderate quality land with a small section of the site to the west of the M5 grade 4 poor quality land. Given the scale of the development, the potential impact on Hillhead Quarry and the majority of the site on Grade 3 agricultural land a significant negative effect is considered. There is some uncertainty as there is potential that Hillhead Quarry is unviable to extract.	-3/?	Policy should be read in conjunction with other policies within the plan and Devon County Council Waste Plan including those that set out the waste hierarchy.	-3/?
E) Promoting economic	The policy scores positively as it focuses some development in the existing towns and villages which increases jobs and reduces out commuting	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
growth and employment	through the provision of commercial floorspace in these settlements. Policy supports rural business by providing commercial floor space in villages. This policy diverges from the Core Strategy development strategy by directing future growth away from the main towns and towards a new community at J27 / Willand. The J27 / Willand proposal provides 96 ha of commercial floorspace helping to diversify the economy and encourage inward investment, a significant positive effect. The policy notes development might comprise 25ha for B8 storage and distribution / logistics, 13ha outdoor leisure destination, 8 ha for designer retail outlet/village, 4.5ha Devon produce promotion centre, 3.4ha sports and activities centre including associated retail, 3ha plant / horticultural, 2.4ha cinema, 1.9ha motorway service area, parking and refuelling services, 1.8ha hotel, conference venue and concert hall and 0.8ha for regional visitor centre. Development in this location and at this scale has the potential to bring major inward investment and job creation for Mid Devon and the wider region. Development will need to recognise impacts could therefore be regional too.			
F) Supporting retail	Focusing development in the main towns and larger villages will support the vitality and viability of existing town centres and shopping facilities in the larger villages. The policy outlines a commercial target for 154,000 sqm. The definition of commercial development includes the retail use class. The J27 / Willand site will deliver 96ha of mixed commercial floorspace subject to an impact assessment which will need to demonstrate no adverse impact on town centre vitality and viability at a sub-regional level. The scale of commercial development proposed could significant enhance the retail offer of the district a significant positive effect however without a supporting retail impact assessment to determine the full implications a significant negative / unknown impact is recorded because of the potential to draw trade away from existing town centres.	-3/?	Development proposals for strategic retail development in this location would be required to be accompanied by a retail impact assessment demonstrating no harm to existing town retail centres.	-3/?
G) Meeting	This policy diverges from the Core Strategy development strategy by	+3	The percentage of affordable	+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
housing needs	directing future growth away from the main towns and towards a new community at J27 / Willand. Policy provides for 7,200 dwellings across the district to meet the anticipated housing need target for the district, a significant positive effect. The SHMA 2014 confirms that this level of development will meet the Districts objectively assessed need. The policy allows for a scale and mix of development to help contribute to balanced communities. Some housing is directed to the main towns where existing services and facilities are located. The new community would help meet the housing needs of the district however key services and facilities would need to be provided. J27 / Willand provides for 3,000 new dwellings a significant contribution towards future housing need of which 35% should be affordable, a significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.		housing provision is justified in other policies within the plan.	
H) Ensuring community health and wellbeing	Development at the main towns will result in some new development having access to community facilities, open space and recreation within existing settlements. Development at Crediton and Cullompton may affect the designated air quality management areas resulting in a slight negative effect. There may be some opportunities for mitigation measures on a town wide basis, for example through new road layout / relief road and /or walking and cycling. Development in the main towns is located away from Exmoor National Park an international dark sky reserve, a positive effect. Walking, cycling and public transport are encouraged through proximity of some development at town centres and other key services, a further positive effect. The mix of development will contribute to reducing social exclusion. J27 / Willand site is remote from existing services/facilities and the scale of the development would require a significant provision of new community service and facilities to provide for the community. The scale of development and proximity to Willand village may have a negative impact on this village community. There is also potential and this development may impact negatively on air quality.	-3	Provision of community facilities, open space and recreation and air quality mitigation is justified in policies elsewhere in the plan. The J27 / Willand policy seeks Carbon reduction and air quality improvements. A Masterplanning exercise will be undertaken before any planning application is made to ensure that essential services and facilities are delivered at the right time and in the right location. The policy also requires community facilities to meet local needs arising from housing development. The policy option includes leisure and community uses that could serve	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Given the need for a substantial level of new services and facilities and potential impact on air quality a significant negative impact is considered.		the wider local community which is a positive impact, however on balance given the concerns over the impact on Willand's village community a neutral effect overall is considered.	
l) Delivering the necessary infrastructure	Policy contributes towards the efficient use of existing infrastructure by directing some growth to the main towns, reducing the need to travel, a positive effect. At J27 / Willand there is limited capacity to support this development, on the assumption it is a relatively large development, a new primary school may be required given constraints on other schools in the area. Further assessment work is needed to identify the transport impact, sustainable transport options and strategic infrastructure requirements which could have a negative effect although this remains uncertain. Essential service infrastructure including; water supply, sewage works capacity, gas and electricity will need to be determined as deliverable. Overall a negative effect given the potential impact on transport and other essential service infrastructure.	-2/?	The provision of infrastructure is justified in policies elsewhere in the plan. At J27 / Willand the policy seeks community facilities to meet local needs arising from the housing development. The policy seeks appropriate transport provision to ensure appropriate accessibility for all modes, improvement to Junction 27 of the M5 motorway and provision of dedicated pedestrian and cycle route to the Tiverton Parkway railway Station. Development will also be expected to include environmental protection and enhancement including Strategic Green Infrastructure which delivers multiple environmental benefits. Development will be expected to be brought forward through a Masterplanning process and agreed phasing strategy to ensure infrastructure remains in step with overall viability of development,	+2/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			overall a positive effect although uncertain (as further assessments are required) is considered as the improvement to J27 will be a positive impact for both the new and existing community.	

Secondary/cumulative/synergistic effects:	A number of mitigation measures are suggested which are covered by other policies in the plan. The Local Plan Review should be read as a whole and would mitigate the sustainability issues which cross-reference across the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option meets the housing and commercial needs for the district. Policy option enables some distribution of development across the district with a focus on a new community.

Policy S3: Meeting Housing Needs

Policy S3 outlines the District's diverse housing needs including the provision of 7,200 dwellings between 1 April 2013 and 31 March 2033, thresholds for seeking affordable housing in Tiverton, Cullompton and Crediton and in rural localities, support for self-build sites including the provision for serviced plots on sites of 20 dwellings and the five year supply of gypsy and traveller pitches.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	Similar to the existing policy, the level of impact on this objective will be dependent on individual proposals.	0	The policy should however be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes and designated biodiversity and	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			geodiversity sites are conserved.	
B) Protection and promotion of a quality built and historic environment	Similar to the existing policy, this approach will have some positive and some negative impacts in contributing to this objective depending on each individual proposal.	0	The policy should be considered in the context of other policies which aim to protect heritage assets and which promote high quality design which supports the positive contribution of new development to local character.	0
C) Mitigating the effects of climate change	The construction of new homes and catering for a greater population can increase carbon emissions; however there may be opportunities by meeting housing needs to enhance features such as walking and cycling provision for the community as a whole. Opportunities to reduce flood risk; promote low carbon or renewable energy and create low carbon buildings also arise. Similar to the existing policy this option may have some positive and some negative impacts in contributing to this objective depending on each individual proposal.	0	The policy should be considered in the context of other policies such as sustainable design.	0
D) Safeguarding and minimising resource use	Similar to the existing policy this option may have some positive and some negative impacts on this objective dependent on each individual proposal.	0	This policy should be read in the context of other policies in the plan, for example sustainable design.	0
E) Promoting economic growth and employment	The policy approach does not proactively aim to promote economic growth and employment; however by meeting housing needs of Mid Devon it may encourage inward investment. Conversely meeting the housing needs of the community does not guarantee increased jobs or reduced out-commuting. This policy option takes a similar approach as the existing policy. The level of impact on this objective is unknown.	0		0
F) Supporting retail	The impact of this policy on this objective is unknown. The policy option does not proactively aim to support retail, however by meeting the diverse housing needs of Mid Devon could help support retail in local areas	0		0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	although this cannot be directly connected to be as a result of this option. This option takes a similar approach as the existing policy.			
G) Meeting housing needs	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this policy is to meet the housing needs of the district set out in the SHMA 2014. The policy meets the housing needs target of 7,200 and promotes balanced communities by encouraging an appropriate mix of housing such as affordable housing, housing designed for the elderly and gypsy and traveller pitches. The impact of this policy on existing services and facilities is unknown as this will be on a site by site basis. This policy enhances the existing policy in the Local Plan by updating the level of housing need for the district up to 2033 and strengthening the focus on the range of housing need. It also updates the target for affordable housing in line with recent viability assessment work. The policy supports self-build proposals outside settlements limits subject to policy DM6 Rural Exception sites and seeks to provide serviced plots for self-build on site of 20 dwellings or more. This approach is considered to have a positive impact on housing provision in the District.	+3	This option should however be read in the context of other policies in the plan which aim to meet the demand for services and facilities of the community.	+3
H) Ensuring community health and wellbeing	The policy helps to reduce barriers to housing by meeting the diverse housing needs of the district and is therefore likely to have at least a minor positive contribution to this objective. Similar to the existing policy the option does not however proactively aim to meet the variety of indices in this option. The impact on the provision of open space, limiting air, noise and light pollution and promoting safe and secure environments is unknown.	+1	The option should however be read in the context of other policies which support community health and wellbeing.	+1
I) Delivering the necessary infrastructure	This policy approach could have some positive or some negative impacts on delivering the necessary infrastructure. The level of impact will be on a site by site basis. This policy option takes a similar approach as the existing policy.	0	The policy should read in the context of other policies which aim to deliver the necessary infrastructure. Any proposals will also have to abide to the infrastructure policy in the plan.	0

Secondary/cumulative/synergistic effects:	The impact of this policy option will be dependent on the scale and location of individual proposals.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy option aims to meet the housing needs across the district.

Policy S4: Ensuring housing delivery

The policy sets out the mechanism that will allow further sites to come forward if for any reason the expected level of delivery falls significantly below the annual target set out in Policy S2. The Council will work proactively to bring forward allocations or outstanding consents. If this is insufficient identified contingency sites will be permitted.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The level of impact of this policy on the natural environment will be dependent on the site location and individual proposals for exception sites. The contingency site at Tidcombe Hall will require design and landscaping which reflects the setting of the Grand Western Canal.	0	The policy should be considered in the context of other policies which aim to protect the natural environment and ensure that the most valued landscapes and designated biodiversity and geodiversity sites are conserved.	0
B) Protection and promotion of a quality built	The impact of this policy on the quality of the built and historic environment is unknown as the level of impact will be dependent on the site location and individual proposals for exception sites. The contingency sites, land at Colebrook and Tidcombe Hall both will require archaeological	0	The policy should be considered in the context of other policies which aim to protect heritage assets and which promote high	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
and historic environment	investigation and appropriate mitigation.		quality design which supports the positive contribution of new development to local character.	
C) Mitigating the effects of climate change	The impact of this option on the potential to mitigate the effects of climate change is unknown as the level of impact will be dependent on individual proposals where exception sites are permitted..	0	The policy should be considered in the context of other policies such as sustainable design	0
D) Safeguarding and minimising resource use	The impact of this option on resources is unknown as the level of impact will be dependent on individual proposals where exception sites are permitted.	0	The policy should be considered in the context of other policies in the plan such as sustainable design and waste management.	0
E) Promoting economic growth and employment	The impact of this policy on this objective is unknown. The policy option does not proactively aim to promote economic growth and employment; however by providing a tool to ensure housing delivery is met by meeting the housing needs of Mid Devon it may encourage inward investment. Conversely meeting the housing needs of the community does not guarantee increased jobs or reduced out-commuting.	0		0
F) Supporting retail	The impact of this policy option on this objective is unknown. The policy option does not proactively aim to support retail; however by providing a tool to ensure housing delivery is met by meeting the housing needs of Mid Devon it could help support retail in local areas, although this cannot be directly connected to be as a result of this policy.	0		0
G) Meeting housing needs	This option will have a significant positive contribution towards achieving this objective by supporting 'Policy S3 Meeting Housing Needs'. The policy acts as a tool to ensure housing delivery to meet the target set out under Policy S3. This policy enhances the existing plan by providing a strategic policy to ensure housing delivery.	+3		+3
H) Ensuring community health and	This policy does not proactively aim to meet the variety of indices in this option, for example, its impact on the provision of open space, limiting air, noise and light pollution and promoting safe and secure environments is	+1		+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
wellbeing	unknown. However the option supports 'Policy S3 Meeting Housing Needs' to ensure housing delivery throughout the lifetime of the plan. By providing a tool to ensure housing delivery across the district, the provision of a wide range of housing as outlined in S3 will help reduce barriers to housing and is therefore likely to have at least a minor positive contribution to this objective.			
I) Delivering the necessary infrastructure	This policy does not proactively aim to deliver necessary infrastructure. The level of impact on the existing infrastructure is unknown as this will be dependent on site location and individual proposals. The contingency site, land at Colebrook will require the upgrading of Colebrook lnae and provision of two points of access along Siskin Chase. Tidcombe Hall will require a vehicular access point onto Canal Hill and improvements to Tidcombe Lane.	0	The policy option should read in the context of other policies which aim to deliver the necessary infrastructure.	0

Secondary/cumulative/synergistic effects:	The policy sets out the mechanism that will allow further sites to come forward if for any reason the expected level of delivery falls significantly below the annual target set out in Policy S3 or a 5 year supply of deliverable sites cannot be demonstrated. The Council will work proactively to bring forward allocations or outstanding consents. If this is insufficient identified contingency sites will be permitted. The plan identifies two contingency sites; Land at Colebrook, Cullompton and Tidcombe Hall, Tiverton. The secondary and cumulative impact of this policy will be dependent on the scale and location of individual proposals.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	Policy aims to ensure housing delivery across the district.

Policy S5: Public Open Space

Policy sets out standards for the provision of open space in the parishes of Tiverton, Cullompton and Crediton as well as those villages in policy S13, standards for all other areas and details of onsite/off site financial contributions. The Council will not use CIL to fund open space provision to avoid double charging.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	Policy has a positive effect, as the provision of public open space in new development can contribute to green infrastructure and the creation of wildlife corridors within built development. On-site open space can also be used to break up the built form of development and protection of valued landscapes.	+2		+2
B) Protection and promotion of a quality built and historic environment	Onsite open space will be provided by the developer and designed in such a way as to maximise the attractiveness, safety and overall quality of the development. Open space within new development can be strategically located to enhance the townscape and reinforce local distinctiveness, a positive effect.	+2		+2
C) Mitigating the effects of climate change	No impact.	0		0
D) Safeguarding and minimising resource use	No impact.	0		0
E) Promoting economic growth and employment	No impact.	0		0
F) Supporting retail	No impact.	0		0
G) Meeting housing needs	Policy has a slight negative effect by reducing housing density and increasing the costs of development, thereby reducing the overall supply of housing.	-1		-1
H) Ensuring community	The Policy is based on the Councils Open Space and Play Area Study (2014) to determine the level of supply across the district. Policy has a significant	+3	Existing public open spaces are protected from development by	+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
health and wellbeing	positive effect for communities by increasing the access to open space and recreation development either directly on-site or off site. Types of open space include allotments, amenity green space, parks, sport and recreation grounds, play space & youth space. Onsite open space will be provided by the developer and designed in such a way as to maximise the attractiveness, safety, and overall quality of development. A planning obligation will be used to control the long term maintenance of open space through a management company.		policies elsewhere in this plan, and communities may also seek to protect them by seeking their designation as local green spaces, registering them as Assets of Community Value or through protection in a Neighbourhood Plan.	
I) Delivering the necessary infrastructure	The provision of public open space in new development can contribute to green infrastructure provision, a positive effect.	+2		+2

Secondary/cumulative/synergistic effects:	The cumulative effect of planning obligations / CIL is considered through an assessment of Plan wide viability and is not considered overly burdensome to prevent most new housing development.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Public open space is not considered to have a permanent effect on the environment.
Spatial extent: (District wide / local)	Policy will contribute toward the open space needs for the district and will be concentrated where new development is delivered.

Policy S6: Employment

The policy sets out the employment needs of the community through the development of 154,000 square metres of commercial floorspace comprising a range of employment generating uses; Office, industry storage and distribution, retail, tourism and leisure, development for healthcare, education and public facilities and other forms of sustainable employment generating uses.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of	The level of impact of this Policy on the natural environment will be dependent on site location and individual proposals.	0	The policy should be considered in the context of other policies which	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
the natural environment			aim to protect the natural environment and ensure that the most valued landscapes and designated biodiversity and geodiversity sites are conserved.	
B) Protection and promotion of a quality built and historic environment	The level of impact of this option on the built and historic environment is unknown as this will be dependent on each individual proposal.	0	The option should be considered in the context of other policies which aim to protect heritage assets and which promote high quality design.	0
C) Mitigating the effects of climate change	The impact of this policy on this objective is unknown. Opportunities may arise to help mitigate the effects of climate change however this is dependent on each individual proposal.	0	The policy should be considered in the context of other policies such as sustainable design.	0
D) Safeguarding and minimising resource use	The impact of this policy on this objective is unknown. Opportunities may arise to help minimise resource use however this is dependent on each individual proposal.	0	The policy should be considered in the context of other policies such as sustainable design.	0
E) Promoting economic growth and employment	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this policy is to meet the employment needs of the community. The policy option differs from the existing policy in the current plan, it reduces the amount of employment land proposed in line with up-to-date economic evidence which improves the viability of sites. It also increases flexibility in the type of employment generating uses by introducing a wider range of use classes in comparison to the existing policy. It promotes uses that provide jobs which will help enhance and diversify the economy.	+3		+3
F) Supporting retail	This policy will have a significant positive contribution towards achieving this objective. The key purpose of this Policy is to meet the employment needs of the community which can include the provision of retail	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	development. In providing the opportunity for retail development, this policy option will help enhance the vitality and viability of town centres and rural shopping. The Retail Study (2012) identifies a quantitative need of 14,580 sqm of comparison retail floorspace up to 2026. Long term forecasting of retail demand is not very reliable, so the anticipated need has been applied across the Plan period to 2033 on the understanding that allocated and non-allocated sites will come forward according to market demand and the plan will be reviewed before the need to 2026 is likely to be exhausted. The policy differs from the existing policy by providing flexibility of uses to meet the overall commercial floorspace, whereas the existing policy set aside 10,000m2 to be met by retail floorspace. As it is noted in the supporting text that forecasting retail demand is not very reliable, this flexible approach allows retail development to respond to market demand.			
G) Meeting housing needs	This policy will have a minor positive contribution to meeting housing needs. The option does not proactively aim to meet housing needs such as the supply or mix of housing however by providing for commercial floor space across the district this could help improve access to local services and facilities for local communities. The option enhances the existing policy as it broadens the potential use classes which will be promoted by the policy, including development for healthcare, education and public facilities.	+1		+1
H) Ensuring community health and wellbeing	This policy will have a positive contribution to ensuring community health and wellbeing. The option strengthens the existing policy by encouraging healthcare, education and public facilities. The option supports development for community facilities and should help reduce social deprivation through the creation of jobs.	+2	The impact of the option on features such as open space, sustainable forms of travel and pollution are unknown but should be read in the context of the Local Plan Review as a whole	+2
I) Delivering the necessary	This policy approach could have some positive or some negative impacts on delivering the necessary infrastructure. The level of impact will be	0	The option should read in the context of other policies which aim	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
infrastructure	dependent on the site location and individual proposals. This option takes a similar approach as the existing.		to deliver the necessary infrastructure.	

Secondary/cumulative/synergistic effects:	The impact of this policy will be dependent on the scale and location of individual proposals.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the development will be permanent but the use class of the development may change over time depending on market demand.
Spatial extent: (District wide / local)	Policy option aims to meet the employment needs across the district.

Policy S7: Town Centres

The vitality and viability of the town centres of Tiverton, Cullompton and Crediton will be protected and enhanced by positive management so that economic regeneration and heritage conservation reinforce each other. This policy deviates from the Core Strategy by removing Bampton from settlements with town centres in line with its status as its new village categorisation.

Sustainability objective	Commentary	impact	Mitigation	Post Mitigation
A) Protection of the natural environment	No impact.	0		0
B) Protection and promotion of a quality built	Policy has a positive effect by protecting and enhancing the town centres of Tiverton, Cullompton and Crediton so that regeneration and heritage reinforce one another. Option supports town centre uses that are well	+2	The option should be considered in the context of other policies which aim to protect heritage assets and	+2

Sustainability objective	Commentary	impact	Mitigation	Post Mitigation
and historic environment	designed a further positive effect.		which promote high quality design.	
C) Mitigating the effects of climate change	Through a town centre focus, the option has a positive effect on walking, cycling and public transport.	+2		+2
D) Safeguarding and minimising resource use	The option has a positive effect, by encourages economic regeneration of town centre locations optimising the use of previously developed land and reducing the amount of derelict / underused land.	+2		+2
E) Promoting economic growth and employment	The central aim of the option is to protect and enhance the vitality and viability of the town centres of Tiverton, Crediton and Cullompton to support economic regeneration. Through enhancement and regeneration this policy will have a positive effect on economic growth and employment.	+2		+2
F) Supporting retail	The vitality and viability of the town centres of Tiverton, Crediton and Cullompton will be supported through this policy, a significant positive effect. The option deviates from the Core Strategy by removing Bampton's status and changing it to that of the larger villages, so that it will no-longer have a town centre boundary. The Retail Study suggests that a changing role or focus for town centres may be required, involving conversion and redevelopment to other uses. The policy therefore has a positive effect in supporting retail by promoting new houses, shops, leisure and offices as well as other key town centre uses in town centre locations or outside of town centres in sequentially preferable locations. The sequential test is set out in full elsewhere in the plan.	+3	The sequential test is set out in full elsewhere in the plan.	+3
G) Meeting housing needs	Town centre redevelopment is expected to include some residential accommodation, to improve the viability of development and the vitality of the town centre, a positive effect.	+2		+2
H) Ensuring community health and wellbeing	The policy directs town centre uses to sequentially preferable locations and improve opportunities for walking and cycling, a slight positive effect. The policy will also contribute towards measures to enhance and improve community uses, a further positive effect.	+1		+1

Sustainability objective	Commentary	impact	Mitigation	Post Mitigation
I) Delivering the necessary infrastructure	The policy option requires traffic management measures to improve the environment and accessibility, a positive effect.	+2		+2

Secondary/cumulative/synergistic effects:	The policy option should be considered alongside the retail sequential test. The Local Plan Review should be read as a whole
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect will be permanent.
Spatial extent: (District wide / local)	The policy applies district wide by focus new housing, retail development and other town centre uses into the districts three main town centres with proposals outside these locations considered through the Plans sequential test.

Policy S8: Infrastructure

The Council will work with providers and developers to ensure new development is served by the necessary infrastructure in a predictable, timely and effective fashion. The policy sets out key infrastructure and facilities required for new development in an infrastructure plan taking account of existing provision and cumulative impact and seeks financial contributions towards improved infrastructure from developers.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural	Infrastructure development can involve large man-made development such as roads which can negatively impact on the natural environment. The policy enhances the existing policy option as it promotes sustainable	-2	The policy should however be considered in the context of other policies which aim to protect the	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
environment	modes of transport, however overall the policy option does not set out significant mitigation measures to protect the natural environment.		natural environment and ensure that the most valued landscapes and designated biodiversity and geodiversity sites are conserved. A minor negative effect is considered to best represent the impact.	
B) Protection and promotion of a quality built and historic environment	Infrastructure development can involve large man-made development such as roads which can negatively impact on the built and historic environment such as listed buildings, conservation areas and archaeology. In some cases a negative impact of infrastructure on this objective cannot be completely mediated due to the nature of the development and the requirement for its location. Overall the option does not set out significant mitigation measures to protect the built and historic environment, however the nature of the type of development can help contribute to the improve safety in the built environment and cumulative impacts are considered in the option. Opportunities to enhance the built environment may also arise. The option therefore will have some positive and some negative impacts in contributing to this objective.	0	The option should be considered in the context of other policies in the plan which aim to protect heritage assets and which promote high quality design.	0
C) Mitigating the effects of climate change	The provision of infrastructure such as roads can encourage greater use of the car however the option enhances the existing policy by promoting the use of sustainable modes of transport which will help reduce carbon emissions. Although not set out explicitly, the option also enables the provision the infrastructure to reduce flood risk and promote low carbon or renewable energy. New development can also be guided to locations where its infrastructure will help to achieve wider planning objectives such as air quality improvements. Overall this policy option is likely to have a positive impact towards achieving this objective.	+2		+2
D) Safeguarding and minimising	The impact of this option on resources such as water quality and versatile agricultural land is unknown as this will be site specific. The option	0		0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
resource use	provides some opportunities to support this objective through enabling infrastructure, for example, to manage waste or protect water quality. The option also considers the cumulative impact of development. Similar to the existing policy, there is potential for this option to have both positive and negative impacts on this objective.			
E) Promoting economic growth and employment	This option enables the provision of new infrastructure where required. It states that new development will be served by necessary infrastructure in a predictable, timely and effective fashion; this in turn can help to serve the economic growth and employment of the district by providing good transport links and necessary infrastructure to attract economic development into the district. Similar to the existing policy the approach does not proactively aim to promote this objective however it is likely to have at least a minor positive impact in promoting economic growth and employment.	+1		+1
F) Supporting retail	This option enables the provision of new infrastructure where required. It states that new development will be served by necessary infrastructure in a predictable, timely and effective fashion; this in turn can help to serve the support retail in the district. The option is likely to have at least a minor positive impact in contributing towards achieving the objective. Similar to the existing policy, the option is not set out to support retail development and therefore the potential for enhancing the vitality and viability of the town centre or rural shopping is unknown.	+1		+1
G) Meeting housing needs	This policy does not directly add to the supply of housing, or affect the size and mix of housing and therefore won't significantly contribute to this objective. However the policy states that new infrastructure development will be guided by the need for community facilities and any existing shortages, the option will therefore help minimise pressure of existing and improve access to services and community facilities. Similar to the existing policy it will have at least a minor positive impact in achieving this objective.	+1		+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
H) Ensuring community health and wellbeing	The policy is guided by the need for community facilities and existing shortages. This option enhances the existing policy by promoting improvements to accessibility for the whole community and sustainable modes of transport. There is also the possibility that new development can be guided to locations where its infrastructure will help to achieve wide planning objectives such as air quality improvements. The impact of this option on some features of this objective such as pollution levels will be dependent on the development proposed. Overall this policy will have a positive impact on achieving this objective.	+2		+2
I) Delivering the necessary infrastructure	The key purpose of this option is to help deliver the necessary infrastructure in the district. It is guided by the need for community facilities and any existing shortages and therefore aims to minimise pressure on existing infrastructure. By not categorising types of infrastructure, the policy option ensures that a flexible approach is taken to deliver the wide range of infrastructure required, for example, roads, green infrastructure and telecommunications.	+3		+3

Secondary/cumulative/synergistic effects:	The policy option takes into account the cumulative impact of new development and enables infrastructure development to meet the needs of existing and future communities.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the Plan up to 2033. Once completed the effect can be permanent, for example, the creation of a new road. Provision for other development such as schools may change over time. In the short term, particularly for large scale infrastructure development carbon emissions could be increased during the construction stage however depending on the individual proposal, the longer term impact could benefit carbon emissions overall.
Spatial extent: (District wide / local)	The policy aims to meet the needs of the community across the district.

Policy S9: Environment

New development will be located, designed and constructed in ways that reinforce local distinctiveness, respond to climate charge and provide positive solutions for protecting and enhancing environmental assets. Option deviates from Core Strategy by combining criteria from policies on Local Distinctiveness, Flooding and Climate change.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The policy will have a significant positive effect through the preservation and enhancement of the distinctive qualities of Mid Devon's natural landscape and by supporting opportunities within landscape character. Renewable energy development will also be expected to be located in areas of acceptable landscape and wildlife impact, balanced with the wider sustainability benefits of renewable energy. The policy has the primary objective of protecting the special environmental qualities of the landscape setting including within the Blackdown Hills AONB and locations on the edge of AONBs or Dartmoor or Exmoor National Parks. The policy criteria seek the protection and enhancement of designated sites of national and local biodiversity and geodiversity importance, a positive effect. On both designated and undesignated site development will also be expected to protect species populations and linking habitats.	+3	The policy should be considered in the context of other policies within the plan including those on landscape and green infrastructure.	+3
B) Protection and promotion of a quality built and historic environment	The option is considered to have a significant positive effect on the protection and promotion of the built environment through the implementation of high quality sustainable design which reinforces the character and distinctiveness of Mid Devon's historic built environment and also through the preservation and enhancement of Mid Devon's cultural and historic environment. Such as the protection of sites, buildings, areas and features of recognised national and local importance such as listed buildings, conservation areas, scheduled monuments and local heritage assets.	+3		+3
C) Mitigating the effects of climate change	The aim of the policy is to minimise the impact of development on climate change. This policy will have a significant positive effect on climate through the implementation of high quality sustainable design which mitigates and adapts to climate change. The policy however restricts renewable energy development to locations only where there is	+2	The policy should be considered in the context of other policies such as sustainable design.	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	an acceptable local impact, including criteria on visual, nearby residents, landscape character and wildlife. Given the scope of restrictions this policy may have a negative effect depending on how the policy is interpreted. The policy also includes measures to reduce the risk of flooding by guiding development to locations of lowest flood risk by applying a sequential test. On balance a positive effect is considered to occur.			
D) Safeguarding and minimising resource use	The policy is considered to have a significant positive effect by setting out a range of criteria to minimise resource use. The policy option seeks to minimise the impact of development through the efficient use and conservation of natural resources of land, water and energy, minimising pollution and preserving the quality and productivity of the best and most versatile agricultural land wherever possible.	+3		+3
E) Promoting economic growth and employment	No impact.	0		0
F) Supporting retail	No impact.	0		0
G) Meeting housing needs	No impact.	0		0
H) Ensuring community health and wellbeing	The policy seeks the preservation and enhancement of Mid Devon's natural landscape safeguarding areas of high landscape quality for public enjoyment. Given access difficulties to areas of high landscape quality the effect is considered minimal for community well-being.	+1		+1
I) Delivering the necessary infrastructure	No impact.	0		0

Secondary/cumulative/synergistic effects:	Development Managements policies on design, flooding, green infrastructure, protected landscapes/habitats and heritage assets provide detailed criteria for development.
Temporary/permanent effects:	The policy will apply over the lifetime of the Plan up to 2033.

Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	
Spatial extent: (District wide / local)	The policy applies throughout the district and benefits environmental designations (such as AONBs & National Parks) and biodiversity networks across district boundaries.

Policy S10: Tiverton

This policy sets out Tiverton's role as a medium sized market town serving a rural hinterland. The strategy will maintain Tiverton's status as the largest urban area in Mid Devon and increase self-sufficiency of the town and its area by improving access to housing, employment and services for its population and surrounding area. The Council will guide high quality development and other investment to: manage the town centre including an additional 8,000 sqm of gross commercial floor space, improved tourism and visitor role of the town, enhanced walking and cycling and public access to the Tiverton Parkway train station. The green setting of the open hill sides will be retained and the importance of Tidcombe Fen recognised and protected.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The Policy notes that Tiverton will develop in a balanced way as a medium sized market town serving a rural hinterland and aims to retain the green setting provided by the steep open hillsides noting the importance of Knightshayes as a historic parkland to the north of the A361. The policy also ensures the protection of areas of biodiversity value including Tidcombe Fen and green infrastructure. The policy enhances the existing policy by providing flexibility in 'opportunities for enhancement'. The level of development proposed will probably have some negative impact on the natural environment however overall the policy is positive in helping to meet this objective as it aims to protect the natural environment where possible.	+2		+2
B) Protection and promotion of a quality built and historic environment	The impact across Tiverton on the built and historic environment is somewhat unknown as this will be dependent on site location and individual proposals. However the option does aim to achieve high quality development and aspires to manage the town centre so that economic success and heritage reinforce each other. The option also promotes the retention of the green setting of the area particularly the historic parkland of Knightshayes. The level of development is likely to	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	have some negative impacts on the built and historic environment in some locations however the option overall has a positive impact in achieving this objective.			
C) Mitigating the effects of climate change	The impact of the option on mitigating the effects of climate change is somewhat unknown as this is dependent on individual proposals and site locations. Similar to the existing policy the option aims to enhance public transport, walking and cycling opportunities. The existing policy enhances the potential for mitigating the effects of climate change through including the clause 'reduce the risk of flooding' in comparison to this option. Overall the policy option will have a minor positive impact on this objective through encouragement of sustainable travel.	+1	The policy should be read in the context of other policies in the plan which aim to mitigate the effects of climate change and reduce the risk of flooding.	+1
D) Safeguarding and minimising resource use	The impact of this policy on resources is unknown; the level of impact will be dependent on site location and individual proposals. The policy is silent on a number of features regarded in this objective, such as water quality, waste management and resource efficient design. There is potential in the policy through the level of development proposed to negatively impact on resources such as increasing waste levels and loss of agricultural land; however opportunities may also arise from this Policy to improve water quality through design and remediate contaminated land, the level of impact will be on a site by site basis.	0	The policy should be read in the context of other policies in the plan which safeguard and minimise resource use.	0
E) Promoting economic growth and employment	The policy will have a significant positive contribution to this objective as it aims to provide for commercial floorspace to meet the needs of the community which increases jobs and reduces out commuting by focusing commercial floorspace in and around the town. It aims to improve access to employment for its population and that of the surrounding rural areas. It guides high quality development and other investment to ensure that economic success and heritage reinforce each other and promotes shops, leisure, offices and key town centre uses in the town centre.	+3		+3
F) Supporting	The policy will have a significant positive contribution in supporting retail	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
retail	through its provision of commercial floorspace to meet the needs of the community. It will enhance the vitality and viability of the town centre of Tiverton promoting shops and key town centre uses. Enhanced walking and cycling opportunities and bus services around the town particularly to access the town centre is also promoted.			
G) Meeting housing needs	The policy promotes both market and affordable dwellings which will have a significant positive impact on meet housing needs. The figures reflect the latest housing estimates up to 2033 which updates the existing policy in the current plan. The provision of housing in the largest settlement in Mid Devon which had the largest economic concentration and level of social and commercial services suggests that it will be well related to existing services and facilities. The impact of development on the existing services and community facilities is unknown as this will be dependent on the site location individual proposals. The policy also promotes new homes in the town centre to reinforce the economic success and heritage in town centres.	+3		+3
H) Ensuring community health and wellbeing	The policy has a positive impact on this objective as it aims to improve access to housing, employment and services for its population and that of the surrounding rural areas. The town centre is managed to promote new homes, shops, leisure, offices and key town centre uses. The promotion of new housing and commercial floorspace will help reduce poverty and social exclusion. The policy also promotes walking and cycling opportunities which will encourage healthy lifestyles and mitigate air pollution levels. The policy does not account for the provision of open space, sport and recreational opportunities. The impact of this option on noise and light pollution is also unknown.	+2	The policy should however be read in the context of other policies in the plan.	+2
I) Delivering the necessary infrastructure	The policy considers the delivery of infrastructure through improving access to housing, employment and services. It also notes that high quality development and investment will be guided to enhance walking and cycling opportunities and bus services around town, particularly to	+2	This policy should be read in the context of other policies in the plan which set out the delivery of infrastructure.	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	access the town centre and enhance public transport access to Tiverton Parkway Station, Exeter and Taunton. The policy also protects green infrastructure and supports opportunities for enhancement. This policy is likely to have a positive impact on this objective however the impact of this option on existing infrastructure such as roads and telecommunications is unknown.			

Secondary/cumulative/synergistic effects:	The cumulative impact of this policy approach will lead to improved access to housing, employment and services for its population. The impact of this option on the existing infrastructure and services is however unknown but should be read in the context of other policies in the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the plan. Once delivered the majority of the development will be permanent. Features such as public transport and services may change over time according to market demand.
Spatial extent: (District wide / local)	Policy helps meet the housing and commercial needs of the district and meets the needs of the local community.

Policy S11: Cullompton

Preferred Option: Overprovision of Housing (new community at Junction 28)

Cullompton will develop as a growing market town with a strategic role in the hierarchy of settlements in Mid Devon. The strategy aims to improve access to housing within the town through urban extensions, expanding employment opportunities, associated infrastructure and improved services for its population and nearby rural areas. The Council will guide high quality development and other investment to: support the implementation for the Cullompton Air Quality Action Plan, necessary improvements to the M5 motorway junction 28 and new Motorway Junction 28a, promote transport improvements, manage the town centre and enhance the tourism and visitor role.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural	The policy is silent on protecting the natural environment. The level of development which is approximately double of the needs of Cullompton	-2	This policy should be read in the context of other policies which aim	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
environment	is likely to at least have a negative impact on the natural environment due to the scale of development. Wildlife survey 2014 indicates at East Cullompton; Fields are of low wildlife value being agriculturally improved grassland/poor semi-improved grassland/arable. The main interest is in the hedgerows, some of which are mature and species rich. They have the potential to support dormouse and bat species. Most of the hedgerows are likely to be considered as "important" under the Hedgerow Regulation Act 1997. There are several streams, two small areas of woodland and a few veteran trees which are also of wildlife importance. This site has the potential to support roosting, commuting and foraging bats, otter, dormice and badger, and as such further surveys should be carried out before development is considered any further. Features such as hedgerows, woodland, streams and mature/veteran trees should be retained. DBRC has records of the following key species within 1km of the site: otter, dormouse, badger. Bat species from 2-3km from the site. Unconfirmed Wildlife Site within site boundary was a pond originally designated for Great Crested newts. It is unknown if they are still present. Overall a negative effect to wildlife and biodiversity.		to protect the natural environment.	
B) Protection and promotion of a quality built and historic environment	The policy aims to achieve high quality development and aspires to manage the town centre so that economic success and heritage reinforce each other. The scale of development is likely to have some negative impact on the built and historic environment in some locations. The option is silent on the protection and promotion of the built and historic environment outside the town centre and the impact is likely to be dependent on site location and individual proposals and therefore the impact is unknown. This policy approach is therefore likely to have both positive and negative impacts on this objective.	0	The option should be read in the context of other policies which aim to protect and promote the built and historic environment.	0
C) Mitigating the effects of climate	The impact of the policy on mitigating the effects of climate change is somewhat unknown as this is dependent on individual proposals and site	+1	The option should be read in the context of other policies which aim	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
change	locations. Similar to the existing policy the option aims to support the Air Quality Action Plan to enhance walking and cycling opportunities. Further public transport improvements within Cullompton are also promoted. The existing policy however enhances the potential for mitigating the effects of climate change through including the clause 'reduce the risk of flooding' in comparison to this option. As the option does not proactively mitigate the effects of climate change but is likely to reduce carbon emissions through the promotion of sustainable travel and supporting the Air Quality Action Plan the option is likely to have a minor positive impact on this objective.		to mitigate the effects of climate change and reduce the risk of flooding.	
D) Safeguarding and minimising resource use	The impact of this policy on resources is somewhat unknown however the scale of the development to meet approximately double the needs of the community in Cullompton is likely to increase resource use and negatively impact on this objective including the loss of versatile agricultural land however the exact extent of the impact will be based on site locations and individual proposals. The option is silent on a number of features regarded in this objective, such as water quality, waste management and resource efficient design. There is potential in the policy option through the level of development proposed to negatively impact on resources such as increasing waste levels; however opportunities may also arise from this option to improve water quality through design and remediate contaminated land, the level of impact will be on a site by site basis.	-2	The policy should be read in the context of other policies in the plan.	-2
E) Promoting economic growth and employment	The policy will have a significant positive contribution to this objective as it aims to provide for commercial floorspace to meet the needs of the community which increases jobs and reduces out commuting by focusing commercial floorspace in and around the town. It aims to improve access to employment for its population and that of the surrounding rural areas. It guides high quality development and other investment to ensure that economic success and heritage reinforce each other and	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	promotes shops, leisure, offices and key town centre uses in the town centre.			
F) Supporting retail	The policy will have a significant positive contribution in supporting retail through its provision of commercial floorspace to meet the needs of the community. It will enhance the vitality and viability of the town centre of Cullompton promoting shops and key town centre uses. The policy promotes further public transport within Cullompton and to other centres (particularly Tiverton and Exeter).	+3		+3
G) Meeting housing needs	This policy overprovides housing for the local community to help meet the housing needs of the district. The option will therefore enable the housing target to be met and will have a significant positive contribution to this objective. The policy option promotes new homes in the town centre to reinforce the economic success and heritage in town centres. The policy promotes both market and affordable dwellings and should be read in the context of other policies in the plan which provide further detail regarding housing mix and size. The option aims to improve access to housing within the town and improve services for its population.	+3		+3
H) Ensuring community health and wellbeing	The policy is positive on improving access to housing, expanding employment and improving services for its population and that of the nearby rural areas. The town centre is managed to promote new homes, shops, leisure, offices and key town centre uses. Through these means the policy allows for community facilities to be enhanced and will help reduce poverty and social exclusion. The policy option does however promote walking and cycling opportunities which will encourage healthy lifestyles. The implementation of the Cullompton Air Quality Action Plan is also supported to reduce air pollution. Renewable Energy, Carbon Reduction and Air Quality Study (2014) notes the majority of this development lies outside of the Cullompton AQMA and to the East of the M5. The area to the east of the M5 is predominantly rural however there is a small industrial estate and residential properties along the	+2/?	The policy option does not account for the provision of open space, sport and recreational opportunities, the policy should however accord with other policies in the plan which aim to promote these services and facilities. Provision of a dedicated pedestrian and cycle route to the town centre would be included to encourage sustainable travel. Inevitably pollution concentrations in this area will increase with a	+2/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	A373 Honiton Road. Although there is no air quality monitoring in place it is likely that pollution concentrations are much lower than those currently monitored throughout Cullompton Town Centre. The location of this development proposals directly adjacent to the M5 will limit the amount of additional traffic along the local road network, however the potential remains to increase traffic flows in Cullompton itself. Overall a positive but uncertain effect given the unknown impact on the AQMA.		development of this size and have the potential to affect the currently declared AQMA. Existing monitoring indicates that local air quality exceedences in Cullompton are confirmed to the town centre in particular Fore Street therefore appropriate public transport links should be put in place. A development of this size and in such close proximity to an AQMA would require a detailed air quality assessment to quantify the effect of the development on local air quality both within and outside the AQMA should this be taken forward, therefore some uncertainty remains.	
I) Delivering the necessary infrastructure	The policy considers the delivery of infrastructure through improving access to housing, enhancing walking and cycling opportunities around the town, making necessary improvements to the M5 motorway J28 and a new junction J28A to serve the new community at East of Cullompton to maintain highway capacity and safety and promotes further public transport improvements within Cullompton, to other urban centres and access to the rail network. This policy is likely to have a positive impact on this objective however; the impact of this option on existing infrastructure, green infrastructure and telecommunications is unknown.	+2/?	This policy option should be read in the context of other policies in the plan which set out the delivery of infrastructure.	+2/?

Secondary/cumulative/synergistic effects:	The cumulative impact of this policy option will lead to improved access to housing, expanded employment opportunities and improved services for its population. The impact of this option on the

	existing infrastructure and services is unknown but should be read in the context of other policies in the plan. There is the potential for this policy to have a negative impact on the natural environment and the existing services provided.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the plan. Once delivered the majority of the development will be permanent. Features such as public transport and services may change over time according to market demand.
Spatial extent: (District wide / local)	The policy approach for Cullompton will help meet the needs of the local community as well as the housing and employment needs of the district as a whole.

Alterative Option: Meet the needs of the community for housing and commercial floorspace

This policy option aims to meet the housing and commercial floorspace needs of the community.

Sustainability objective	**Commentary**	**Impact**	**Mitigation**	**Post Mitigation**
A) Protection of the natural environment	The policy is silent on protecting the natural environment. The impact on the biodiversity and landscape character at and surrounding Cullompton unknown as the level of impact is likely to be dependent on site location and individual proposals. This option aims to continue to develop Cullompton as a small market town and with a town focus strategy, this will help minimise the impact of development on the natural environment.	0/?	This policy should be read in the context of other policies which aim to protect the natural environment.	0/?
B) Protection and promotion of a quality built and historic environment	The option is likely to have a minor positive impact on this option as it aims to achieve high quality development and aspires to manage the town centre so that economic success and heritage reinforce each other. The option is however silent on the protection and promotion of the built and historic environment outside the town centre and the impact is likely to be dependent on site location and individual proposals, therefore the impact is unknown.	+1/?	The option should be read in the context of other policies which aim to protect and promote the built and historic environment.	+1/?
C) Mitigating the effects of climate change	The impact of the option on mitigating the effects of climate change is somewhat unknown as this is dependent on individual proposals and site locations. Similar to the existing policy the option has a minor	+1/?	The option should be read in the context of other policies which aim to mitigate the effects of	+1/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	positive impact on this objective as it aims to support the Air Quality Action Plan including the construction of a Town Centre relief road and to enhance walking and cycling opportunities. Further public transport improvements within Cullompton are also promoted. The existing policy however enhances the potential for mitigating the effects of climate change through including the clause 'reduce the risk of flooding' in comparison to this option.		climate change and reduce the risk of flooding.	
D) Safeguarding and minimising resource use	The impact of this policy option on resources is unknown as this will be dependent on site locations and individual proposals. The option is silent on a number of features regarded in this objective, such as water quality, waste management and resource efficient design. There is potential in the option through the level of development proposed to negatively impact on resources such as increasing waste levels and loss of agricultural land; however opportunities may also arise from this option to improve water quality through design and remediate contaminated land, the level of impact will be on a site by site basis. The town focus element of this option will help restrict the impact of this option in the Cullompton area by limiting development to meet the needs of the community towards the town.	0/?	The policy should be read in the context of other policies in the plan.	0/?
E) Promoting economic growth and employment	This option will have a significant positive contribution on this objective as it will meet the employment needs of the community which increases jobs and will reduce out commuting by focussing commercial floorspace in and around the town. It aims to expand employment opportunities for its population and that of nearby rural areas. It guides high quality development and other investment to ensure that economic success and heritage reinforce each other and promotes shops, leisure, offices and key town centre uses in the town centre. It updates the existing employment figures for Cullompton in response to up-to-date economic evidence to meet the needs of the community.	+3		+3
F) Supporting	The option will have a significant positive contribution in supporting	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
retail	retail through its provision of commercial floorspace to meet the needs of the community. It will enhance the vitality and viability of the town centre of Cullompton by promoting shops and key town centre uses. It updates the existing employment figures for Cullompton in response to up-to-date economic evidence to meet the needs of the community.			
G) Meeting housing needs	The option updated the existing housing figures for Cullompton in response to up-to-date housing evidence which takes the figures up to 2033. The option there will therefore enable the housing target to be met and will have a significant positive contribution to this objective. It sets out figures for both market and affordable dwellings and aims to improve access to housing within the town and improve services for its population. The option also promotes new homes in the town centre to reinforce the economic success and heritage in town centres. The policy option should be read in the context of other policies in the plan that provide further detail regarding housing mix and size.	+3		+3
H) Ensuring community health and wellbeing	The policy option is positive on improving access to housing, expanding employment and improving services for its population and that of the nearby rural areas. The town centre is managed to promote new homes, shops, leisure, offices and key town centre uses. Through these means the policy option allows for community facilities to be enhanced and will help reduce poverty and social exclusion. The policy option does however promote walking and cycling opportunities which will encourage healthy lifestyles. The option also supports the implementation of the Cullompton Air Quality Action which will help reduce air pollution.	+2	The policy option does not account for the provision of open space, sport and recreational opportunities, the policy should however accord with other policies in the plan which aim to promote these services and facilities. Provision of a dedicated pedestrian and cycle route to the town centre would be included to encourage sustainable travel. Inevitably pollution concentrations in this area will increase with a development of this size and have the potential to	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			affect the currently declared AQMA. Existing monitoring indicates that local air quality exceedences in Cullompton are confirmed to the town centre in particular Fore Street therefore appropriate public transport links should be put in place.	
I) Delivering the necessary infrastructure	The option considers the delivery of infrastructure through improving access to housing, enhancing walking and cycling opportunities around the town, making necessary improvements to the M5 motorway J28 to maintain highway capacity and safety and promotes further public transport improvements within Cullompton, to other urban centres and access to the rail network. This option is likely to have a positive impact on this objective however the impact of this option on existing infrastructure, green infrastructure and telecommunications is unknown.	+2/?	This policy option should be read in the context of other policies in the plan which set out the delivery of infrastructure.	+2/?

Secondary/cumulative/synergistic effects:	The cumulative impact of this policy option will lead to improved access to housing, expanded employment opportunities and improved services for its population. The impact of this option on the existing infrastructure and services is however unknown but should be read in the context of other policies in the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the plan. Once delivered the majority of the development will be permanent. Features such as public transport and services may change over time according to market demand.
Spatial extent: (District wide / local)	Policy helps meet the housing and commercial needs of the district and will meet the needs of the local community.

Alternative Option: Under provision of housing and commercial floorspace

This policy option is an under provision of housing and commercial floorspace to meet the needs of Cullompton in the event that land between J27 and Willand is promoted as the new community which will help meet the needs of the district as a whole.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The option is silent on protecting the natural environment. The impact on the biodiversity and landscape character at and surrounding Cullompton is unknown as the level of impact is likely to be dependent on site location and individual proposals. The under provision of development at Cullompton is likely to minimise the impact on the natural environment in the local area.	0/?	This policy should be read in the context of other policies which aim to protect the natural environment.	0/?
B) Protection and promotion of a quality built and historic environment	The option is likely to have a minor positive impact on this option as it aims to achieve high quality development and aspires to manage the town centre so that economic success and heritage reinforce each other. The option is however silent on the protection and promotion of the built and historic environment outside the town centre and the impact is likely to be dependent on site location and individual proposals and therefore the impact is unknown.	+1/?	The option should be read in the context of other policies which aim to protect and promote the built and historic environment.	+1/?
C) Mitigating the effects of climate change	The impact of the option on mitigating the effects of climate change is somewhat unknown as this is dependent on individual proposals and site locations. Although similar to the existing policy the option aims to support the Air Quality Action Plan including the construction of a Town Centre relief road and to enhance walking and cycling opportunities. Further public transport improvements within Cullompton are also promoted. The existing policy however enhances the potential for mitigating the effects of climate change by including the clause 'reduce the risk of flooding' in comparison to this option. As the option does not proactively mitigate the effects of climate change but can help reduce carbon emissions through sustainable travel and supporting the Air Quality Action Plan, the option is likely to have a minor positive impact on this objective.	+1/?	The option should be read in the context of other policies which aim to mitigate the effects of climate change and reduce the risk of flooding.	+1/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
and minimising resource use	level of impact will be on a site by site basis, however the scale of the development which under provides the needs of the community in Cullompton will limit the impact on resource use. The option is silent on a number of features regarded in this objective, such as water quality, waste management and resource efficient design.		context of other policies in the plan.	
E) Promoting economic growth and employment	This option will have a positive contribution to this objective as it will help provide commercial floorspace, however this only meets approximately 2/3rds of community need in Cullompton. It aims to expand employment opportunities for its population and that of nearby rural areas as well as the district as a whole. It guides high quality development and other investment to ensure that economic success and heritage reinforce each other and promotes shops, leisure, offices and key town centre uses in the town centre.	+2		+2
F) Supporting retail	The option will have a positive contribution in supporting retail through its provision of commercial floorspace. It will enhance the vitality and viability of the town centre of Cullompton by promoting shops and key town centre uses. It does not however meet the need of the community as it under provides.	+2		+2
G) Meeting housing needs	This option under provides housing for the local community and therefore does not meet the needs of the community as a whole. The policy option does however promote new homes in the town centre to reinforce the economic success and heritage in town centres. The policy promotes both market and affordable dwellings. The policy option should be read in the context of other policies in the plan that provide further detail regarding housing mix and size. The option aims to improve access to housing within the town and improve services for its population and overall will have a positive impact on this.	+2		+2
H) Ensuring community health and wellbeing	The policy option is positive on improving access to housing, expanding employment and improving services for its population and that of the nearby rural areas. The town centre is managed to promote new	+1	The policy option does not account for the provision of open space, sport and recreational	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	homes, shops, leisure, offices and key town centre uses. Overall this option is likely to have a minor positive impact as it contributes to this objective however it does not meet the complete needs of the community which suggest that the level of poverty and social exclusion in line with population growth will not be reduced. The policy option does however promote walking and cycling opportunities which will encourage healthy lifestyles. The implementation of the Cullompton Air Quality Action Plan is also supported to reduce air pollution.		opportunities, the policy should however accord with other policies in the plan which aim to promote these services and facilities. Provision of a dedicated pedestrian and cycle route to the town centre would be included to encourage sustainable travel. Inevitably pollution concentrations in this area will increase with a development of this size and have the potential to affect the currently declared AQMA. Existing monitoring indicates that local air quality exceedences in Cullompton are confirmed to the town centre in particular Fore Street therefore appropriate public transport links should be put in place.	
I) Delivering the necessary infrastructure	The option considers the delivery of infrastructure through improving access to housing, enhancing walking and cycling opportunities around the town, making necessary improvements to the M5 motorway J28 to maintain highway capacity and safety. It also promotes further public transport improvements within Cullompton, to other urban centres and access to the rail network. This option is likely to have a positive impact on this objective however the impact of this option on existing infrastructure, green infrastructure and telecommunications is unknown.	+2/?	This policy option should be read in the context of other policies in the plan which set out the delivery of infrastructure.	+2/?

Secondary/cumulative/synergistic effects:	The cumulative impact of this policy option will lead to improved access to housing, expanded

	employment opportunities and improved services for its population. The impact of this option on the existing infrastructure and services is unknown but should be read in the context of other policies in the plan.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Construction will occur over the lifetime of the plan. Once delivered the majority of the development will be permanent. Features such as public transport and services may change over time according to market demand.
Spatial extent: (District wide / local)	The policy option only meets approximately 2/3rds of the housing and employment needs of Cullompton. It will cumulatively help meet the needs of the district as a whole.

Policy S12: Crediton

Preferred Option: Meet Housing Need

Crediton will continue to develop in its role as a small and vibrant market town, serving a rural hinterland in the western part of the district. The strategy aims to improve access to housing within the town, expanding employment opportunities and improve the quality of the existing retail provision. The following development will be supported over the plan period; economic regeneration of the town centre with particular support to improving the quality of existing retail provision, proposal that respect the setting of open areas of hillside and the adjoin historic parks of Creedy Park, Shobrooke Park and Downs, measures that support the Crediton Air Quality Action Plan and enhance the tourism and visitor role of the town and surroundings.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	Crediton will continue to develop in its role as a small and vibrant market town, serving a rural hinterland in the western part of the district**.** Given the lack of suitable development sites within the town and the sensitive landscape of the "Crediton Trough" some new development will need to be located on land of high landscape value, a significant negative effect.	-3	Criteria within the policy however seek only proposals which respect the setting provided by the open areas of hillside and the adjoining historic parkland, a positive effect. The policy should be considered in the context of other policies within the plan including those on biodiversity and landscape.	-1
B) Protection and promotion of a	The policy aims to achieve high quality development and aspires to manage the town centre so that economic success and heritage	0	Criteria within the policy however states that development will be	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
quality built and historic environment	reinforce each other. The scale of development is likely to have some negative impact on the built and historic environment in some locations. The option is silent on the protection and promotion of the built and historic environment outside the town centre and the impact is likely to be dependent on site location and individual proposals and therefore the impact is unknown. This policy approach is therefore likely to have both positive and negative impacts on this objective. The option puts development pressure on the town to expand, potentially into the setting of the nearby historic park lands of Creedy Park, Shobrooke Park and Downs, a negative effect. On-balance the option is considered to have a neutral effect.		supported only where proposals respect the setting of the adjoining historic park land, a mitigating effect. The policy should be considered in the context of other policies within the plan including those on design and the historic environment.	
C) Mitigating the effects of climate change	The policy does not contribute towards minimising the risk of flooding, a slight negative effect.	-1	The policy should be considered in the context of other policies within the plan including those on flooding and climate change.	-1
D) Safeguarding and minimising resource use	In directing development towards Crediton, the option maximises the potential use of underused land, a positive effect. The proposed level of growth within the policy will however require some loss of greenfield land, a negative effect. On-balance a neutral effect is considered.	0	The policy should be read in the context of other policies in the plan.	0
E) Promoting economic growth and employment	The strategy option aims to expand employment opportunities. Criteria within the policy seek to enhance the tourism and visitor role of the town and surrounding countryside. Criteria within the policy allows for development that support the economic regeneration of the town centre and commercial development, a significant positive effect. The option will therefore significantly contribute to meeting the employment needs of the community, encourage inwards investment and promote future prosperity.	+3		+3
F) Supporting retail	The strategy aims to improve the quality of the existing retail provision within the town. Criteria within the policy allow for development that support the economic regeneration of the town centre and other key town centre uses which support the town centre's viability and vitality, a	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	significant positive effect. Particular support will be given for proposals which improve the quality of existing retail provision within the town centre. The policy seeks an average development rate of 170 sqm commercial floorspace per annum of which a portion will be expected to be retail. On balance a positive effect is considered given the uncertainty surrounding the retail target.			
G) Meeting housing needs	Crediton will continue to develop in its role as a small and vibrant market town, serving a rural hinterland in the western part of the district. The strategy aims to improve access to housing within the town by setting an average development rate of 27 market and 9 affordable dwellings per annum. This option provides sufficient development to meet the town's housing needs, a significant positive effect. This approach will also improve access to local services and facilities a further positive.	+3		+3
H) Ensuring community health and wellbeing	Historically poor air quality is a factor which has an impact on Creditons development, with the town being a designated Air Quality Management Area as a result of unacceptably high levels of airborne pollutants in the centre of the settlement. New development may impact on air quality, a negative effect. The proposed level of growth at Crediton will improve cultural, sport and recreation opportunities, enable walking and cycling and promote healthy lifestyles, a positive effect. On balance, given the positive and negative effects, a neutral effect is considered appropriate. Renewable Energy, Carbon Reduction and Air Quality Study (2014) notes the new link road in Crediton linking the A377 to March Lane and The Lord Meadows Industrial Estate in an attempt to cut congestion and improve air quality along the A377 through Crediton. Development in Crediton will increase pollution concentrations as a result of additional traffic using the local road network and has the potential to significantly affect local air quality should additional vehicles need to travel through the town centre. Should the link road not lead to a revocation of the AQMA, it is likely	0/?	A criterion in the policy seeks the continuation of measures to support the implementation of the Crediton Air Quality Action Plan, beyond the completion of the Crediton link road if still required. Uncertainty remains and the effect of development on local air quality has not yet been quantified.	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	that preferred sites options taken forward in Crediton would require an air quality assessment to quantify the effect of the development on local air quality both within and outside the AQMA, therefore some uncertainty is considered.			
l) Delivering the necessary infrastructure	The policy strategy directs development to Crediton a sustainable settlement helping to reduce the overall need to travel, reducing traffic congestion and increasing access to key services, a significant positive effect.	+3	The policy should be considered in the context of other policies within the plan including those on infrastructure.	+3

Secondary/cumulative/synergistic effects:	The cumulative impact of this policy option will lead to improved access to housing, expanded employment opportunities and improved services for its population. The impact of this option on the existing infrastructure and services is unknown but should be read in the context of other policies in the plan. There is the potential for this policy to have a negative impact on the natural environment and the existing services provided
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered permanent.
Spatial extent: (District wide / local)	The policy applies to within the settlement limits of Crediton only.

Alternative Option: Under provision due to local constraints

The strategy aims to improve access to housing within the town, expand employment opportunities and improve the quality of the existing retail provision. Due to the physical constraints of the town's topography, less development was allocated in 2010 than was set out in the Core Strategy (only a total of 413 dwellings and 4,150 square metres employment floorspace). Option 2 continues the approach set out in the Allocations & Infrastructure DPD by providing less development as a result of the constraint provided by the challenging local topography.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The housing number under Option 2 are calculated based on only including allocated sites that have not yet been built out, and other sites assessed under the SHLAA process (Strategic Housing Land	+2	Criteria within the policy however seek only proposals which respect the setting provided by the open	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Availability Assessment) that are deliverable without having large landscape and/or visual impacts. The employment figure has been calculated based on existing allocations not yet built out. Given the housing and commercial targets are based on allocations that do not need to compromise the landscape setting of Crediton, a positive effect is considered.		areas of hillside and the adjoining historic parkland, a positive effect. The policy should be considered in the context of other policies within the plan including those on biodiversity and landscape.	
B) Protection and promotion of a quality built and historic environment	The policy option states that all proposals within the town centre will need to play a positive role in sustaining and enhancing the significance of the areas heritage, a positive effect. The housing number under Option 2 are calculated based on only including allocated sites that have not yet been built out, and other sites assessed under the SHLAA process (Strategic Housing Land Availability Assessment) that are deliverable without having large landscape and/or visual impacts. The employment figure has been calculated based on existing allocations not yet built out. On-balance the option is considered to have a neutral effect.	0	Criteria within the policy however states that development will be supported only where proposals respect the setting of the adjoining historic park land, a mitigating effect. The policy should be considered in the context of other policies within the plan including those on design and the historic environment.	0
C) Mitigating the effects of climate change	The policy option does not contribute towards minimising the risk of flooding, a slight negative effect.	-1	The policy should be considered in the context of other policies within the plan including those on flooding and climate change.	-1
D) Safeguarding and minimising resource use	In directing development towards Crediton, the option maximises the potential use of underused land, a positive effect. The proposed level of growth within the policy will however require some loss of greenfield land, a negative effect. On-balance a neutral effect is considered.	0	The policy should be read in the context of other policies in the plan.	0
E) Promoting economic growth and employment	The strategy option aims to expand employment opportunities. This option provides less development as a result of the constraint provided by the challenging local topography. The employment figure has been calculated based on existing allocations not yet built out. Criteria within the policy seek to enhance the tourism and visitor role of the town and surrounding countryside. Criteria within the policy allows for	-2		-2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	development that support the economic regeneration of the town centre and commercial development, a significant positive effect. Given this option does not meet all of Crediton's commercial needs a negative effect is anticipated. This option therefore only slightly contributes to meeting the employment needs of the community, encourages inwards investment and promotes future prosperity.			
F) Supporting retail	The strategy aims to improve the quality of the existing retail provision within the town. Criteria within the policy allow for development that support the economic regeneration of the town centre and other key town centre uses which support the town centre's viability and vitality, a significant positive effect. Particular support will be given for proposals which improve the quality of existing retail provision within the town centre. The policy seeks an average development rate of 208 sqm commercial floorspace per annum of which a portion will be expected to be retail. On balance a positive effect is considered given the uncertainty surrounding the retail target.	+2		+2
G) Meeting housing needs	The strategy aims to improve access to housing within the town by setting an average development rate of 16 market and 8 affordable dwellings per annum. This Option provides less development as a result of the constraint provided by the challenging local topography. The housing number under Option 2 has been calculated based on including allocated sites that have not yet been built out, and other sites assessed under the SHLAA process (Strategic Housing Land Availability Assessment) that are deliverable without having large landscape and/or visual impacts. Given this option does not meet all of Crediton's housing need a negative effect is anticipated. This approach will also improve access to local services and facilities a positive effect.	+2		+2
H) Ensuring community health and wellbeing	Historically poor air quality is a factor which has an impact on Crediton's development, with the town being a designated Air Quality Management Area as a result of unacceptably high levels of airborne	0	A criterion in the policy seeks the continuation of measures to support the implementation of the	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	pollutants in the centre of the settlement. New development may impact on air quality, a negative effect. The proposed level of growth at Crediton will improve cultural, sport and recreation opportunities, enable walking and cycling and promote healthy lifestyles, a positive effect. On balance, given the positive and negative effects a neutral effect is considered appropriate.		Crediton Air Quality Action Plan, beyond the completion of the Crediton link road if still required.	
l) Delivering the necessary infrastructure	The policy strategy directs development to Crediton a sustainable settlement helping to reduce the overall need to travel, reducing traffic congestion and increasing access to key services, a significant positive effect.	+3	The policy should be considered in the context of other policies within the plan including those on infrastructure.	+3

Secondary/cumulative/synergistic effects:	The cumulative impact may lead to increased house prices and a lack of affordable housing. It would however result in no adverse impacts on landscape around the Town and retention and protection of the natural environment. Developer contributions towards infrastructure may not meet targets for essential infrastructure in the town and the policy would not contribute towards the reduction of flooding.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered permanent.
Spatial extent: (District wide / local)	The policy applies to within the settlement limits of Crediton only.

Policy S13: Villages

Policy identifies a list of 22 rural settlements designated as villages and suitable for small scale housing, employment, tourism and leisure, services and facilities and limited development that enhances community vitality or meets local social or economic need. The policy deviates from Core Strategy through the identification of Bampton as a rural village. The definition of “rural village” within the supporting text has also been simplified to require settlements to only require three key services for inclusion; an education facility, convenience store and transport service. Based on the amended criteria, Holcombe Rogus is identified as an additional settlement. Burlescombe (including Westleigh) did not meet the essential criteria. Yeoford does not meet the essential criteria of the policy as it does not have a shop however it has been included as an exception because of its strong transport links, a bus and daily train service.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	Development is limited to minor proposals within the defined settlement limits, a significant positive effect in protecting the countryside. Hemyock is located in the Blackdown Hills Area of Outstanding Natural Beauty (AONB).	+3	The policy should be read in the context of other policies in the plan.	+3
B) Protection and promotion of a quality built and historic environment	The policy makes no reference to the built or historic environment. A large number of the villages have conservation areas.	0	The protection of the historic environment is justified in policies elsewhere in the plan.	0
C) Mitigating the effects of climate change	The policy makes no reference to climate change mitigation or flood risk. The option directs some limited growth to villages with the most services therefore reducing the need to travel, a minor positive effect.	+1		+1
D) Safeguarding and minimising resource use	The policy makes no reference to safeguarding or minimising resources.	0		0
E) Promoting economic growth and employment	Criteria within the policy allow for employment, tourism and leisure development within rural settlements and development that enhances community vitality and social and economic needs, a significant positive effect towards economic growth and employment in the district.	+3		+3
F) Supporting retail	Criteria within the policy allow for services and facilities within rural settlements and development that enhances community vitality and social and economic needs, a significant positive effect towards supporting the self-sufficiency of rural shopping.	+3		+3
G) Meeting housing needs	National planning policy advocates the provision of market housing in rural areas where it would facilitate the delivery of significant affordable housing required to meet housing need. To facilitate the provision of affordable housing in villages across Mid Devon, the supporting text of the policy clarifies that some market housing may be permitted. Rural exception sites will also be considered in line with development	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	management policies and an existing Supplementary Planning Document on Meeting Housing Needs. In appropriate circumstances, self-build housing will be permitted through the exceptions policy. The policy is supportive of small scale housing, a significant positive effect.			
H) Ensuring community health and wellbeing	The policy criteria allow for service and facilities serving the locality and other limited development which enhances community vitality or meets a local social or economic need. The policy contributes towards maintaining and enhancing community facilities, provision of open space and the district's cultural sport and recreation opportunities. This wording directly accords with the SA objective to ensure community health and well-being, a significant positive effect. The supporting text lists transport services as one of the key criteria for defining rural settlements and therefore the list of 22 settlements will be locations most accessible by public transport. The option does not consider light, noise or air pollution, a negative effect. On-balance the policy is considered still to have a significant positive effect.	+3	The policy should be read in the context of other policies in the plan.	+3
I) Delivering the necessary infrastructure	The supporting text clarifies that rural settlements should include an education facility, convenience store and transport service to be listed as a sustainable location for development. Burlescombe (including Westleigh) did not meet the essential criteria and are not proposed to be carried forward. Yeoford does not meet the essential criteria of the policy as it does not have a shop however it has been included for its strong transport links with provision of a bus and daily train service, a positive effect. The policy directs development to sustainable locations helping to reduce the overall need to travel, reducing traffic congestion and increasing access to key services, a significant positive effect. As the criteria do not list access to health or social care, this option could be directing development away from the most sustainable locations in respect of health, a negative effect. On-balance the policy option is considered to still have a positive effect.	+2	The policy should be read in the context of other policies in the plan.	+2

Secondary/cumulative/synergistic effects:	The policy should work alongside Policy S3 Meeting Housing Need which sets out an exception test for affordable housing and self-build. The policy does not prevent the cumulative impact of development within the policy or through other development management policies.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered permanent.
Spatial extent: (District wide / local)	Policy is restricted to land within defined settlement limits of villages.

Preferred Option: Bampton as a Village

The option for Bampton to be re-classified from a Town to a Village is preferred. Each site would be expected to provide 30% affordable housing.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	An appropriate number of sites to reflect the status of Bampton being a village. Development is limited by the topographical constraints a negative impact. Impacts on the natural environment will be on a site by site basis.	-1	Policy S9 Environment ensures that the impacts of developments are minimised while preserving and enhancing the natural environment.	0
B) Protection and promotion of a quality built and historic environment	Development would need to reflect the current built and historic environment and have consideration of the conservation area of Bampton. A positive impact.	+1	Policy S9 Environment ensures Mid Devon's historic environment is preserved and enhanced.	+1
C) Mitigating the effects of climate change	Development may increase surface water run-off. A negative impact. Bampton is quite constrained due to flood risk, and developments would need to be assessed on a site by site basis. Bampton has a number of services and facilities, reducing the need to travel, a positive impact. Bampton has a regular bus service, a positive impact.	+1	Other policies in the plan seek the provision of a sustainable urban drainage scheme to deal with surface water from the development and arrangements for future maintenance, a positive effect is considered.	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
D) Safeguarding and minimising resource use	The land surrounding Bampton is agricultural grade 3 and 4. The majority of land within the District falls within Grade 3, moderate to good agricultural land. A slight negative impact.	-1		-1
E) Promoting economic growth and employment	Bampton has a good level of services, shops and employment. There is one employment allocation within Bampton which currently has planning permission. This development could potentially enhance community vitality and social and economic needs. A positive impact.	+1		+1
F) Supporting retail	The developments within Bampton would help to support the local retail within the village centre through an increase in population. A positive impact.	+1		+1
G) Meeting housing needs	Development around Bampton would contribute towards meeting the housing need in the village. A positive impact. As Bampton is classified as a village, a target of 30% affordable housing would be sought on all housing sites. A positive impact.	+2	Policy S3 Meeting housing needs would seek 30% affordable housing on all sites within the village.	+2
H) Ensuring community health and wellbeing	Policy S13 Village contributes towards maintaining and enhancing community facilities, provision of open space and the district's cultural sport and recreation opportunities. Development in the village will result in a higher population, meaning more facilities and services will be used and supported, ensuring services and facilities are retained in the village. A positive impact.	+1		+1
I) Delivering the necessary infrastructure	The nature of the road within Bampton limits the level of traffic that can be supported through the settlement. A negative impact. Bampton contains a number of services and facilities, a positive impact. Overall a neutral impact.	0		0

Secondary/cumulative/synergistic effects:	The policy should work alongside Policy S3 Meeting Housing Need which sets out an exception test for affordable housing and self-build. The policy does not prevent the cumulative impact of development within the policy or through other development management policies.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered permanent.

Spatial extent: (District wide / local)	Policy is restricted to land within defined settlement limits of Bampton.

Alternative Option: Bampton as a Town

The option for Bampton to be retained as a Town over re-classified of it becoming a village. Each site within Bampton would be expected to provide 25% affordable housing.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	Development would be limited by topographical constraints to protect the landscape and landscape character of Bampton. A negative impact. Developments would not be permitted where they may damage the two Sites of Special Scientific Interest which are located to the north east and west of Bampton.	-1	Policy S9 Environment ensures that the impacts of developments are minimised while preserving and enhancing the natural environment.	0
B) Protection and promotion of a quality built and historic environment	Development would need to reflect the current built and historic environment and have consideration of the conservation area of Bampton. A positive impact.	+1	Policy S9 Environment ensures Mid Devon's historic environment is preserved and enhanced.	+1
C) Mitigating the effects of climate change	Development may increase surface water run-off. A negative impact. Bampton is quite constrained due to flood risk, and developments would need to be assessed on a site by site basis. Bampton has a number of services and facilities, reducing the need to travel. Bampton has a regular bus service, a positive impact.	+1	Other policies in the plan seek the provision of a sustainable urban drainage scheme to deal with surface water from the development and arrangements for future maintenance, a positive effect is considered.	+2
D) Safeguarding and minimising resource use	The land surrounding Bampton is agricultural grade 3 and 4. The majority of land within the District falls within Grade 3, moderate to good agricultural land. A slight negative impact. Residential and commercial development will be on a much larger scale if Bampton is a town, and would result in large areas adjoining the town potentially being	-2		-2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	developed. A negative impact.			
E) Promoting economic growth and employment	Bampton has a good level of services, shops and employment. The amount of commercial developments would be higher than those in villages. Commercial development could potentially enhance community vitality and social and economic needs. A positive impact. Increasing the amount of employment in Bampton may result in more in-commuting from the surrounding area. The local road network would not be suitable for large quantities of vehicle or HGVs. A negative impact. Overall a positive impact.	+1		+1
F) Supporting retail	The developments within Bampton would help to support the local retail within the village centre through an increase in population. A positive impact. New development on the edge of the town could come forward on commercial sites, taking away footfall from the town centre. A negative impact. A neutral impact overall.	0	Policy S7 would seek for new retail, leisure and office space and other key uses to be located in town centres. These forms of development would be permitted outside the town centre where they met the criteria set out in Policies S7 and DM15.	0
G) Meeting housing needs	Development around Bampton would contribute towards meeting the housing need in the village. A positive impact. As Bampton is classified as a town, a target of 25% affordable housing would be sought on all housing sites. A positive impact.	+2	Policy S3 Meeting housing needs would seek 25% affordable housing on all sites within the town.	+2
H) Ensuring community health and wellbeing	Development would contribute towards maintaining and enhancing community facilities, provision of open space and the district's cultural sport and recreation opportunities. Development in the town will result in a higher population, meaning more facilities and services will be used and supported, ensuring services and facilities are retained in the village. Developments for services and facilities would be able to come forward on commercial sites. Overall a positive impact.	+2		+2
I) Delivering the necessary infrastructure	Bampton is not located near the strategic road network and difficulty would arise through trying to connect it. A negative impact. The nature of the road within Bampton limits the level of traffic that can be	-1		-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	supported through the settlement. A negative impact. Bampton contains a number of services and facilities, a positive impact. Overall a negative impact.			

Secondary/cumulative/synergistic effects:	The policy should work alongside Policy S6 Employment and Policy S7 Town Centres to focus new retail, leisure, office and other key uses in the centre of Bampton The policy does not prevent the cumulative impact of development within the policy or through other development management policies.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered permanent.
Spatial extent: (District wide / local)	Policy is restricted to land within defined settlement limits of Bampton.

Policy S14: Countryside

Policy restricts development outside the settlements defined by Policies S10-S13 to that which will enhance the character, appearance and biodiversity of the countryside while promoting sustainable diversification of the rural economy. Policy deviates from the Core Strategy through a change in the definition of affordable housing which can now include market housing and reference to rural workers rather than agricultural or forestry workers. The option also introduces appropriate residential conversion of existing buildings and amends horse riding establishments to equestrian development. Golf facilities are no-longer specifically mentioned.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The policy strictly controls development outside of defined settlement boundaries (Policies S10-S13) to a limited number of uses that promote sustainable diversification of the rural economy, a significant positive effect in protecting the countryside. The policy also requires development to enhance the character, appearance and biodiversity of the Countryside, reinforcing this significant positive effect.	+3		+3
B) Protection	The policy options allows for the residential conversion of existing	-2		-2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
and promotion of a quality built and historic environment	buildings and appropriately scaled and designed extensions and other physical alterations, but does not reference the appropriate use and/or access to buildings of historical / cultural value, a negative effect.			
C) Mitigating the effects of climate change	Policy allows for renewable energy proposals in the countryside, a significant positive effect towards mitigating the effects of climate change. The policy does not contribute towards minimising the risk of flooding, a negative effect. On balance the option is considered to therefore have a positive effect.	+2	The policy should be considered in the context of other policies within the plan including those on flooding and climate change.	+2
D) Safeguarding and minimising resource use	The policy allows for the conversion of existing buildings and appropriately scaled and designed extensions and other physical alterations, a significant positive effect towards the re-use of previously developed land and buildings. The policy restricts development in the open countryside minimising the loss of greenfield land. Policy supports development such as residential conversions and other uses in rural locations often with few connections to the existing waste water / sewage network, although alternative storage solutions exist, this option is considered to have only a slight negative effect. On balance this option is considered to have a positive effect to the safeguarding and minimising resource use.	+2		+2
E) Promoting economic growth and employment	The policy is particularly supportive of development that promotes the sustainable diversification of the rural economy, a significant positive effect towards economic growth. The policy includes criteria for appropriately scaled, retail, employment, farm diversification, agricultural and equestrian development, tourism and leisure related development, a further positive effect. Other criteria include equestrian development, renewable energy and telecommunications which are all activities that can further contribute to the rural economy and inward investment.	+3		+3
F) Supporting retail	The policy includes criteria for appropriately scaled, retail development that will enhance the self-sufficiency of rural shopping, a significant	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	positive effect.			
G) Meeting housing needs	The central aim of the policy is to strictly control development in the open countryside, outside settlement limits to that which will enhance the character, appearance and biodiversity of the countryside while promoting sustainable diversification of the rural economy. The policy significantly restricts market housing in the open countryside therefore reducing access to market housing, a negative effect. National policy allows for Rural workers dwellings and the conversion of rural dwellings. The policy is however more supportive of affordable housing to meet local needs, gypsy and traveller accommodation and residential conversions, a significant positive effect. On-balance a neutral effect is considered to best represent the positive and negative effects.	0		0
H) Ensuring community health and wellbeing	Community facilities, such as education facilities, buildings associated with public open space, transport and infrastructure proposals will be permitted, a significant positive effect towards community health and well-being. The option does not consider light, noise or air pollution a negative effect or encourage sustainable means of travel either through, walking, cycling or public transport, a negative effect. On-balance a minor positive effect is considered.	+1	The policy should be read in the context of other policies in the plan.	+1
I) Delivering the necessary infrastructure	Community facilities, such as education facilities, buildings associated with public open space, transport and infrastructure proposals will be permitted, a significant positive effect towards infrastructure provision. This approach provides better access to schools, supports telecommunications, reduces traffic congestion and the unacceptable pressure on existing infrastructure. The option does not specifically reference health facilities, a slight negative effect.	+3		+3

Secondary/cumulative/synergistic effects:	The policy does not prevent the cumulative impact of development within the policy or through other development management policies. The policy should work alongside Policy DM6 Rural Exception Sites, DM8 Rural Workers' Dwellings, DM9 Conversion of Rural Buildings and DM10 Replacement Dwellings in Rural Areas.
Temporary/permanent effects:	Development will occur throughout the lifetime of the plan up to 2033 and the effect should be considered

Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	permanent.
Spatial extent: (District wide / local)	The policy applies district wide with the exception of sites within defined settlement limits (Policies S10-S13).

Site Allocations

SA framework – appraisal guidance [Allocations]

The following table sets out the general guidance followed when applying the pre-mitigation scoring system to potential allocation sites. In some cases the scoring may differ from this guidance due to site specific context. A cumulative approach was taken when assessing allocation sites within each objective.

Sustainability objective	Elements covered	Pre-Mitigation	Post-Mitigation
A) Protection of the natural environment	Habitats and biodiversity; flora and fauna; protected species; landscape; geodiversity	Neutral impact • If the site is within a town or existing development forms a backdrop of the site • If the site is appropriately screened, for example by being hidden in a fold of a hill Slight negative impact • Small site on the landscape (less 100 dwellings/10,000sqm) • Impact on a Tree Preservation Order • Impact on a protected landscape • Impact on local wildlife • Loss of hedgerows that provide screening • Existing development forms a backdrop but the site is highly visible Negative impact • Large site on the landscape (100 dwellings/10,000sqm +) • Site is highly visible and there is no existing development forming a backdrop	
B) Protection and	Heritage assets, including listed buildings,	Positive impact • Large scale town centre improvements	

Sustainability objective	Elements covered	Pre-Mitigation	Post-Mitigation
promotion of a quality built environment	conservation areas, scheduled ancient monuments, registered parks and gardens, locally listed assets, archaeology; design and quality of development	Slight positive impact • Small scale town centre improvements • Good relationship with the settlement Slight negative impact • Impact on Listed Buildings / Conservation Area • Impact on Archaeological potential • Poor relationship with the settlement	
C) Mitigating the effects of climate change	Reduced flood risk; promotion of low carbon or renewable energy; reductions in carbon emissions; walking and cycling provision; low carbon buildings	Slight positive impact • Bus service • Train service Neutral impact • Flood zone 1 • No train services (as limited areas have a train service and therefore it would not necessarily be expected of all areas in Mid Devon) Slight negative impact • Small scale development, potential impact on groundwater (less 100 dwellings/10,000sqm) • No delivery of Sustainable Urban Drainage • Small watercourse • Source Protection Zone • No bus service • Large scale sites due to potential carbon impact Negative impact • Large scale development, potential impact on groundwater (100 dwellings/10,000sqm +) • Flood Zone 2/3	
D) Safeguarding and minimising resource use	Quality of soils, including contaminated land; water quality, including consideration of water framework directive	Positive impact • Brownfield land Neutral impact • Small scale grade 4-5 agricultural land Slight negative impact	

Sustainability objective	Elements covered	Pre-Mitigation	Post-Mitigation
	objectives; minimisation of waste; impact on best and most versatile agricultural land	• Large scale grade 4-5 agricultural land • Small scale grade 3 agricultural land • Minerals Consultation Zone Negative impact • Small scale grade 1-2 agricultural land • Large scale grade 3 agricultural land • Contaminated land Significant Negative Impact • Large scale grade 1-2 agricultural land *Small scale = <20ha* *Large scale = >20ha*	
E) Promoting economic growth and employment	Increasing jobs; reducing out-commuting; skills training; growth of rural businesses; tourism provision	Significant positive impact • Large scale commercial development Positive impact • Small scale commercial development Slight positive impact • Large scale residential development Neutral impact • Small scale residential development Negative impact • Small scale loss of commercial development Significant negative impact • Large scale loss of commercial development *Small scale = <100 dwellings / 10,000sqm* *Larger scale = > or equal to 100 dwellings /10,000sqm*	
F) Supporting retail	Safeguarding the vitality and viability of town centres; relationship between new development and town	Significant positive impact • Commercial development within a town centre Positive impact • Large scale residential development within a town (> or equal to 100 dwellings) Slight positive impact	

Sustainability objective	Elements covered	Pre-Mitigation	Post-Mitigation
	centres	• Small scale residential development within a town (< 100 dwellings) Neutral impact • Commercial development outside of a town centre • Residential or commercial development within a village	
G) Meeting housing needs	Supply of housing; housing mix; house size; housing affordability; appropriate housing density to location; proximity to services and facilities	Significant positive impact • Residential large scale development Positive impact • Residential medium scale development Slight positive impact • Residential small scale development Neutral impact • Commercial development *Small scale* = 1-19 dwg *Medium scale* = 20-99 dwg *Large scale = 100+dwg*	
H) Ensuring community health and wellbeing	Community support for proposals; access to open space and recreation; limiting air, noise and light pollution to levels that do not damage human health or natural systems; integrated and sustainable forms of travel including walking, cycling and public transport; social deprivation; safe and secure environments	Positive impact • Provides a community service Slight positive impact • Town sites - walking distance to services Neutral impact • Village sites - designated village Slight negative impact • Pollution • Town sites – beyond walking distance to services • Village sites - not a designated village • Village sites – designated village but large development e.g. 100+ housing • Requires footpath provision • Loss of undesignated recreational land • Impact but not loss of designated open space Negative impact	

Sustainability objective	Elements covered	Pre-Mitigation	Post-Mitigation
		• Loss of a community service • Loss of a designated Local Green Space • Large site which will require new community services and facilities	
I) Delivering the necessary infrastructure	Roads and transportation; schools; health services; community facilities; green infrastructure; telecommunications	Positive impact • Significant infrastructure e.g. relief road Slight positive impact • Green infrastructure is provided Neutral impact • Access is achievable • School has capacity for additional development Slight negative impact • No infrastructure provided, small site (<100 dwellings/10,000sqm) • School is at capacity, places can be supported through developer contributions • Access is achievable but would require additional works Negative impact • School is at capacity, development proposed would require a new school	

Tiverton Preferred Site Allocations

Policies TIV1-5: Eastern Urban Extension

A site of 153 hectares at Tiverton Eastern Urban Extension is allocated for mixed used development including 1,520 dwellings, 35% affordable to include at least five pitches for gypsies and travellers and at least 30,000 square metres commercial floorspace. 47ha of green infrastructure, transport provision, environmental protection, community facilities, agreed phasing and compliance with adopted Masterplan and completion of public Masterplanning exercise in respect of the southeast (site B).

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	6.91ha of the site forms part of Tidcombe Fen which is a SSSI. A number of trees are in the centre of the site. There are records of common dormice nests, badger setts, otters and water voles within the site. The canal to the south of the site is a conservation area, County Wildlife Site and Local Nature Reserve. The site sits either side of an intermediate ridge within a wide valley floor plateaux running from the east of Tiverton in the west beyond the M5 to the east. The land slopes steeply down from this ridge to both the north and south with more level ground to the west and centre of the site. The site is typified as being an open, low lying flat landscape which is agriculturally prosperous. Developing this area will extend the built up area of the town, from an agricultural landscape, which will be a significant change. Given the presence of an important protected area (SSSI), landscape change and biodiversity there is potential for development on this site to negatively impact on species, habitats and sites designated for their nature conservation interests.	-3	The policy requires 'environmental protection and enhancement' which will help mitigate the impact on this objective however the level of development on the site will nevertheless have an impact on the character of the area. TIV3 sets out these measures in detail including; the protection and strengthening of trees and other features, maintaining wildlife networks, designation of an area of green infrastructure around Tidcombe Lane Fen & the Grand Western Canal, providing public open space and allotments, strategic landscaping, measures to protect the biodiversity of Tidcombe Lane Fen SSSI and strategic green infrastructure including park land and open space.	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
B) Protection and promotion of a quality built and historic environment	The site contains two listed buildings which are located towards the south. The site also contains some Scheduled Ancient Monuments including one Long Barrow located in the north of the site. There is also an area of archaeological potential. The site contains pockets of housing and other existing development. The level of development will be a large urban extension significantly larger than the existing development at post hill. The eastern part of the Blundell's Conservation Area, the Railway Walk, runs through the site, on the boundary of the Green Infrastructure and Housing allocation. Design of the development would need to respect the conservation area and enhance it where possible. Overall, a negative effect.	-2/?	The adopted masterplan (site A) and future Masterplanning exercise in respect of the southeast of the site (site B) will help to minimise the impact on the built and historic environment through good design. TIV3 seeks detailed archaeological investigation and measures to record and protect archaeological interest and design solutions that respect the setting of listed buildings within and adjoin the site. It is however likely that there will be some negative impact on this sustainability objective due to the scale of development proposed and the presence of heritage assets which could be affected by this development.	-1/?
C) Mitigating the effects of climate change	The majority of the site is in flood zone 1 with a small water course to the south east which has a flood zone of 2 and 3. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir. Development on the site may increase surface water run-off. A negative effect. Transport provision to ensure appropriate accessibility for all modes is also supported. There are no existing services or facilities however the draft policy promotes community facilities to meet local needs arising. Given the scale of the development at this site it is likely some negative impacts will occur with regard to carbon emissions through construction	-3	Built development is entirely in flood zone 1 and TIV3 seeks SUDs to deal with surface water run-off. The policy requires carbon reduction and air quality improvements and will help mitigate the effects of climate change. A waste to energy plant is also mentioned in the supporting text as a potential addition to the	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	and increased traffic movement. Overall a negative effect is considered.		employment area. This will help minimise the overall carbon footprint of the development. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. 47 hectares of green infrastructure will mitigate any impacts on the Grand Western Canal with a buffer zone to allow access for maintenance and repair. Taking into account flood risk and mitigation measures for climate change an overall slight positive effect is considered.	
D) Safeguarding and minimising resource use	The majority of the site is made up of Grade 2 agricultural land based on 1991 mapping data which was surveyed by the resource planning group. It is likely that this site will have a negative impact on this objective due to the scale of development of a site that is predominantly Grade 2 agricultural greenfield land. The site scores negatively in this objective. 1.33 ha of the site is contaminated land being a former hospital. The Devon Waste Local Plan has identified a site within the Urban Extension as having potential for a 'waste-to energy' plant.	-3	Although the remediation of contaminated land at the former hospital is a positive effect, the overall loss of Grade 2 agricultural land is still considered a significant negative effect.	-3
E) Promoting economic growth	The development of this site would not result in the loss of any employment land. The policy for the Eastern Urban Extension allocates	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
and employment	at least 30,000 m2 of employment floorspace. The site would provide the opportunity to enhance this sustainability objective. The level of employment floorspace allocated is justified by recent evidence provided by the Employment Land Review. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would be some positive impact.			
F) Supporting retail	The provision for retail is uncertain however the opportunity to provide for retail on-site is provided by the allocation of at least 30,000 sqm of commercial floorspace. The impact on the Tiverton town centre is also uncertain as there could be both positive and negative impacts. However overall it is likely there will be a positive impact on the support for retail with a large scale housing development in the largest town in the district.	+2	Development proposals should reflect the adopted masterplan (site A) and completion of public Masterplanning exercise in respect of the southeast (site B) which identifies land for a neighbourhood centre which could include a convenience store and shopping.	+2
G) Meeting housing needs	The site allocation will provide for 1,520 dwellings which will include 35% affordable housing and to include at least five pitches for gypsies and travellers. The site therefore will have a significant positive impact on meeting housing needs for the district.	+3		+3
H) Ensuring community health and wellbeing	Option will contribute towards light and noise pollution, a slight negative effect. Option will contribute towards additional pressure on existing community facilities including; open space, parks and sports provision. Renewable Energy, Carbon Reduction and Air Quality Study (2014) recognise that the eastern urban extension is likely to result in the largest change in local air quality as the development is large in size. The Eastern urban extension received 14 objections during the consultation. It is suggested this relatively low number of objections represents the advanced stage in the planning process the site has now reached, having been allocated in 2011 and a masterplan (site A) adopted in 2014. An outline planning applications for 330 dwellings has	-1	TIV3 makes provision for areas of equipped and laid out public open space including children's play, sports pitches and allotments as well as strategic green infrastructure including park land, open space and local nature reserve. The rout and setting of the Grand Western Canal is retained. The policy also promotes the delivery of community facilities to	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	also been approved subject to the early provision of highways infrastructure.		meet local needs arising and transport provision to ensure appropriate accessibility for all modes. This suggests that opportunities for sustainable forms of travel may arise.	
l) Delivering the necessary infrastructure	There are potential highway capacity issues around this site which would require enhancements before this site is developed. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Places are mostly needed at the Tiverton EUE, which is the largest area of development by far. The masterplan for the area and forthcoming developments include the provision of a school site that can accommodate up to 420 places, which should be sufficient to meet the demand in Tiverton. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given pressures on education and highways capacity a negative effect is anticipated.	-2	TIV5 includes an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. TIV3 includes the provision of Green Infrastructure. TIV2 sets out agreed transport provision including a new junction to the A361, traffic calming and pedestrian access. Sustainable modes of transport are also supported. TIV4 makes provision for a primary school and contributions towards secondary school places. The site is therefore likely to deliver the necessary infrastructure for the site which may also benefit the surrounding community. A positive effect is considered to result.	+2

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of

	infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Overall the development of this site will help meet the housing needs of Tiverton and the district as a whole. Additional primary school capacity will be needed to accommodate the developments. This would be most suitably provided through a new 420 primary school located in the local centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time of the site is approximately 10 years. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help provide housing in the district. Development would be focussed as an extension to the biggest town in the district.

Policy TIV6: Farleigh Meadows

A site of 11.2 hectares at Farleigh Meadows is allocated for residential development, subject to; 300 dwellings (35% affordable), amenity open space within the flood zone, two vehicular points, cycle and pedestrian routes, protection of TPOs, design and landscaping & mitigation of impact on air quality.

Sustainability objective	**Commentary**	**Impact**	**Mitigation**	**Post Mitigation**
A) Protection of the natural environment	The accompanying Landscape and Visual appraisal report with the planning application (12/00277/MOUT) indicates that whilst the site at Farleigh Meadows comprises pasture, arable farmland and floodplain, the immediate setting of the Site, and hence the character of its locality, is heavily influenced by adjacent built development and urban areas. The landscape surrounding the Site can therefore be described as 'urban fringe' in character. In particular, the visible residential properties adjacent to Rackenford Road and Washfield Lane together with other built developments including Tiverton and District Hospital, Tiverton High School, East Devon College and the Exe Valley Leisure	-2	Criteria with the policy seek the protection of TPOs and incorporation into open space where appropriate, a neutral effect. The policy also seeks careful design and landscaping treatment of the boundary between housing and amenity open space taking into account view north and east. Policy S9 'Environment' and DM1 'High	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Centre contribute to this urbanising effect. The study concluded that the site is therefore less sensitive to change than a landscape where strong landscape characteristics remain. The site has a number of Oak Trees which are protected by TPOs. The planning application (12/00277/MOUT) ecology report considered the loss of a number of mature oak trees has potential for impacts on roosting bats and/or nesting birds, loss of short sections of hedgerow along Washfield Lane and the northern boundary has potential for impacts on dormice and/or nesting birds. The loss of a limited number of existing houses along Rackenford Road has potential for impacts on nesting birds (e.g. swifts, house sparrows) and/or roosting bats and loss of rough margins around the boundary of the arable field has potential for impacts on common reptiles and/or amphibians. The report concluded that there were no reasons why the planning application should be delayed if mitigation measures proposed are implemented.		Quality Design' in the Local Plan Review also provide some mitigation towards landscape and biodiversity impact. An overall minor negative effect givenf the scale of development proposed in this location.	
B) Protection and promotion of a quality built and historic environment	The site has the potential to impact on views from Knightshayes, a Historic Park and Garden, and this should be considered in the layout, design and landscaping, a slight negative effect.	-1	The policy also seeks careful design and landscaping treatment of the boundary between housing and amenity open space taking into account view north and east. An overall neutral effect.	0
C) Mitigating the effects of climate change	SFRA (2014) confirms that the site is located partly in Flood zone 1 to the west and Flood Zone 2&3 in the east from the Mill Leat and/or the River Exe, a negative effect. The site also has surface water flood risk on parts of the site. A negative effect.	-2	The policy option notes that 300 dwellings will be on land in flood zone 1. Criteria within the policy seek mitigation measures through retention of land in the floodplain as informal amenity open space. A policy requirement in the Local Plan Review seeks mitigation measures through the provision of	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Overall a neutral effect.	
D) Safeguarding and minimising resource use	Development option is located on approximately 40% grade 2 agricultural land to the west and 60% of grade 4 agricultural land to the east. Development option is located on greenfield land which would be lost if this site is developed. Overall this has a negative effect on this sustainability objective.	-2		-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1		+1
F) Supporting retail	The site is located within walking distance to the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+2		+2
G) Meeting housing needs	The site provides for 300 new dwellings of which 35% should be affordable a contribution towards future housing need, a significant positive effect.	+3		+3
H) Ensuring community health and wellbeing	The site is located within walking distance of Tiverton Town Centre. Option will contribute towards light and noise pollution, a slight negative effect. The Renewable Energy, Carbon Reduction and Air Quality Study (2014) recognises that land proposed for development at Farleigh Meadows already has resolution to grant planning permission and an air quality assessment has been produced as part of the planning process. The air quality assessment concluded that the significance of the allocation is negligible to slight adverse. The report	-1	The policy requires 3 hectares of informal amenity open space with appropriate security measures to prevent access to and pollution of the Mill Leat. The option also requires pedestrian and cycle routes and measures to mitigate impact on air quality on Leat	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	concludes that development at Farleigh Meadows will result in an increase in pollutant concentrations along Rakenford Road and Leat Street however the air quality assessment indicates that this will not result in an exceedence of the relevant air quality objective. The development will also contribute towards additional pressure on existing community facilities including; open space, parks and sports provision. There were no objections received to the allocation of the site from the Options consultation and two letters of support were received.		Street. Overall this will have a positive impact on this sustainability objective.	
I) Delivering the necessary infrastructure	The development proposal is expected to place greater pressure on existing road infrastructure, a minor negative effect. The Mid Devon Community Infrastructure Evidence Report has incorporated pupil generation impacts of developments which have already secured permission but not yet been built, such as Farleigh Meadows. These pupils have been included in the projected number on roll for Spring 2017, to reflect anticipated future pupil numbers. Developer contributions will be required in order to fund these improvements. Given pressures on education and highways capacity a negative effect is anticipated.	-2	Criteria within the policy require two vehicular access points and cycle and pedestrian links between Rackenford Road, Higher Loughborough and Washfield Lane, incorporating and enhancing the Exe Valley, a positive effect. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The potential cumulative impact of the development of this site on traffic, pressure on local services and facilities and the current provision of infrastructure should be mitigated by the policy criteria. Overall the development of this site will help meet the housing needs including affordable housing of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	An outline planning application for development at Farleigh Meadows has been resolved to be granted subject to a Section 106 planning obligation being finalised.

	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help provide housing in Tiverton. Development would within the biggest town in the district and within walking distance to the town centre.

Policy TIV7: Town Hall / St Andrew Street

A site of 0.5 hectares at St Andrews Street is allocated for residential development, subject to; 55 dwellings (28% affordable), protection of the character of adjoin listed buildings and enhances the setting of the River Exe, Archaeological investigation and flood evacuation access routes.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	As the site is located within the settlement of Tiverton there would be minimal impact on landscape character. There may be some impact on the setting of the River Exe.	0	The policy option requires design which enhances the setting of the River Exe. Overall this is considered to be a minor positive effect.	+1
B) Protection and promotion of a quality built and historic environment	There are listed buildings adjoining the site. Option could impact negatively on the historic environment, a slight negative effect.	-1	Criteria within the policy seek design which protects the character of the adjoining listed buildings and enhances the setting of the River Exe. The policy also requires the archaeological investigation and appropriate mitigation. Overall a neutral effect.	0
C) Mitigating the effects of climate change	The site is within the 100 year floodplain, although behind a flood wall. The site is located partly in Flood zone 1 to the east and Flood Zone 2 & 3 in the west. Development on the site may increase surface water run-off. A negative effect. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or	-3	Criteria within the policy seek mitigation measures through raised ground floors and the provision of flood evacuation access routes. A policy requirement in the Local Plan Review seeks	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Wimbleball Reservoir. Overall a negative effect.		mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. If mitigation measures are incorporated, a neutral effect is considered.	
D) Safeguarding and minimising resource use	Development option is located on 'urban' brownfield land. The policy option also incorporates the conversion of buildings adjoining St Andrew Street, a positive effect.	+2		+2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	Option is located within walking distance to the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1		+1
G) Meeting	Policy provides for 55 new dwellings of which 28% should be affordable a contribution towards future housing need, a positive effect. The site	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
housing needs	has planning permission for retirement apartments that will contribute towards meeting the needs of the towns aging population.			
H) Ensuring community health and wellbeing	The site is located within walking distance of Tiverton Town Centre, a minor positive effect. One letter of support and one of objection were received during the options consultation process.	+1		+1
I) Delivering the necessary infrastructure	The site is accessible. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given the small scale of development it is anticipated that this development will not as an individual site put pressure on the local secondary schools. Overall a slight negative effect is considered reflecting primary school capacity.	-1	Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The development overall will help add to meeting the housing including affordable housing of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The site has planning permission for 45 retirement apartments, excluding the 14 dwellings to be provided through conversion of buildings adjoining St Andrew Street. Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. Once developed, the development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Tiverton including the provision of affordable housing. Development would be within Tiverton, the largest town in the district.

Policy TIV8: Moorhayes Park

A site of 0.4 hectares at Moorhayes Park is allocated for residential development, subject to; 8 dwellings, access from Hayne Court and archaeological investigation.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	An outline planning application for eight dwellings on the site was submitted in August 2013 (ref 13/01149/MOUT). The Wildlife Survey that accompanies the outline planning application concludes, after having undertaken a preliminary ecological appraisal notes that the site is of limited ecological value. This site falls within the built up area of Tiverton and as a result there will be no landscape impact, a neutral effect.	0		0
B) Protection and promotion of a quality built and historic environment	This site lies in an area where there is known prehistoric activity, a slight negative effect.	-1/?	The policy requires archaeological investigation and appropriate mitigation. It is therefore likely that this will have a neutral impact.	0/?
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk. The site could contribute to surface water run off without appropriate mitigation measures. The town leat flows along the eastern boundary of the site for which flood risk information is unknown, overall a negative and uncertain effect.	-2/?	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. A Flood Risk Assessment would be required to determine the impact of the unnamed watercourses. If development avoided areas of	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			flood risk this would mitigate any impact. Overall a neutral effect. Uncertainty remains as the impact of the unnamed watercourse is not yet known.	
D) Safeguarding and minimising resource use	The site is located on Grade 2 very good quality agricultural land, a negative effect. 50% of the site is contaminated land, without mitigation noted in the policy this is a negative impact.	-2	Although the remediation of contaminated land is a positive effect, the overall loss of Grade 2 agricultural land is still considered a negative effect.	-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1		+1
G) Meeting housing needs	Option provides for 8 new dwellings a contribution towards future housing need in Tiverton, a slight positive effect.	+1		+1
H) Ensuring community health and wellbeing	Services are available on Lea Road and Tiverton town centre is relatively close, a slight positive effect. There were no objections received to the allocation of the site from the Options consultation and two letters of support were received.	+1		+1
I) Delivering the necessary infrastructure	As existing access from Hayne Court is adequate and the site is well connected within Moorhayes with pedestrian and cycle routes throughout. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will	-1	The policy option notes that access will be provided from Hayne Court. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given the small scale of development it is anticipated that this development will not as an individual site put pressure on the local secondary schools. Overall a slight negative effect is considered reflecting primary school capacity.		improved infrastructure and facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The estimated development time for this site is 1 year. A developer has applied to build on the site although for a lower number of houses; nevertheless the timescale of this development is likely to be short. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Policy TIV9: Howden Court

A site of 0.53 hectares at Howden Court is allocated for residential development, subject to; 10 dwellings, junction capacity assessment and pedestrian and cycle route.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The landscape impact would not be significant as the site is well screened and has significant tree cover, a neutral effect.	0		0
B) Protection and	Land is located near to the Grade II Listed Howden Court, although no negative impact is anticipated, a neutral effect.	0		0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
promotion of a quality built and historic environment				
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest probability of flooding, a neutral effect. Potential for increased surface run-off without mitigation measures.	-1	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Overall a neutral effect.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land with no agricultural grade, given the sites scale a slight negative effect.	-1/?		-1/?
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	Option is located within walking distance to the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1		+1
G) Meeting housing needs	Option is well related to the existing built form at Tiverton, a positive effect. Option provides for 10 new dwellings a contribution towards future housing need, a slight positive effect.	+1		+1
H) Ensuring community health and wellbeing	The site is located within walking distance of Tiverton Town Centre and there are a number of shops, a school, a bus stop and other services close by, a minor positive effect. Two letters of support were received	+1		+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	and one objection during the options consultation.			
I) Delivering the necessary infrastructure	The proposed scale of development can be accommodated. Should the scale of development (cumulatively) exceed 50 dwellings then a right turning lane would be required from the A396. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given pressures on education and highways capacity a negative effect is anticipated.	-2	To mitigate transport impact criteria seek the Submission of a Junction Capacity Assessment to determine the need for a right turning lane from the A396 into Howden Court and provision of a pedestrian and cycle route from Howden Court to Palmerston Park. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The impact of developing this site is expected to be minimal. Density is expected to be low and the level of development is at a level where harm is not expected. The development overall will help add to meeting the housing and the commercial needs of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time of the site is approximately 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Tiverton including the provision of affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Policy TIV10: Roundhill

A site of 0.4 hectares at Roundhill is allocated for residential development, subject to; 13 affordable dwellings and Investigation of ground stability and implementation of appropriate remediation works.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site contains mature hedgerows and trees which form a visual break between the higher and lower parts of the existing development, a neutral effect. Development of the area would result in the loss of hedgerows and trees, a minor negative effect.	-1	Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review also provide some mitigation therefore a neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	There are potential historic mineshafts in the area.	?	It is expected that reports of historic mineshafts should be investigated before site works begin. An unknown impact.	?
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk, a neutral effect. Surface water run-off may be increased without appropriate mitigation measures, a negative effect.	-1	The policy option requires investigation of ground stability and implementation of appropriate remediation works. A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Overall a neutral effect.	0
D) Safeguarding and minimising resource use	This site is located on brownfield land, a positive effect.	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	Option is located within walking distance to shops and services. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1		+1
G) Meeting housing needs	Option provides for 13 new affordable dwellings a contribution towards future housing need, a slightly positive effect.	+1		+1
H) Ensuring community health and wellbeing	The site is within walking distance to West Exe and the town centre although up a steep gradient and there are bus stops located on Seven Crosses Hill. There are pedestrian footpaths around the site. Given the sites distance from the town centre and public transport connectivity an overall minor positive effect is considered. The development proposal received one letter of support and two letters of objection during the options consultation.	+1		+1
I) Delivering the necessary infrastructure	The topography of the site would be a constraint to the deliverability of the site, as well as potential historic mineshafts in the area (which are currently being investigated). There is existing highway access however the loss of the garages may impact on the parking provision for the area. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements.	-1	Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Given pressures on education capacity a slight negative effect is anticipated.			

Secondary/cumulative/synergistic effects:	The cumulative impact of developing this site is expected to be minimal. The development overall will help add to meeting the affordable housing needs of Tiverton.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time of the site is approximately 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide some of the affordable housing need within Tiverton. Development would be focussed in Tiverton, the largest town in the district.

Policy TIV11: Palmerston Park

A site of 0.9 hectares at Palmerston Park is allocated for residential development subject to; 15 affordable dwellings and Habitat and protected species reports including a programme of appropriate mitigation and compensation for loss of a protected habitat if appropriate; and investigation of ground stability and implementation of appropriate remediation works.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	There are a number of tall trees on the eastern boundary and the site is elevated above the road. Northern part of the site is within a Deciduous Woodland Priority Habitat. The site currently comprises trees and scrubland. The site falls within the 'River valley slopes and coombes' landscape character area. The area often has steep, wooded sides and a strong sense of enclosure with a lush valley landscape. There is a potential impact on the landscape character due to the lack of trees on the elevated part of the site. The site is visible from the east side of the River Exe. As the site will be small scale but will have an impact on a	-2	Habitat and protected species reports including a programme of appropriate mitigation and compensation for loss of a protected habitat if appropriate. Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review provide mitigation for both the impact on the landscape	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Priority Habitat a negative impact on this sustainability objective is anticipated.		and the natural environment a neutral effect is considered.	
B) Protection and promotion of a quality built and historic environment	No impact.	0		0
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk. Surface water run-off would increase without appropriate mitigation measures, a negative effect.	-1	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Overall a neutral effect.	0
D) Safeguarding and minimising resource use	The site is located on greenfield land which has no agricultural land class. There are potential mine shafts in the vicinity of the site, which are currently being investigated, a minor negative effect.	-1/?	Investigation of ground stability and implementation of appropriate remediation works.	-1/?
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1		+1
G) Meeting housing needs	Option provides for 15 affordable dwellings, a contribution to future housing needs. A slight positive effect.	+1		+1
H) Ensuring community health	Development of this site would result in the loss of the current use as a park. There are pedestrian footpaths leading into the town centre and a	0		0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
and wellbeing	bus stop at Palmerston Park. The site is within walking distance to West Exe shops and services within Tiverton Town Centre. On balance development of this site is felt to have a neutral effect. The option received two letters of support and one letter of objection during the options consultation.			
l) Delivering the necessary infrastructure	The topography of the site would be a major constraint as it is very steep where it is adjacent to the road. There is no current access to the site. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Reiew. Developer contributions will be required in order to fund these improvements. Overall due to the lack of infrastructure development of this site may have a negative effect.	-2	Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The development will help meet the affordable housing needs in Tiverton.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time for this site is 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help meet the affordable housing needs within Tiverton. Development would be focussed in Tiverton, the largest town in the district.

Policy TIV12: Phoenix Lane

A site of 1.4 hectare at Phoenix Lane is allocated for redevelopment as a high quality shopping, leisure and residential area with accessible public space including 60 dwellings with 28% affordable housing and 8,000 square metres of mixed commercial floorspace, redesign of bus station with taxi rank, pedestrian link between Phoenix Lane and the Pannier market, Retention or relocation of the war memorial, design that enhances the character,

appearance and setting of heritage assets, retention of the listed building, Gotham House, Adequate parking and service areas, archaeological investigation, the provision of Sustainable Urban Drainage (SUD) and masterplanning exercise.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This is a town centre site located within an existing built up area, with no anticipated impact on landscape character, a neutral effect.	0		0
B) Protection and promotion of a quality built and historic environment	The site is within the conservation area, and contains a number of listed buildings as well as some in close proximity to the site. The site also includes a War Memorial. The Tiverton Conservation Area Appraisal notes that the Commemorative park the war memorial is situated in is a visually important green space. Development in this location would impact the conservation area and listed buildings, a negative effect.	-2	The policy TIv12 f) requires outstanding design that announces the southern entrance to Tiverton's primary shopping area while enhancing the character and appearance of the Conservation Area and avoiding significant adverse impact to listed buildings. Part e) and f) of the policy will provide mitigation for if the War Memorial does need to be re-located within the site. Criteria i) requires archaeological investigation and appropriate mitigation, g) retention of the listed building, Gotham House retention. On balance although the development would impact the conservation area and listed buildings, enhancement of the site would have a minor positive impact on this sustainability objective.	+1
C) Mitigating the	The site is located in Flood zone 1 the lowest level of flood risk. The site	-2	The policy option requires the	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
effects of climate change	could contribute to surface water run off without appropriate mitigation measures. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir.		provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. If mitigation measures are incorporated a neutral effect is considered.	
D) Safeguarding and minimising resource use	This site is located on brownfield land, a positive effect.	+2		+2
E) Promoting economic growth and employment	Development of this site may result in the loss of some employment space however the policy provides for 8,000 square metres of mixed commercial floorspace including retail, office and leisure uses. On balance this would have a positive effect on this sustainability objective through the provision of employment space and enhancement of the site.	+2		+2
F) Supporting retail	The site is located within the town centre. Development of this site may result in the loss of some employment space however the policy provides for 8,000 square metres of mixed commercial floorspace including retail, office and leisure uses. On balance this would have a significant positive effect on this sustainability objective through the	+3	The policy option requires outstanding design that announces the southern entrance to Tiverton's primary shopping area, therefore helping to enhance the vitality and	+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	provision of retail and leisure space and enhancement of the site.		viability of the town centre, a significant positive effect.	
G) Meeting housing needs	The policy option requires 60 dwellings including 28% affordable housing. This helps to meet the housing needs of Tiverton including affordable housing, a positive effect.	+2		+2
H) Ensuring community health and wellbeing	The site currently includes the bus station. The Renewable Energy, Carbon Reduction and Air Quality Study (2014) notes that the primarily commercial site of Phoenix Lane is located in the town centre and includes enhancement of the bus station. It is anticipate that this would provide an opportunity to improve local bus services and encourage the use of these which has the potential to have a beneficial effect on air quality as a result. The site is in a town centre location where there are a wide range of services. The development of this site may impact on the pedestrianized public space which includes a war memorial garden, an unknown effect. The development proposal received one letter of support and one letter of objection during the options consultation.	?	The policy requires the redesign and enhancement of the bus station and inclusion of taxi rank. The policy option requires improved pedestrian access between Phoenix Lane and Pannier Market, and between Phoenix Lane and the multi-storey car park. The policy also requires adequate parking and service areas to serve the needs of existing and proposed uses. Overall development of this site would have a positive impact on this sustainability objective.	+2
I) Delivering the necessary infrastructure	Phoenix Lane pedestrianized walk currently provides access from Phoenix Lane to Fore Street. The far north of the site includes land which connects the Fore Street from the Market Walk to the market itself. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements.	-1	The policy requires the redesign and enhancement of the bus station. Improved pedestrian access between Phoenix Lane and the Pannier market, and between Phoenix Lane and the multi-storey car park. Adequate parking and service areas to serve the needs of existing and proposed uses. Overall some enhancement of the infrastructure of the site will be	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Given school capacity issues a minor negative effect is considered.		provided and will therefore have a minor positive impact on this sustainability objective. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities.	

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs including affordable housing in Tiverton. The development also adds to mixed commercial floorspace which will enhance Tiverton town centre, the largest town in the district.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	During construction there may be some short term temporary interruptions to some services. The estimated development time for this site currently unknown. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing including affordable housing within Tiverton. Development would be focussed in Tiverton, the largest town in the district. Development of the town centre has the potential to benefit the surrounding area of Tiverton who use Tiverton town centre for shopping and retail.

Policy TIV13: Tidcombe Hall (Contingency)

A site of 5 hectares at Tidcombe Hall is allocated for residential development, subject to; 100 dwellings (28% affordable) Vehicular access point on to Canal Hill and improvements to Tidcombe Lane, walking and cycling enhancements and connection to surrounding public rights of way and green infrastructure, protection of the setting of the Grand Western Canal, Tidcombe Hall and conservation areas and archaeological investigation.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of	The site contains mature hedgerows and trees and the canal is also a defined County Wildlife Site & Local Nature Reserve. The site falls	-2	The policy option requires the protection of the setting of the	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
the natural environment	within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. There is a potential, but localised impact on character as the site is reasonably well contained within the landscape. There would be some impact arising from development, though this would be against the backdrop of the existing built environment to the west, a negative effect.		Grand Western Canal, Tidcombe Hall and Conservation Areas, a slight negative effect.	
B) Protection and promotion of a quality built and historic environment	The site is located on the south eastern edge of Tiverton and is close to the Grand Western Canal Conservation Area with 1.6ha of the site is within the Grand Western Canal Conservation Area (19% northern part). This site includes the site of the medieval chapel of St Lawrence and Tidcombe Hall. The site lies just to the west of Tidcombe Farmhouse which contains Tidcombe Hall, a 19th century house that was formerly a rectory. There is also a record of a domestic chapel at this site that was licensed in the early 15th century. A desk-based assessment followed by appropriate archaeological mitigation would be required.	-2/?	The policy requires the protection of the setting of the Grand Western Canal, Tidcombe Hall and Conservation Areas. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required. The scale of development proposed has been significantly reduced on this site to protect heritage assets.	-1/?
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir. Development on the site may increase surface water run-off. A negative effect. There is also an unnamed watercourse flowing through the site for which there is no flooding data available, overall a negative and uncertain effect.	-3/?	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Policy criteria, seeks walking and cycling enhancements and	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			connection to surrounding public rights of way and green infrastructure. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. If mitigation measures are incorporated a neutral effect is considered. Uncertainty remains as the impact of the unnamed watercourse is not yet known.	
D) Safeguarding and minimising resource use	The site is made up of a variation of land which has a number of different grades, including urban land and grade 1 agricultural land. Development option is located partly on greenfield land which would be lost if this site is developed. As approximately 75% of the site is made up of Grade 1 and Grade 2 agricultural land, development of this site will have a negative impact on this objective.	-3		-3
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land . Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1		+1
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
G) Meeting housing needs	Option provides for 100 new dwellings a contribution towards future housing need and includes provision for affordable housing, a significant positive effect.	+3	Site capacity has been reduced from 200 to 100 dwellings to reflect site constraints.	+3
H) Ensuring community health and wellbeing	There are shops along Canal Hill which are easily accessible, but the site is not within walking distance of Tiverton town centre, a slight negative effect. There are bus stops located on Tidcombe Lane and a footpath on the opposite site of Tidcombe Lane leading to Canal Hill.	-1	Policy criteria, seeks walking and cycling enhancements and connection to surrounding public rights of way and green infrastructure.	0
I) Delivering the necessary infrastructure	A key factor is access. Tidcombe Lane has limited width without footways and Tidcombe Bridge is similar. Improvements to Tidcombe Lane will be necessary northwards from the site to ensure the safety of pedestrians, although not necessarily to increase its traffic capacity. A single vehicular access point on to Canal Hill will need to be supplemented with a secondary emergency access designed to be located at the end of the main cul-de-sac within the site. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given school capacity and site access issues a negative effect is considered.	-2	Criteria within the policy seek a vehicular access points from Canal Hill and improvements to Tidcombe Lane northwards from the site, a neutral effect. The scale of development proposed has been significantly reduced on this site to minimise traffic on the highways network. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The development overall will help meet the housing needs of Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. An estimated development time has not been stated by the proposer and is therefore unknown.

Spatial extent: (District wide / local)	This site option will help provide housing within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Policy TIV14: Wynnards Mead, Bakers Hill (Contingency)

A site of 6.3 hectares at Wynnards Mead, Bakers Hill is allocated for residential development, subject to; 70 dwellings (28% affordable), design that minimises impact to landscape character and setting of the adjoining listed building and unlisted building (Wynnards Mead), upgrading the lane to provide vehicular access point with the existing access to Wynnards Mead to forma a secondary access for pedestrian and cyclists and site contamination assessment with mitigation for the historic quarry.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This site falls within the 'River valley slopes and coombes' landscape character area. This area typically falls within the River Exe valley and often has steep, wooded sides and a strong sense of enclosure within a lush valley landscape. The site is elevated, and therefore is visible from a number of viewpoints, including Seven Crosses Road to the south. Accordingly, there would be some impact from development in this location, a negative effect.	-2	The site capacity has been reduced to 70 dwellings down from 100 dwellings to reflect site constraints. The policy requires design which minimises impact to the landscape character, overall a minor negative impact with this mitigation measure.	-1
B) Protection and promotion of a quality built and historic environment	The site, which lies to the west of Tiverton, consists of the grounds of a large house called 'Wynnards Mead', including some associated agricultural land and two cottages. Gotham Farm adjoins the site to the west. The site is in close proximity to a listed building to the immediate west of the site, a slight negative effect.	-1	Criteria within the policy requires design which protects the character and setting of the adjoining listed buildings and the unlisted house within the site 'Wynnards Mead', a neutral effect.	0
C) Mitigating the effects of climate change	The site is set on the north side of the Cottey Brook, sloping down north to south. The largest portion of the site in the north is located in flood zone 1, the lowest risk of flooding. The southern edge of the site is within flood zone 3 where the Cottey Brook runs along the southern boundary. Development could lead to increased surface water run-off, a negative effect.	-2	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			future maintenance. On balance it is felt that development of this site would have a neutral effect.	
D) Safeguarding and minimising resource use	2.1ha (33% S and W) of the site is located on Grade 3 very good quality agricultural land, 4.2ha (67% NE) of the site is located on unclassified agricultural grade and a small area of contaminated land (historic quarry, 0.06ha in north). On balance development of this site would result a minor negative impact on this objective.	-1/?	Criteria in policy require site contamination assessment and remediation to mitigate risks associated with the historic quarry to the north of the site. Due to the partially known agricultural grade of land, the retention of an unknown and negative impact would be considered.	-1/?
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land.. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be a minor positive impact.	+1		+1
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1		+1
G) Meeting housing needs	Option provides for 70 new dwellings a contribution towards future housing need including affordable housing, a significant positive effect.	+2		+2
H) Ensuring community health and wellbeing	The services and facilities of Tiverton lie some 1.2 km distant. The site is located within walking distance to Tiverton town centre and is close to a bus service into Tiverton. The development option received four letters of objection during the options consultation.	+1		+1
I) Delivering the necessary	An adequate site access is achievable however the existing carriageway and footway links to Tiverton are very steep. The Mid Devon Community Infrastructure Evidence Report indicates that there are six	-2	Policy proposes the upgrading of the lane to 'Wynnard's Cottages' to provide the vehicular access point	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
infrastructure	primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given school capacity and site access issues a negative effect is considered.		with widening of the frontage. The existing access to the house Wynnard's Mead to form a secondary access for pedestrians and cyclists. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The development overall will meet the housing needs of Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time for this site is 3 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district. The provision of 70 dwelling will help meet the housing needs of the district as a whole.

Policy TIV15: Tiverton Infrastructure

The Council will use CIL and planning obligations and where appropriate external sources of funding to deliver the following infrastructure; new junction onto the A361 to serve Tiverton EUE, public realm improvements and traffic calming to Blundells Road, increased capacity at Heathcoat Way, bus service enhancements, expansion and improved primary and secondary education facilities, emergency fire and rescue services, healthcare facilities, community facilities and works to reduce flood risk.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	No anticipated effects.	0		0
B) Protection and promotion of a quality built and historic environment	No anticipated effects.	0		0
C) Mitigating the effects of climate change	The policy seeks provision of works to reduce flood risk, a positive effect.	+2		+2
D) Safeguarding and minimising resource use	No anticipated effects.	0		0
E) Promoting economic growth and employment	No anticipated effects.	0		0
F) Supporting retail	No anticipated effects.	0		0
G) Meeting housing needs	Provision of new junction onto A361 to serve Tiverton EUE is needed to unlock strategic housing development in this location. A positive effect.	+2		+2
H) Ensuring community health and wellbeing	The Council will use CIL and planning obligations and where appropriate external sources of funding to deliver the following infrastructure; emergency fire and rescue services, healthcare facilities, community facilities (GP surgery, children/ youth & community hall) and works to reduce flood risk. This is all infrastructure required to ensure Tiverton's community health and wellbeing over the course of the Plan period, a significant positive effect.	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
I) Delivering the necessary infrastructure	The Council will use CIL and planning obligations and where appropriate external sources of funding to deliver the following infrastructure; new junction onto the A361 to serve Tiverton EUE, public realm improvements and traffic calming to Blundells Road, increased capacity at Heathcoat Way, bus service enhancements and expansion and improved primary and secondary education facilities. This is all infrastructure required to deliver Tiverton's strategic growth over the course of the Plan period, a significant positive effect.	+3		+3

Secondary/cumulative/synergistic effects:	This policy supports many of the other Tiverton policies and collects funds towards necessary pieces of local infrastructure. This infrastructure is required to mitigate traffic impacts associated with existing and future developments in the town.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The policy will have impacts over the lifetime of the plan, as monies will be gathered during all periods with development only likely to take place in the longer term.
Spatial extent: (District wide / local)	The impacts of the policy are likely to be wider than just Tiverton – as improvements to Tiverton's infrastructure / community facilities will serve a wider rural catchment.

Tiverton Alternative Site Options

Hartnoll Farm, Tiverton

Option

A site of 70 hectares at Hartnoll Farm could be allocated for residential development including 1100 dwellings, 28% affordable housing subject to further assessment of viability. Transport provision, environmental protection, community facilities, carbon reduction, agreed phasing and a public Masterplanning exercise are also required.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site is located in the open countryside. The site comprises a number of fields which are bounded by mature hedgerows and trees throughout the site. The site is bordered by the Grand Western Canal Conservation Area to the south and east of the site. The canal is also a County Wildlife Site and Local Nature Reserve. The supporting text to the policy states that if the site is allocated, land adjacent to the Grand Western Canal would need to be protected from development and set aside as green infrastructure. Development of the site would have a potential significant visual impact and would impact on the biodiversity and habitats of the area. Wildlife survey 2014 indicates; Fields are of low wildlife value being agriculturally improved grassland and arable crops. Some of the field margins are wide and support coarse grassland which may provide hunting areas for barn owls. Hedgerows throughout the site are thick and mostly species rich. Likely to have value for bats and dormice. Most of the hedgerows are likely to be considered as “important” under the Hedgerow Regulation Act 1997. There are many mature hedgerow trees and some in-field trees. Some of these may be veteran or notable. The abandoned railway line is a key feature with woodland and scrub, and provides an important corridor and links to the Grand Western Canal. Several badger setts found on site as well as latrines and paths. It is likely that badgers use much of the site, especially around the abandoned railway and in the largest arable field. Deer paths and droppings found and many common birds seen and heard. Grand Western Canal forms the southern boundary and is a County Wildlife Site and a further wildlife corridor. This site has the potential to support roosting, commuting and foraging bats, dormice and badger and as such further surveys should be carried out before development is considered any further. Features such as hedgerows, woodland/scrub along the abandoned railway and mature/veteran trees should be retained. DBRC	-2	The policy requires environmental protection and enhancement which will help mitigate any negative impact on this objective by the development of this site. Land adjacent the Grand Western Canal will need to be protected as Green Infrastructure.	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	has records of the following key species within 1km of the site: brown hare, otter, dormouse, badger, Daubenton's, Noctule & Pipistrelle bats, barn owl. The Phase I habitat survey for site (Devon Biodiversity Records Centre, June 2014) states: "The site is of overall moderate wildlife value. The site is large and comprises a range of habitat types. Of the habitats present the hedgerows are considered to provide the greatest value for wildlife as they are mature, well connected and species-rich. Furthermore, the linear woodland and scrub along the dismantled railway, whilst small is moderately species-rich, and is also well connected in the wider landscape through the hedgerow network. The hedgerows and woodland add to the structural diversity of the area. If the site is subject to development it is recommended that the hedgerows and woodland are retained where possible." The Landscape and Visual Appraisal concludes: This site is quite separate from existing development at Post Hill on higher ground to the west, and Halberton to the east beyond the canal. However, with the Tiverton East Urban Extension development would come up to Manley Lane, the western boundary of the site. In terms of its relationship to the countryside, the site is closely related to the canal and country path, but also provides a clear gap between the proposed edge of Tiverton and the settlement of Halberton, with a distinct change of character. In terms of visibility, the site is visible from the canal, from the Post Hill/Halberton Road and from the hills to the south, although from limited viewpoints. From the road and from the south, it is clearly perceived as a threshold, and development would extend Tiverton to the east in a way that would compromise the role of the site within the views. Overall a negative effect for wildlife and biodiversity.			
B) Protection and	The site lies in an area of archaeological potential with the HER	-2/?	The policy requires a public	-2/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
promotion of a quality built and historic environment	recording prehistoric activity here and recent archaeological work has identified prehistoric activity across the wider landscape. A small part of the border is next to residential development and there are farm buildings within the site. The level of development proposed will be significant and therefore would likely impact the built and historic environment. However as there are no protected built or historic assets in or around the site the impact on this objective will be minor. Archaeological investigations should be completed to support any planning application for development here however this is not currently required by the policy. The easternmost part of the Blundell's Conservation Area meets the site where the Railway Walk ends. The development would also be adjacent to the Grand Western Canal Conservation area on the southern and eastern boundaries. Design of the development would need to consider the impact on the conservation area. In combination with the Tiverton Eastern Urban Extension (which is already allocated) development at Hartnoll Farm would represent a significant lengthening of Tiverton in an easterly direction along the valley floor. Two issues emerge; firstly as development extends ever easterly, the distance from town centre services increases as well as reliance on the private car and secondly the town will significantly close the gap between its urban areas with nearby villages such as Halberton, which currently has its own separate identity. The coalescence of Halberton is considered a negative effect that can't be mitigated against.		Masterplanning exercise to be undertaken before any planning application is made and which will improve the quality of the final design of the development. Archaeological investigation and appropriate mitigation to enhance sustainability. Coalescence of Tiverton with Halberton is not able to be mitigated satisfactorily, remaining a negative effect after mitigation.	
C) Mitigating the effects of climate change	By focusing new development in settlements where jobs and services are located the option will reduce the need to travel and therefore reduce greenhouse gas emissions. The entire site is in a low risk area (flood zone 1) being the area of least flood risk. Evidence in the SFRA suggests that the site may have some residual flood risk from the Grand	-1/?	The policy should be read in the context of other policies in the plan which aim to mitigate the effects of climate change and reduce the risk of flooding. A Flood Risk Assessment would be	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Western Canal or Wimbleball Reservoir. There is also an unnamed watercourses flowing through site, the impact of which is not yet known. Transport provision to ensure appropriate accessibility for all modes is also supported by the policy and traffic through Halberton and Sampford Peverell is discouraged. There are no existing services, infrastructure or facilities within the site or in close proximity. Given the scale of the development at this site it is likely some negative impacts will occur with regard to carbon emissions through construction and increased traffic movement.		required to determine the impact of the unnamed watercourse. If development avoided areas of flood risk this would mitigate any impact. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. A buffer zone will need to be incorporated around the Grand Western Canal to enable access for maintenance and repair, should it be required. This buffer strip should be within open public space and not within private gardens. If mitigation is provided for, a neutral effect is considered. Uncertainty remains as the impact of the unnamed watercourse is not yet known.	
D) Safeguarding and minimising resource use	The majority of the site 68.7ha (71%) to the NE of the site is Grade 1 agricultural land. It is likely that this site will have a negative impact on this objective due to the scale of development of a site that is predominantly Grade 1 agricultural greenfield land which would be lost if this site is developed. The site will therefore have a significant	-3		-3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	negative impact on this objective.			
E) Promoting economic growth and employment	There are existing employment units on this site which could be retained. The policy option does not propose employment development on this site, a slight negative impact. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. The site is located near to the Strategic Road Network and development here would increase the vitality and viability of Tiverton town centre. There would therefore be some positive impact.	+2		+2
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+2		+2
G) Meeting housing needs	The site allocation will provide for 1,100 dwellings which will include 28% affordable housing subject to further assessment of viability. The site therefore will have a significant positive impact on meeting housing needs for the district.	+3		+3
H) Ensuring community health and wellbeing	Option will contribute towards light and noise pollution, a slight negative effect. The policy does not mention the provision of open space, sport or recreation or the reduction of crime a slight negative impact. The proximity of the site to Tiverton town centre could encourage cycling, walking and the use of public transport. Overall a slight negative impact is considered..	-1	The option promotes the delivery of community facilities to meet local needs arising and transport provision to ensure appropriate accessibility for all modes. The site allocation makes note of carbon reduction and air quality improvements which will help minimise pollution and benefit community health and wellbeing.	+1
I) Delivering the necessary infrastructure	The policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements before this site is developed.	-2	The policy for this site requires a public Masterplanning exercise to be undertaken before any planning application is made. The site is	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Initial work from the Tiverton Eastern Urban Extension suggest that one of the only viable solutions to transport concerns for further development to the East of Tiverton is a link road through the Blundells School site, This option is currently not considered viable. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Places are mostly needed at the Tiverton EUE, which is the largest area of development by far. The masterplan for the area and forthcoming developments include the provision of a school site that can accommodate up to 420 pupils, which should be sufficient to meet the demand in Tiverton. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given pressures on education and highways capacity a negative effect is anticipated.		therefore likely to deliver the necessary infrastructure for the site with the potential to also benefit the surrounding community. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The potential cumulative impact of the development of this site on traffic, pressure on local services and facilities and the current provision of infrastructure should be mitigated by the policy criteria. Overall the development of this site will help meet the housing and commercial needs of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time of the site is approximately 10+ years. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help provide housing for the district. Development would be focussed as an extension to the biggest town in the district.

Blundell's School, Tiverton
Option

A site of 13.2 hectares north of Blundells School could be allocated for mixed use development, subject to; 60 dwellings (28% affordable), 7,000 square metres B1 or other suitable employment floorspace, 8 hectares of informal green infrastructure, land shaping to raise areas for development above flood zone 3, provision of a junction on Heathcoat Way, provision and enhancement of cycle and pedestrian links in the area, site contamination assessment, provision of Sustainable Urban Drainage (SUD) and implementation of transport plans.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site is located within the settlement of Tiverton. There is minimal impact on landscape character and development could improve the current site which comprises of a number of elements including a scrap yard and former poultry handling factory. The Council will review existing species or habitats information held on previously allocated sites.	+2		+2
B) Protection and promotion of a quality built and historic environment	The site lies in an area of archaeological potential with regard to known prehistoric activity in the wider landscape. The southern boundary of the site is adjacent the Blundell's Conservation Area and development would need to have consideration of the conservation area with regard to design. Development on this site has the potential to have a minor negative impact in contributing towards achieving this objective.	-1/?	The policy requires a public Masterplanning exercise to be undertaken before any planning application is made and which will improve the quality of the final design of the development. Archaeological investigation and appropriate mitigation to enhance sustainability.	0/?
C) Mitigating the effects of climate change	The majority of the site is in flood zone 3 (62%). The policy requires land shaping to raise areas for development above flood zone 3, including an allowance for climate change, and to create additional floodplain to compensate for the loss of floodplain. However, as 62% is within the flood plain, suggested land raising is not a feasible mitigation option. As	-3	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	the site is proposed partly for residential and partly commercial development a number of uses could be classed as 'less vulnerable' development and would therefore be compatible with Flood Zones 1, 2 and 3a. The remaining part of the site is proposed for residential development, classed as 'more vulnerable' and would be compatible with flood zone 1 & 2, with an exception test required for flood zone 3a. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir, and surface water run-off may result from development. Overall a significant negative effect is considered.		run-off and arrangements for future maintenance. Development should be focussed in areas of least flood risk first and ensure any development in flood zone 2 and 3a are compatible with these flood zones. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. The SFRA suggests that some forms of mitigation measures, such as land shaping would not be feasible in this location. If mitigation measures are provided there may still be a negative impact.	
D) Safeguarding and minimising resource use	0.7ha is contaminated land (food processing). This site is comprised of brownfield and grade 4 greenfield land. The development of this site would result in both a positive and negative impact but on balance an overall negative score reflecting contaminated land.	-2	The policy requires a site contamination assessment and remediation to mitigate risks associated with the former and current land uses.	-1
E) Promoting economic growth	The development of this site would results in the loss of vacant industrial land. However the allocation includes 7000 sqm of B1 or other employment uses resulting in a balanced score. Development of	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
and employment	this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.			
F) Supporting retail	This site would add to housing in a town, close to the town centre. The allocation includes 7,000 sqm of commercial land. There is potential for this site to support retail in Tiverton.	+2		+2
G) Meeting housing needs	The site allocation will provide for 60 dwellings which will include 28% affordable housing. The site therefore will have a significant positive impact on meeting housing needs for the district.	+2		+2
H) Ensuring community health and wellbeing	The site option requires the provision and enhancement of cycle and pedestrian links in the area. Option will contribute towards light and noise pollution, a slight negative effect. The site is also close to the town centre of Tiverton and therefore is likely to be within walking distance to services. The development of this site is therefore likely to have a minor positive impact on this objective.	+1	The option policy requires the remediation of contaminated land. It also requires the implementation of transport plans and other transport measures to minimise carbon footprint and air quality impacts.	+1
I) Delivering the necessary infrastructure	The policy requires land shaping to raise areas for development above flood zone 3 and the provision of a junction on Heathcoat Way and road access through the site to form part of a link road with the Eastern Urban Extension (depending on whether the urban extension is enlarged by virtue of Policy TIV2, Hartnoll Farm option). The option is likely to deliver the necessary infrastructure for the site. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging local Plan Review. Developer contributions will be required in order to fund these improvements. Given the small scale of	-2	The option for this site requires a public Masterplanning exercise to be undertaken before any planning application is made. The site is therefore likely to deliver the necessary infrastructure for the site with the potential to also benefit the surrounding community. The policy option requires the provision and enhancement of cycle and pedestrian links in the area. The option also requires implementation of transport plans	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	development it is anticipated that this development will not as an individual site put pressure on the local secondary schools. Given pressures on education and highways capacity a negative effect is anticipated.		and other transport measures to minimise carbon footprint and air quality impacts. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The potential cumulative impact of the development of this site on traffic, pressure on local services and facilities and the current provision of infrastructure should be mitigated by the policy criteria. Overall the development of this site will help meet the housing and commercial needs of Tiverton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time of the site is approximately 2-4 years. The scrapyard is only available if an alternative site can be found in the near vicinity.
Spatial extent: (District wide / local)	This site option will help provide housing and employment for Tiverton. Development would be focussed in Tiverton, the largest town in the district.

Hay Park, Tiverton

Option

A site of 0.33 hectares at Hay Park, Canal Hill is proposed for residential development, subject to; 10 dwellings, Sustainable Urban Drainage (SUD), archaeological investigation and protection of local heritage assets. Access to be gained from Canal Hill

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site does contain some mature trees. Development on this site would have minimal landscape impact as it is within the built up area of Tiverton, a neutral effect.	0		0
B) Protection and promotion of a quality built and historic environment	This proposed development area occupies the former settlement of Haypark, first documented in the late 17th century. The site is now occupied with modern housing and any development here may expose archaeological and artefactual deposits associated with this settlement. Access is possible from both Canal Hill and Rennie Road however the access from Canal Hill may require demolition of the barns to provide adequate visibility splays and necessary footpath widths. A negative impact. The retention of the character of the existing buildings would be preferable as they are of historic significance. There is a potential negative impact on the character of the area given archaeological deposits and loss of historic barns.	-2/?	Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, and mitigation measures to protect local heritage assets. The potential loss of historic barns would still warrant a minor negative effect.	-1/?
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk, a neutral effect. There is an unnamed water course flowing though the site for which flood zone information is not available. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir. Surface water run-off may increase flood risk. Overall a negative effect.	-2/?	The option requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. Due to the size of the site, mitigation costs through surface water management may prohibit	-1/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			development, a minor negative effect. Uncertainty remains as the impact of the unnamed watercourse is not yet known.	
D) Safeguarding and minimising resource use	Development option is located on greenfield land which has no agricultural grade, a slight negative and unknown effect.	-1/?		-1/?
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1		+1
G) Meeting housing needs	Option provides for 10 new dwellings a contribution towards future housing need, a slight positive effect.	+1		+1
H) Ensuring community health and wellbeing	Option is not located within walking distance to the town centre a slight negative effect. There are bus stops located along Canal Hill and there are shops located close by. There are no cycle paths, but there is a pedestrian footpath into Tiverton Town Centre. The development option received one letter of support during the options consultation. Overall a minor negative effect is considered.	-1		-1
I) Delivering the necessary infrastructure	The topography of the site would be a constraint to development as would access. Access is possible from both Canal Hill and Rennie Road however the access from Canal Hill may require demolition of the barns to provide adequate visibility splays and necessary footpath widths.	-2	The policy option states that access should be gained from Canal Hill. Policy S8 also provides mitigation by setting out that developers will	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	The retention of the character of the existing buildings would be preferable. The steps to the east would also need to be brought up to standard. The topography of the site would make a sole access from Rennie Road challenging, as a car park area would need to be provided, as it is too steep to go from the top half to bottom half. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given the small scale of development it is anticipated that this development will not as an individual site put pressure on the local secondary schools. Given pressures on education and highways capacity a negative effect is anticipated.		be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The impact of developing this site is expected to be minimal. The development overall will help add to meeting the housing needs of Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time of the site is approximately 1-2 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

The Avenue, Tiverton
Option

A site of 0.4 hectares at The Avenue is allocated for residential development, subject to; 15 dwellings (28% affordable), pavement along the southern boundary and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The impact on the surrounding landscape would be minimal as the site is surrounded by residential development, a neutral effect.	0		0
B) Protection and promotion of a quality built and historic environment	No impact.	0		0
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest level of flood risk, a neutral effect. The site could contribute to surface water run off without appropriate mitigation measures. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir, overall a negative effect is considered.	-2	The policy option requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance. Where the site is adjacent to the Grand Western Canal, a buffer zone to allow access for maintenance will be required. This buffer zone should be within public open space and not within private gardens. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			Western Canal or Wimbleball Reservoir. If mitigation measures are incorporated a neutral effect is considered.	
D) Safeguarding and minimising resource use	Development option is located on brownfield land, a positive effect.	+2		+2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1		+1
G) Meeting housing needs	Option provides for 15 new dwellings including affordable housing a contribution towards future housing need, a slightly positive effect.	+1		+1
H) Ensuring community health and wellbeing	The site is within walking distance of the town centre but up a steep gradient. There is a bus stop on Canal Hill within walking distance.	+1	Criteria within the policy seek provision of pavement along the southern boundary of the site, a slight positive effect.	+1
I) Delivering the necessary infrastructure	The site is located on a poor junction of Canal Hill and The Avenue with poor visibility. It is located on a steep hill and there is no pedestrian access. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will	-2	The policy option requires the provision of a pavement along the southern boundary of the site. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given the small scale of development it is anticipated that this development will not as an individual site put pressure on the local secondary schools. Given pressures on education and highways capacity a negative effect is anticipated.		facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The impact of developing this site is expected to be minimal. The development overall will help add to meeting the housing needs of Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. An estimated development time has not been stated by the proposer and is therefore unknown.
Spatial extent: (District wide / local)	This site option will help provide housing for Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Exeter Hill, Tiverton

Option

A site of 6.09 hectares at Exeter Hill could be allocated for residential development subject to; 55 dwellings (28% affordable), access from Devonshire Rise, a suitable secondary point of access and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site is bounded by hedges and trees and there are wide views across Tiverton and to the ridges to the north. This site falls within the 'River valley slopes and coombes' landscape character area. This area typically falls within the River Exe valley and often has steep, wooded sides and a strong sense of enclosure within a lush valley landscape. Development on this site would extend the built form of	-2	Design which minimises impact to the landscape character. Although there is still an anticipated negative effect.	-2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Tiverton further up this hillside. The site is steeply sloping, with large views of Tiverton and would be highly visible from town. The site is currently open and tranquil, and has views to the north, east and west and there would be a landscape impact of locating housing within this area. Although the level of development is relatively low this would result in a negative effect on this objective due to the context of the site.			
B) Protection and promotion of a quality built and historic environment	Archaeological work here has identified the presence of earthwork features across this site that may be indicative of archaeological activity. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required, a slight negative effect.	-1/?	Archaeological investigation and appropriate mitigation to enhance sustainability.	0/?
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk. The site could contribute to surface water run off without appropriate mitigation measures. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir, overall a negative effect.	-2	The policy option requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. If mitigation measures are provided for a neutral effect is considered.	0
D) Safeguarding	3.4ha (68% South) of the site is located on Grade 3 good / moderate	-1/?		-1/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
and minimising resource use	quality agricultural land and 1.6ha (32% North is located on unclassified agricultural grade, an overall slight negative and unknown effect.			
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1		+1
G) Meeting housing needs	Option provides for 55 new dwellings including 28% of affordable housing a contribution towards future housing need, a positive effect.	+2		+2
H) Ensuring community health and wellbeing	Tiverton town centre lies in reasonably close proximity and a bus service is available on Canal Hill but there is no footway on Exeter Hill which is very steep. Overall this is a neutral impact.	0		0
I) Delivering the necessary infrastructure	The Highway Authority feel that there are difficulties to access the site due to the substandard nature of the junction with Canal hill and the gradient and topography of the site as well as lack of footways to Tiverton. The Highway Authority note potential opportunities to access the site with the area however the area itself is nearing capacity. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given the small scale of development it is anticipated	-2	The policy option requires access from Devonshire rise and a suitable secondary point of access. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	that this development will not as an individual site put pressure on the local secondary schools. Given pressures on education and highways capacity a negative effect is anticipated.			

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time for this site is 2 year. A developer has applied to build on the site although for a lower number of houses; nevertheless the timescale of this development is likely to be short. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Leat Street, Tiverton

Option

A site of 0.2 hectares at 29-31 Leat Street could be allocated for residential development subject to; 8 dwellings, improvements to access onto Leat Street, investigation of increased flood risk, archaeological interest and site contamination, design which respects and enhances the character of the Conservation Area and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site falls within the centre of Tiverton and there will be no impact on landscape character, neutral effect.	0		0
B) Protection and promotion of a	The site is located within the Tiverton Conservation Area, however the policy option requires design which respects and enhances the character of the Conservation area. This site also lies within the historic core of the	-1/?	The policy option requires the investigation of archaeological interest with mitigation as	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
quality built and historic environment	town and in an area shown by historic maps to have been occupied by Sewards Court. These buildings appear to have been demolished sometime in the late 20th century. Any development here has the potential to expose archaeological and artefactual deposits associated with these dwellings. Overall development of this site would have a minor negative effect on this sustainability objective.		appropriate. Development would also need to be designed with the conservation area in mind.	
C) Mitigating the effects of climate change	The site is located mainly in Flood zone 2, with a small part of the site being in Flood Zone 3, a risk of flooding a negative effect. The site is proposed for residential development 'more vulnerable' and would be compatible with flood zone 1 & 2 an exception test is required for flood zone 3a. Development would potentiall increase surface water run-off, a negative impact. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir. Overall a negative effect is considered.	-3	The policy option requires the investigation of increased flood risk with mitigation as appropriate. The policy option also requires the provision of a sustainable urban drainage scheme to deal with all surface water from the development and arrangements for future maintenance. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. If mitigation measures are provided for a slight negative impact would still be considered.	-1
D) Safeguarding and minimising resource use	Development option is located on brownfield land. Potential for contaminated land at the site although an enhanced pollution survey (dating back to 1999) stated the site was free of contamination, a slight negative impact. As this option is on brownfield land and could improve	+1	The policy option requires the investigation of site contamination with mitigation as appropriate.	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	potentially contaminated land, a slight positive effect is felt.			
E) Promoting economic growth and employment	The garage towards the back of the site is currently in use, while the showroom and forecourt are currently vacant. Development of the site will result in the loss of employment land, a negative effect.	-2		-2
F) Supporting retail	The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a minor positive effect.	+1		+1
G) Meeting housing needs	Option provides for 8 new dwellings, a contribution towards future housing need, a slight positive effect.	+1		+1
H) Ensuring community health and wellbeing	Tiverton town centre lies in reasonably close proximity and there are footpaths along both sides of Leat Street as well as on-road cycle links, a slight positive effect.	+1		+1
I) Delivering the necessary infrastructure	There is an existing access directly onto Leat Street. The Mid Devon Community Infrastructure Evidence Report indicates that there are six primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given the small scale of development it is anticipated that this development will not as an individual site put pressure on the local secondary schools. Given pressures on education a slight negative effect is anticipated.	-1	The policy option requires improvement to the access onto Leat Street, a positive effect. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	+1

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs in Tiverton including affordable housing.
Temporary/permanent effects: Timescale: Short (1-5 years),	Within the short term, construction traffic associated with the development will

Medium (6-15 years) Long (15+ years)	contribute towards traffic increase within the town. The estimated development time for this site is 1 year. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Tiverton including for affordable housing. Development would be focussed in Tiverton, the largest town in the district.

Land at Bampton Street / William Street Car Park, Tiverton

Option

A site of 1 hectare at William Street could be allocated for redevelopment as a high quality shopping, leisure and residential area; including 60 dwellings with 28% affordable housing and 9,300 square metres of mixed commercial floorspace. Relocation of New Hall and Constitutional Club, design that respects and enhances the character and appearance of the Conservation Area and retention of public car park and adequate parking service areas to serve the needs of existing and proposed uses.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This is a town centre site located within an existing built up area, with no anticipated impact on landscape character, a neutral effect.	0		0
B) Protection and promotion of a quality built and historic environment	The site is located in the conservation area and is adjacent to a number of listed buildings. On balance development of this site may have a minor negative impact as although the Conservation Area is protected in policy, there is no similar clause to protect the listed buildings in the vicinity.	-1	The policy option requires design that respects and enhances the character and appearance of the Conservation Area.	0
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest level of flood risk, a neutral effect. Evidence in the SFRA suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir. Development may cause surface water run-off flood risk, a negative impact. Overall a negative effect.	-2	Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. If this is incorporated a	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			neutral effect is considered.	
D) Safeguarding and minimising resource use	This site is located on brownfield land, a positive effect.	+2		+2
E) Promoting economic growth and employment	Development of this site may result in the loss of some employment space however the policy provides for 9,300 square metres of mixed commercial floorspace including retail, office and leisure uses. On balance this would have a significant positive effect on this sustainability objective through the provision of employment space and enhancement of the site.	+3		+3
F) Supporting retail	The site is located within the town centre therefore helping to enhance the vitality and viability of the town centre, a significant positive effect.	+3		+3
G) Meeting housing needs	The policy option requires 60 dwellings including 28% affordable housing. This helps to meet the housing needs of Tiverton including affordable housing, a positive effect.	+2		+2
H) Ensuring community health and wellbeing	The site is within the town centre and close to existing bus service provision and a wide range of service. Development of the site could result in the loss of the 'New Hall' and Constitutional Club, the policy option requires the appropriate relocation of New Hall and Constitutional Club. Development of the site would also result in the loss of the Post Office Depot. Overall due to the close relationship of the development to service and facilities but the potential loss of the Post Office Depot the development of the site would have a minor positive impact on this sustainability objective.	+1	Option should require the relocation of the Post Office depot.	+2
I) Delivering the necessary	Part of the site is currently used as a public car park. The Mid Devon Community Infrastructure Evidence Report indicates that there are six	-1	The policy option requires the retention of a public car park and	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
infrastructure	primary schools located within Tiverton itself and these are largely accepting more students than their planned admission number. The development allocations will result in a need to provide additional primary education facilities. Additional secondary places will be required to accommodate the development proposed to be allocated in the emerging Local Plan Review. Developer contributions will be required in order to fund these improvements. Given the small scale of development it is anticipated that this development will not as an individual site put pressure on the local secondary schools. Given pressures on education a slight negative effect is anticipated.		adequate parking and service areas to serve the needs of existing and proposed uses. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The development will help meet the housing needs including affordable housing in Tiverton. The development also adds to mixed commercial floorspace which will enhance Tiverton town centre, the largest town in the district.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	During construction there may be some short term temporary interruptions to some services. The estimated development time for this site currently unknown. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing including affordable housing within Tiverton. Development would be focussed in Tiverton, the largest town in the district. Development of the town centre has the potential to benefit the surrounding area of Tiverton who use Tiverton town centre for shopping and retail.

Land at the Foundry, Tiverton

Option

A site of 1.7 hectare at Land at the Foundry is allocated for commercial development, subject to 6,800 square metres of mixed commercial floorspace, retail impact assessment, flood risk assessment, site contamination assessment and transport assessment with measures to minimise carbon emissions.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site lies within the historic core of Tiverton, and just to the east of the putative Saxon core of the settlement. Limited landscape impact is anticipated, as the site is within the settlement, a neutral effect.	0		0
B) Protection and promotion of a quality built and historic environment	The site lies within the historic core of Tiverton, and just to the east of the putative Saxon core of the settlement.	0/?	Any consent granted for development here should be conditional upon a programme of archaeological work being implemented in mitigation for the impact of any development upon the heritage assets of the site.	0/?
C) Mitigating the effects of climate change	A Main River is on the site boundary. Any alterations or works within the river must be discussed with the Environment Agency and Flood Defence Consent requested and approved where necessary. Flood Zone 3 is within the site boundary. The National Planning Policy Framework must be adhered and the sequential and exception tests used where necessary. Any planning application must be accompanied by a flood risk assessment. As the site is proposed for commercial development a number of uses could be classed as 'less vulnerable' development and would therefore be compatible with Flood Zones 1, 2 and 3a. However, given the site is 100% in Flood zone 3a, the proximity of the River Lowman and that 100% of the site has flooded in the past there is a high possibility that this site lies within Flood Zone 3b. Development may increase the surface water run-off of the site, a negative impact. Evidence in the SFRA also suggests that the site may also have some residual flood risk from the Grand Western Canal or Wimbleball Reservoir, overall a significant negative effect and uncertain effect is	-3/?	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Development should be focussed in areas of least flood risk first and ensure any development in flood zone 2 and 3a are compatible with these flood zones. Appropriate mitigation measures should be incorporated into the design of development to respond to the flood risk from the Grand Western Canal or Wimbleball Reservoir. However	-3/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	considered as the extent of Flood Zone 3b is unknown.		even with mitigation measures there's a high possibility that this site lies within Flood Zone 3b, therefore a significant negative effect remains, although this is uncertain.	
D) Safeguarding and minimising resource use	This site is located on brownfield land a positive effect. Parts of the site include contaminated land a negative effect. On balance a slight positive effect is considered	+1	Criteria require site contamination assessment and remediation if appropriate.	+2
E) Promoting economic growth and employment	This site is an existing employment site adjoining the Tesco store on the edge of Tiverton town centre. There is a mix of uses on the site, including sawmill equipment manufacturing, machinery and repair supplies distribution, bare land storage of scaffolding and building materials, and temporary office accommodation for a building contractor. Redevelopment of the site would enable more efficient use of the land and introduce retail use in an accessible edge-of-centre location. Potential issue of competition with town centre uses, but no concerns about employment uses in this area in principle. Development of this site may result in the loss of some employment space however the policy provides for 6,800 square metres of mixed commercial floorspace within use classes B1-B8 and non-food A1. On balance this would have a significant positive effect on this sustainability objective through the provision of employment space and enhancement of the site.	+2		+2
F) Supporting retail	Potential issue of competition with town centre uses, a slight negative effect.	-1	Criteria within the policy require a retail impact assessment to demonstrate that the proposal will have no adverse effect on the	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			vitality and viability of Tiverton town centre, a minor positive effect.	
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0		0
H) Ensuring community health and wellbeing	This is an edge of town centre location where there is a wide range of services. The site is adjacent to improved services on Blundells Road. Development and intensification of the site could lead to increased carbon emissions and air quality issues, a slight negative effect.	-1	Provision of a transport assessment and travel plan with measures to minimise carbon emissions and air quality impacts.	0
I) Delivering the necessary infrastructure	The Highway Authority has no objections in principle and any development of the site will need to be accompanied by a Transport assessment taking into consideration both roundabouts at the entry to the site and its junctions with A396, Station road, Heathcoat way and should be accompanied by travel plans. The requirement for a transport assessment is an uncertain effect.	0/?	Policy requires the provision of a transport assessment. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0/?

Secondary/cumulative/synergistic effects:	The development adds to mixed commercial floorspace which could compete with Tiverton town centre, the largest town in the district.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	During construction there may be some short term temporary interruptions to some services. The estimated development time for this site currently unknown. Once developed, development will be permanent.
Spatial extent: (District wide / local)	Development would be focussed in Tiverton, the largest town in the district. Development has the potential to benefit the surrounding area who use Tiverton for employment and retail uses.

Cullompton Preferred Site Allocations

Policy CU1-6: North West Cullompton

A site of 94 hectares to the North West of Cullompton is allocated for mixed use development subject to; 1,150 dwellings (28% affordable), 5 pitches for gypsies and travellers, extra care housing, 5% of housing to be serviced plots for self-build, 21,000 sqm of commercial floor space including retirement complex, hotel and leisure, 35 hectares of green infrastructure, road linking Tiverton Road to Willand Road, environmental protection, community facilities including primary school, Carbon reduction and air quality improvements, phasing strategy and master planning exercise. Policies CU2-6 provide further detail. For reference, part of the site called 'Growen Farm' in the 2013 SHLAA Report and part of the site known as 'Emmet Land' in the 2014 SHLAA has been incorporated into the North West Cullompton allocation site.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	There are a number of protected trees and hedgerows within the site, along field boundaries. This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The landscape is undulating, with the higher parts more sensitive to change and development. Developing this area will extend the built up area of the town, from an agricultural landscape, which will be a significant change. However, the visibility from elsewhere varies across the site. The more elevated parts of the site (such as St Andrews Hill and Rull Hill) are more sensitive to development because of their visibility in the landscape (particularly on north and west facing slopes). Ecological survey information is not available for this site. The Landscape and Visual Appraisal concludes: Growen Farm will be closely related to future development, although it is currently quite separate from Cullompton, and with exception of land parcel A, more closely related to open countryside. However, there are relatively few publicly accessible viewpoints of the site, and although existing mature vegetation does provide some separation of parcel B from the proposed development to the south, nevertheless the general context would be that development and	-3	The policy requires 'environmental protection and enhancement' which will help mitigate the impact on this objective however the level of development on the site will still have an impact on the character of the area. CU3 sets out these measures in detail including; the protection and strengthening of trees and other features, maintaining wildlife networks, 28 ha of green infrastructure, providing public open space and allotments, strategic landscaping and measures to protect the biodiversity. Overall a neutral effect.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	the limited visibility leads to the conclusion that parcels A and B could be developed, with parcel C as part of the future green infrastructure. Subject to reinforcement of existing boundaries with the objective of integration rather than screening, parcel B could be extended northwards to the next field boundary. The Rull Land site is currently remote from development, and largely separate from proposed development as a large area of proposed green infrastructure lies to the south. The eastern boundary adjoins an area of proposed development. The future context of the site will change to the east. The northern part, parcel B, is part of a shallow valley, whilst the larger part of the site, parcel A, slopes down to the eastern boundary and faces open countryside. As with Gowen Farm, the site is only locally visible from a limited area, but would require significant and substantial reinforcement of the eastern boundary to integrate it into the rural setting. Other parts of the site are relatively contained by the topography and development in these locations would have only a medium impact. Given some higher parts of the site are sensitivity to change and development so overall a significant negative effect is anticipated.			
B) Protection and promotion of a quality built and historic environment	The site adjoins a roman fort on St Andrew's Hill (a scheduled ancient monument). There are a number of listed buildings within the cemetery and farmyards adjoining the site which would need to be considered when designing the development. The site lies in an area of high archaeological potential to the north of the Roman fort at St Andrew's Hill and contains evidence of prehistoric activity identified through aerial photography and findspots of flint tools. Recent archaeological investigations in this area have demonstrated the presence of extensive and significant prehistoric and Romano-British sites.	-2/?	Criteria within the supporting policy CU3 seek mitigation measures through archaeological investigation, a slight negative effect. The policy requires a public Masterplanning exercise to be undertaken before any planning application is made and which will improve the quality of the final design of the development. Overall a slightly negative effect.	-1/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
C) Mitigating the effects of climate change	The site is largely located in Flood zone 1 the lowest risk to flooding. However there are unnamed watercourses flowing through parts of the site for which flood zone information is not yet known. The northern edge is adjacent to flood zone 3a, which is associated with a watercourse which runs west-east, a potentially slight negative impact. The layout of the development will need to take this into account with a potential buffer zone. Areas of floodplain should be retained as part of the strategic green infrastructure. The Flood Map for Surface Water shows a low risk of flooding from surface water in most areas. Any development must be accompanied by a suitable drainage strategy to deal with existing surface water flows and any potential increase in surface runoff a slight negative impact. The site has increased in size, which has led to more of the northern boundary being adjacent to flood zones 2 and 3. Criteria within the policy seek carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, a slight positive effect. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation. Taking into account flood risk and climate change an overall minor negative and uncertain effect is considered.	-1/?	Criteria within the policy seek mitigation measures through environmental protection and enhancement. Built development is entirely in flood zone 1 and CU3 seeks SUDs to deal with surface water run-off. The policy requires carbon reduction and air quality improvements and will help mitigate the effects of climate change. This will help minimise the overall carbon footprint of the development. A Flood Risk Assessment would be required to determine the impact of the unnamed watercourses. If development avoided areas of flood risk this would mitigate any impact. Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. Taking into account flood risk and mitigation measures for climate change an overall slight positive effect is considered.	+1/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			Uncertainty remains as the impact of the unnamed watercourse is not yet known.	
D) Safeguarding and minimising resource use	Development option is located on greenfield land. Approximately 70% of the site is located on Grade 1 agricultural land of the highest quality, with the remainder located on Grade 4, poor quality agricultural land. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of the highest grade agricultural land, a significant negative effect is considered.	-3		-3
E) Promoting economic growth and employment	Policy provides 21,000 sqm of commercial floorspace reflecting the recommendation of the Employment Land Review (2012) helping to diversify the economy and encourage inward investment. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. Providing employment sites near where to people live would provide the opportunity to reduce out-commuting, levels of which are high within the district. There would therefore be a significant positive impact.	+3		+3
F) Supporting retail	The policy contains no specific retail proposals although these proposals could form part of the Commercial allocation. Though the high street and supermarket are not within easy walking distance of all parts of the site, it is still anticipated that they would benefit from the custom of the residents from this development. Therefore a positive impact has been assumed.	+2		+2
G) Meeting housing needs	Option is well related to existing housing development and services forming a logical extension to the north west of Cullompton, a positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. The policy provides for 1,150 new dwellings of which 28% should be affordable and 5 gypsy and traveller sites making a	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	significant contribution towards future housing need, a positive effect. The policy also makes provision for extra care housing and for 5% of housing to be serviced plots for self-build.			
H) Ensuring community health and wellbeing	The option will have an impact on Cullompton Air Quality Management area which will require some mitigation. The existing site allocation for North West Cullompton includes the provision of a road linking Tiverton Road to Willand Road. This, along with delivery of the Town Centre Relief Road, is intended to significantly reduce the amount of traffic in the town centre. This should in turn improve the air quality and town centre vitality (as it would direct traffic away from the high street) and is at the heart of the long term development strategy for Cullompton. The Renewable Energy, Carbon Reduction and Air Quality study (2014) reiterates that North West Cullompton alongside East Cullompton are likely to result in the largest change in local air quality as both developments are large in size. Development in Cullompton will increase pollution concentrations as a result of additional traffic using the local road network; however the existing allocation for a Town Centre relief road linking Station Road and Meadow Lane in particularly important for air quality. There is a medical centre located adjacent to the east side of the northern element of the site and a number of rights of way/bridleways run through the site.	+2	CU5 makes note of carbon reduction and air quality improvements which will help minimise pollution and benefit community health and wellbeing including use of low emission strategies. CU3 makes provision for areas of equipped and laid out public open space including children's play, sports pitches and allotments as well as strategic green infrastructure including park land, open space and local nature reserve. The policy also promotes the delivery of community facilities to meet local needs arising and transport provision to ensure appropriate accessibility for all modes. This suggests that opportunities for sustainable forms of travel may arise.	+2
I) Delivering the necessary infrastructure	The policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements, for example, to M5 J28 before this site is developed. The policy requires masterplanning to take place to ensure that the necessary infrastructure is delivered at a rate to support the	+2	CU6 includes an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. CU3 includes the provision of Green Infrastructure.	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	additional development without placing unacceptable demands on existing capacity. A road link between Tiverton Road and Willand Road will be delivered as part of bringing the site forward, whilst the site will contribute towards the cost of the Town Centre Relief Road, a key element of local infrastructure. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places. Part of the site is close to St. Andrew's Primary School; however the quantum of development will require an additional school to be built to meet identified need. Overall, provision of the necessary infrastructure, which is to be determined by the masterplan, is considered a positive impact arising from the policy.		CU2 sets out agreed transport provision including provision of a network of streets linking to the existing highway network, including a through route suitable for buses linking Tiverton Road to Willand Road; bus enhancements and pedestrian routes. CU4 makes provision for a primary school and contributions towards early years and youth support services. The site is therefore likely to deliver the necessary infrastructure for the site which may also benefit the surrounding community.	

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Additional primary school capacity will be needed to accommodate the developments. This would be most suitably provided through a new 290 school at the North-West Cullompton site and a new primary school or schools providing for around 650 pupils within the East of Cullompton allocation. Additional secondary school capacity will need to be undertaken in consideration of the aspirations

	of the local schools and communities.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time of the site is approximately 15 years. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help provide housing for the district. Development would be focussed as an extension to the second town in the district.

Policy CU7-12: East Cullompton

A site of 160 hectares to the east of Cullompton is allocated for mixed use development, subject to; 2,100 dwellings during the plan period and 500 dwellings post 2033 (28% affordable), extra care housing, 5% to be serviced plots for self-build and at least 10 gypsy and traveller pitches, 20,000 square metres of mixed commercial floor space during the plan period and 12,000 sqm post 2033, 40 ha of green infrastructure comprising mixed open space, sports pitches, allotments and natural habitats, new or improved access and egress onto the M5 motorway and pedestrian and cycle links to the town centre, environmental protection, assessment of land contamination, community facilities, carbon reduction and air quality improvements, phasing strategy and masterplanning. For reference, part of the site called 'Land at East Culm Farm' and the whole of the site called 'Land at Newlands Farm' in the 2013 SHLAA Report have been incorporated into the East Cullompton site. The remainder of the site called 'Land at East Culm Farm' is now called Cummings Nursery and is a separately allocated site.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	There is a 1 ha unclassified wildlife site close to the western edge of the proposed urban extension. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is large and predominantly flat. The landscape of the surrounding area is also largely flat, offering limited views into the site. However, given the scale of the site, and there may well be variations in topography. Fields are of low wildlife value being agriculturally improved grassland/poor semi-improved grassland/arable. The main interest is in the hedgerows, some of which are mature and species rich. They have the potential to support dormouse and bat species. Most of the hedgerows are likely to be considered as "important" under the Hedgerow Regulation Act 1997.	-2	The policy requires 'environmental protection and enhancement' which will help mitigate the impact on this objective however the level of development on the site will have an impact on the character of the area. CU9 sets out these measures in detail including the protection and strengthening of trees and other features, maintaining wildlife networks, providing public open space and allotments, strategic landscaping	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	There are several streams, two small areas of woodland and a few veteran trees which are also of wildlife importance. This site has the potential to support roosting, commuting and foraging bats, otter, dormice and badger, and as such further surveys should be carried out before development is considered any further. Features such as hedgerows, woodland, streams and mature/veteran trees should be retained. DBRC has records of the following key species within 1km of the site: otter, dormouse, badger. Bat species from 2-3km from the site. Unconfirmed Wildlife Site within site boundary was a pond originally designated for Great Crested newts. It is unknown if they are still present. The Phase I habitat survey for the site (Devon Biodiversity Records Centre, June 2014) states: "The site is relatively large and comprises a range of habitat types. Of the habitats present the hedgerows are considered to provide the greatest value for wildlife as they are mature, well connected and species-rich. Furthermore, the woodlands, whilst small are moderately species-rich, and are also well connected in the wider landscape through the hedgerow network. The hedgerows and woodlands add to the structural diversity of the area. If the site is subject to development it is recommended that the hedgerows and woodlands are retained where possible." The Landscape and Visual Appraisal concludes: This site is closely related to existing and proposed development as its eastern end, and quite separate from development as its western end. Part of a large area of gently undulating agricultural land, apart from where the Honiton Road passes through it, it is difficult to perceive the site in the surrounding landscape. Although visible from limited locations in the AONB to the east are and high ground to the north-west of Cullompton, it is difficult to readily perceive the site owing to distance, vegetation and landform. As a result, phased development from the west is acceptable in parcels A and C as far as the strong boundary along the vegetated valley. Beyond the boundary, parcels B and D could be developed in the longer term.		and green infrastructure including park land and open space. Overall a slight negative effect.	

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Although the site is largely flat offering limited views and fields are of a low wildlife value, the scale of the site is still considered to have negative effect to wildlife and biodiversity.			
B) Protection and promotion of a quality built and historic environment	This site occupies a significant area within a landscape that has evidence of prehistoric and Roman activity recorded in the County Historic Environment Record. To the west, recent archaeological work has demonstrated the presence of prehistoric and Roman settlement in and around Cullompton. While no such sites are recorded within the area under consideration (though this may just reflect the absence of any formal archaeological work in this area) the Historic Environment Team would regard, due to the area of the proposed allocation and the known prehistoric and Roman activity in the wider landscape, that there is potential for the site contain archaeological deposits associated with the known prehistoric and Roman activity in the vicinity. The Historic Environment Team would therefore advise that any planning application for the development of this area should be supported by the results of an appropriate programme of archaeological work to allow the archaeological potential of the site to be understood along with the impact of any development upon the heritage assets in the site. This would be in accordance with Local and National Policy on planning and the historic environment. There is the potential for minor negative impacts on heritage until more information is known.	-1/?	The policy requires a public masterplanning exercise to be undertaken before any planning application is made to ensure the quality of the final design of the development, which is considered to be a large positive impact. The adopted masterplan will help to minimise the impact on the built and historic environment through good design. CU7 seeks detailed archaeological investigation and measures to record and protect archaeological interest. Overall a neutral effect.	0/?
C) Mitigating the effects of climate change	10% of site is in flood zone 3, primarily through the centre of the site and in the north west and east of the site. A negative effect. Strategic flood risk assessment (2014) notes that the site is vulnerable to surface water flooding and an unnamed watercourse flows through the site, a negative and unknown impact. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation. The renewable energy, carbon reduction and air quality study (2014) supports the centralisation of development for carbon saving reasons. Taking into account flood risk and climate change an overall significant	-3/?	Criteria within the policy seek mitigation measures through retention of land in the floodplain as informal amenity open space. The policy requires carbon reduction and air quality improvements and will help mitigate the effects of climate change. Policy S11 Cullompton supporting text acknowledges the	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	negative effect is considered given the scale of development.		Critical Drainage Area at Cullompton which provides mitigation. Taking into account flood risk and mitigation measures for climate change an overall neutral effect is considered. Uncertainty remains as the impact of the unnamed watercourse is unknown.	
D) Safeguarding and minimising resource use	Development option is located largely on greenfield land although there are a number of farms within the site and approximately 8.4ha of contaminated land located in the western side of the site. Option would result in the loss of 63.2ha (west) of Grade 1 excellent quality agricultural land, 93ha (east) of grade 3 good to moderate quality agricultural land and 4.3ha (west) Grade 4 poor quality agricultural land, a significant negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of a significant amount of Grade 1 agricultural land an overall significant negative effect is considered.	-3	Although the remediation of contaminated land is a positive effect, the overall loss of Grade 1 agricultural land is still considered a significant negative effect.	-3
E) Promoting economic growth and employment	There are a number of farms on which a small number of B class employment units are situated. These could be incorporated into the site, or replaced with other employment units as part of a mixed use approach for the whole site. The policy seeks the provision of 20,000 square metres of mixed commercial floor space during the plan period and 12,000 sqm post 2033, bringing with it a large number of jobs into the town. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would be a significant positive impact.	+3		+3
F) Supporting retail	The policy seeks the provision of 20,000 square metres of mixed commercial floor space including retail, during the plan period and 12,000 sqm post 2033, bringing with it a large number of jobs into the town. The	+1/?	Criteria in the policy state that this is subject to impact assessment which demonstrates no adverse	+1/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	scale of residential development in this location near to the town centre is considered a slight positive effect for town centre viability. As the percentage of retail within the sites commercial element is uncertain, an unknown is also recorded.		impacts on existing retail uses within Cullompton Town Centre, an overall slight positive effect. An unkown is recorded until the retail impact has been assessed.	
G) Meeting housing needs	Option provides for 2,100 new dwellings during the plan period and 500 dwellings post 2033 of which 28% should be affordable a contribution towards future housing need, a significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. Policy seeks to provide for at least 10 gypsy and traveller sites, extra care housing and serviced plots for 5% self-build. Given the site is of such a scale to generate a critical mass of self-sustaining development and the option significantly contributes towards housing development an overall significant positive effect is considered.	+3		+3
H) Ensuring community health and wellbeing	The site is located some distance from the town centre and remote from Cullompton town services/facilities. Option will contribute towards light and noise pollution, a slight negative effect. The western portion of the site is in very close proximity to the motorway, the noise from which may negatively impact on residential amenity. The Renewable Energy, Carbon Reduction and Air Quality study (2014) reiterates that North West Cullompton alongside East Cullompton are likely to result in the largest change in local air quality as both developments are large in size. Development in Cullompton will increase pollution concentrations as a result of additional traffic using the local road network; however the existing allocation for a Town Centre relief road linking Station Road and Meadow Lane is particularly important for air quality. In balancing the distance of the development from the town centre and the severance caused by the M5 motorway, the lack of services and the corresponding light, noise and air pollution an overall significant negative	-3	CU11 makes note of carbon reduction and air quality improvements which will help minimise pollution and benefit community health and wellbeing. CU9 makes provision for areas of equipped and laid out public open space including children's play, sports pitches and allotments as well as strategic green infrastructure including park land, open space and local nature reserve. Criteria within the policy seek provision of a dedicated pedestrian and cycle route to the town centre. The policy also	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	effect is considered.		promotes the delivery of community facilities to meet local needs arising and transport provision to ensure appropriate accessibility for all modes. This suggests that opportunities for sustainable forms of travel may arise. An overall neutral effect.	
I) Delivering the necessary infrastructure	The policy requires an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. There are potential highway capacity issues around this site which would require enhancements, for example, to M5 J28 before this site is developed. A development in this location and of the size proposed would have significant implications for the operation of J28 and the M5 mainline. The junction already operates at capacity at times with queues on the off-slips extending back onto the M5 mainline. This causes serious road safety concerns. Devon County Council is currently working towards an improvement aimed at accommodating current growth proposals as set out in the Core Strategy. Further improvement would be needed to the junction to accommodate traffic arising from the SHLAA proposal and are very likely to be significant in scale, i.e. a second over bridge. Consideration would also have to be given to the ability of the M5 mainline to accommodate the forecast traffic flows and measures identified, if necessary, to ensure that demand for traffic movements along the M5 remains within the capacity of the mainline to accommodate it. The Highways Agency has reservations about the impact on the strategic road network. The site is of a sufficient scale for infrastructure improvements to be necessary within and outside of the site. Criteria within the policy seek transport provision to ensure appropriate accessibility for all modes, improvements to Junction 28 of the M5 motorway and provision of a dedicated pedestrian and cycle route to the town centre. Given the capacity limitations for junction 28 of the M5;	-3	CU12 includes an agreed phasing strategy to bring forward development and infrastructure in step and retain the overall viability of development. CU9 includes the provision of Green Infrastructure. CU8 sets out agreed transport provision including; Provision of mitigation measures to ensure only acceptable impacts occur to J28 of the M5 as a result of traffic generated from the site; Provision of appropriate highway improvements on roads around the development to ensure any unacceptable traffic impacts are mitigated; Provision of a network of streets linking to the existing highway network, and appropriate mitigation to reduce impacts on the existing road network such as Honiton Road; Sustainable modes of transport are also supported.	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	traffic implications for the Honiton Road and lead in time for delivery of a large urban extension against proposed mitigation measures a significant negative effect is considered until appropriate studies / modelling work can confirm that access can be achieved and suitable junctions designed. The size of the development would also need considerable planning and design works and criteria within the policy seek a phasing strategy and public masterplanning exercise. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places.		CU10 makes provision for a primary school and contributions towards secondary school places. The site is therefore likely to deliver the necessary infrastructure for the site which may also benefit the surrounding community.	

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole. Additional primary school capacity will be needed to accommodate the developments. This would be most suitably provided through a new 290 primary school at the North-West Cullompton site and a new primary school or schools providing for around 650 pupils within the East of Cullompton allocation. Additional secondary school capacity will need to be undertaken in consideration of the aspirations of the local schools and communities. The Renewable Energy, Carbon Reduction and Air Quality study (2014) recognises benefits with locating strategic development within a single location in carbon reduction terms.

Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will occur during the later period of the plan, and then will continue throughout the remaining lifetime, (therefore likely to only be taking place in the long-term). Once developed, the effects will be permanent.
Spatial extent: (District wide / local)	The policy set seek to meet the development needs of the whole district.

Policy CU13: Knowle Lane

A site of 9.8 hectares at Knowle Lane is allocated for residential development, subject to; 315 dwellings (35% affordable), Green Infrastructure, environmental improvements, transport provision and two points of vehicular access, pedestrian links and air quality improvements and travel plans with SUDS features and linking pipe work is integrated and phased appropriately.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site is in close proximity to a number of protected trees (in the adjoining north eastern field). This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site can be viewed from Knowle Lane (to the south) and Ponsford Lane to the north. The land rises to the west, though there are few public viewing points. Housing to the east would provide a level of mitigation, though does extend the built environment into the countryside. Overall, the site is relatively well contained within the landscape, and impacts are not likely to be significant.	-1	Criteria have been included within the policy to seek measures to protect and strengthen trees, hedgerows and other environmental features which contribute to the character and biodiversity, maintaining a wildlife network within the site and linking to the surrounding countryside. Overall, the mitigation measures will reduce much of the impact, and therefore only a neutral impact has been assumed.	0
B) Protection and promotion of a quality built and historic environment	The site lies to the west of the Roman fort (a Scheduled Monument) and to the south of a possible road leading west from the fort. A geophysical survey undertaken in support of a planning application for this area identified anomalies within the proposed development site that may represent archaeological features, some of which may be indicative of industrial activity. In the light of the results of the geophysical survey and the presence of prehistoric as well as 18/19th century industrial activity	-1	Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	recorded to the east in the adjacent development site, any groundworks associated with the development of this area have the potential to expose and destroy archaeological deposits associated with the known archaeological activity in the vicinity. Given the recent findings above a slight negative effect is considered.			
C) Mitigating the effects of climate change	The north and south of the site lies within Flood zone 1 with an unnamed watercourse flowing across the entire site from east to west is within Flood zone 2 and 3. The site is therefore largely outside the highest areas of flood risk although a portion does fall within flood zones 2 & 3. Given part of the site is located in flood zones 2 & 3 and contribution towards carbon emissions a negative effect is thought. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation. Development may also increase surface water run-off and this would need mitigation, a further negative impact.	-3	Criteria within the policy however seek retention of land in the floodplain as informal amenity open space. Criteria within the policy require SUDS features and linking pipe work that is integrated and phased appropriately. Criteria within the policy seek transport plans, carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, which overall should address potential negative impacts. Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. Taking into account flood risk and mitigation measures for climate change an overall neutral impact is considered. Overall a neutral effect.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
D) Safeguarding and minimising resource use	Development option is located on greenfield land, which would be lost if this site is developed. 3.3ha (27% N and S) of the site is located on Grade 1 high quality agricultural land and 9ha (73% central strip of site running east to west) of the site is located on Grade 4 poor quality agricultural land. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. The loss of any grade 1 land is considered to be a negative effect, given its scarcity in the district.	-2		-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect. Development of this scale may be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1		+1
F) Supporting retail	Option is located within walking distance to the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a positive effect.	+2		+2
G) Meeting housing needs	Option is well related to the existing built form at Cullompton, a positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. The option provides for 340 new dwellings of which 35% should be affordable a contribution towards future housing need, a significant positive effect.	+3		+3
H) Ensuring community health and wellbeing	Development at this site will have an impact on Cullompton Air Quality Management area, and could contribute towards noise and light pollution. Renewable Energy, Carbon Reduction and Air Quality Study (2014) notes one of the options in Cullompton, Knowle Lane has a resolution to grant planning permission and an air quality assessment has been undertaken for the site. This assessed the development of 285 dwellings, slightly less than that considered in the Local Plan Review, and concluded that the development would have a negligible effect on local air quality both within and outside the AQMA. However, mitigation measures have been proposed within the policy which should address some of these concerns. Overall,	0	Criteria with the policy seek the provision of 2.7 hectares of Green Infrastructure, to include the retention of land in the floodplain as informal amenity open space; as well as provision of appropriate links to the adjacent development to the east of the site, as well as implementation of a transport plan and other measures to minimise	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	given the positive impacts of providing green infrastructure and public open space, and the potential negative impacts of other effects, a neutral score has been assumed. During the options consultation the site option received two letters of support and no objections.		carbon and air quality impacts, a slight positive effect.	
I) Delivering the necessary infrastructure	The site may impact on the capacity of J28 of the M5. However, the Highways Agency has lifted their holding direction on already allocated sites within Cullompton now that improvements works to the junction have now been agreed with Devon County Council. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places. Primary schools are at capacity and are both located on constrained sites making expansion either difficult or proportionally expensive. New school provision will be required early in the development.	-2	Criteria within the policy seek at least two access points to the site from adjoining development not from Ponsford Lane, a slightly positive effect on the local road network. The policy requires appropriate links to adjoining development, and the provision of cycle and pedestrian links. A slight positive impact. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities. Overall, the policy ensures sufficient level of infrastructure is upgraded to account for the site.	+1

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Additional primary school capacity will be needed to accommodate the developments. This would be most suitably provided through a new 420 school at the North-West Cullompton site and a new school or schools providing for

	around 650 pupils within the East of Cullompton allocation. Additional secondary school capacity will need to be undertaken in consideration of the aspirations of the local schools and communities.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time of the site is approximately 5 years. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help provide housing for Cullompton. Development would be focussed as an extension to the second town in the district.

Policy CU14: Ware Park and Footlands

A site of 2.1 hectares at Ware Park and Footlands could be allocated for residential development, subject to; 38 dwellings (28% affordable), completion of the NW Cullompton link road, implementation of M5 improvements, archaeological investigation, access from the Knowle Lane development, transport assessment and air quality improvements.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is flat, and bounded by established hedgerows. These screen the site from views from the south, whilst the adjacent site to be developed at the north will mitigate views from the north. Given these factors it is not considered that there will be a very limited landscape and visual impact. At this stage, the Council is not aware of the presence of protected species or habitats. Overall, a neutral impact is considered.	0		0
B) Protection and promotion of a quality built and historic environment	A geophysical survey undertaken in support of a planning application for this area identified anomalies within the proposed development site that may represent archaeological features, some of which may be indicative of industrial activity. In the light of the results of the geophysical survey and the presence of prehistoric as well as 18/19th century industrial activity recorded to the east in the adjacent development site, any groundworks associated with the development of this area have the potential to expose	-1/?	Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required.	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	and destroy archaeological deposits associated with the known archaeological activity in the vicinity. Until further investigation provides more information, a slight negative effect must be assumed.			
C) Mitigating the effects of climate change	The south of the site is located in flood zone 1 which has the lowest probability of flooding. However, an unnamed stream runs to the north and a small portion of the northern part of the site is within Flood zone 3a. The impact may need to be considered via a flood risk assessment. A flood risk assessment will also have to determine the specific recommendations for mitigation for the Critical Drainage Area which is identified at Cullopton. A slight negative effect is thought. Development may result in increased surface water run-off which would need to be mitigated, a negative impact.	-2	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. Overall, a neutral effect is considered.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. The option would result in the loss of a small area of 0.7ha (33% SE) grade 1 high quality agricultural land and 1.4ha (67% NW) Grade 4 poor quality agricultural land, a slight negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district, hence the overall negative score.	-2		-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street could benefit from the custom of the residents from this development. There would be a slight positive effect.	+1		+1
G) Meeting housing needs	Option is not well related to the current built extent of the town though it would form a natural extension to the Knowle Lane site. The option	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	provides for 38 new dwellings of which 28% should be affordable a contribution towards future housing need, a positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. Given the contribution to housing need an overall a positive effect is considered.			
H) Ensuring community health and wellbeing	Site option does not result in the loss or gain of community facilities or open space, a neutral effect. There could be an impact on Cullompton Air Quality Management area which will require some mitigation. The option will contribute towards light and noise pollution, a slight negative effect. Given this is a small site, a slight negative impact has been assumed.	-1	The policy requires the implementation of a transport plan and measures to mitigate air quality impacts.	0
I) Delivering the necessary infrastructure	Development of this site would depend upon delivery of the existing Knowle Lane allocation. Knowle Lane itself, by reason of its width and alignment, is unsuitable to accommodate addition traffic, but if the existing allocated site is developed first then access will be sought through that site, given the limitations of Tiverton Road. A requirement for a transport assessment is an uncertain effect. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places. Overall, therefore, the impact on infrastructure is considered to be slightly negative.	-1/?	Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0/?

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options

	in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Additional primary school capacity will be needed to accommodate the developments. This would be most suitably provided through a new 420 school at the North-West Cullompton site and a new school or schools providing for around 650 pupils within the East of Cullompton allocation. Additional secondary school capacity will need to be undertaken in consideration of the aspirations of the local schools and communities.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The site is only likely to come forward once Knowle Lane is built out, the impact is likely to be medium-long term. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide the housing within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Policy CU15: Land at Exeter Road, Cullompton

A site of 1.4 hectares at Exeter Road is allocated for residential development, subject to; 35 dwellings (28% affordable), archaeological investigation, transport plan, air quality improvements and Sustainable Urban Drainage scheme (SUD).

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	There is an oak tree on the boundary with the road (covered with a temporary Tree Preservation Order). The Council will review existing species or habitats information held on previously allocated sites. The site falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The site is highly visible from B3181 a negative effect, further south there is dense tree cover which should screen wider views. Views into the site are generally short. Development of the site does extend the built nature of Cullompton further to the south. Given there will be some visual impact, an overall negative	-2	Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review also provide some mitigation therefore a neutral effect is considered.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	effect is considered.			
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential with regard to known prehistoric and Roman activity in the vicinity. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded archaeological condition on any consent granted may be required.	-1/?	Criteria within the policy seek mitigation measures through archaeological investigation.	0/?
C) Mitigating the effects of climate change	The Cole Brook runs to the north of the site on the opposite side of Exeter Road and a flood risk assessment may therefore be required to determine any potential impact. A flood risk assessment will also need to determine the specific recommendations for mitigation for the Critical Drainage Area that is identified at Cullompton. The site is located in flood zone 1 the lowest probability of flooding. Development on the site may increase surface water run-off and this would need to have mitigation measures.	-1	Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. The policy requires the inclusion of a sustainable urban drainage scheme, therefore a neutral effect is anticipated.	0
D) Safeguarding and minimising resource use	Development option consists of some residential land as well as a limited amount of greenfield (which is grade 3 agricultural land). The loss of this land is considered to be a minor negative effect of developing the site.	-1		-1
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street and other local retail could benefit from the custom of the residents from this development. There would be a slight positive effect.	+1		+1
G) Meeting	Option provides for 35 new dwellings of which 28% should be affordable a	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
housing needs	contribution towards future housing need, a large positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.			
H) Ensuring community health and wellbeing	The site is located 800 metres from the town centre, but closer to local shopping, leisure and school provision. The site has access to a footpath along the road into Cullompton. Option will have an impact on Cullompton Air Quality Management area which will require some mitigation. Overall therefore, a neutral impact is considered.	0	The policy requires implementation of a transport plan and other measures to minimise air quality impacts.	0
I) Delivering the necessary infrastructure	The site has a possible conflict with access to hospital (on opposite sides of the road) that will need addressing. There are two possible access options to the site, either through Swalcliffe site (the most northerly house), or jointly through Springbourne (the southerly house) in combination with the adjoining agricultural land. The site adjoins the good bus route along Exeter Road although there is no stop immediately adjacent the site. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places. Primary schools are at capacity and are both located on constrained sites making expansion either difficult or proportionally expensive. New school provision will be required early in the development. Overall a neutral effect.	0	Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options

	in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The estimated development time for this site is two years, and could come forward in the short term. Once developed, its impact will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Policy CU16: Cummings Nursery

A site of 2.78 hectares at Cummings Nursery is allocated for residential development, subject to; 120 dwellings (35% affordable), retention of floodplain as green infrastructure and amenity open space, noise mitigation, archaeological investigation, transport assessment and air quality improvements. For reference, this site was named 'Land at East Culm Farm' in the 2013 SHLAA Report, and is now split between this site allocation and East Cullompton.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	Most of the site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. A small sliver of land in the north west of the site falls within the 'Sparsely settled farmed valley floors' landscape character area. This area is typified by the presence of rivers or streams and related flat or gently sloping valley bottoms within the low lying areas of the district. The site is mostly flat and surrounded by high hedges, which largely screens it from views from the south and west. The impact of having housing on the site is likely to be no more effect than the existing glasshouse use on the landscape, a neutral effect.	0		0
B) Protection and promotion of a quality built and historic	The proposed development site lies in a landscape where prehistoric and Roman activity is recorded in the Historic Environment Record. The site has probably been disturbed by the construction of the greenhouses. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded	+2/?	Archaeological investigation may be required and form a criteria within the policy.	+2/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
environment	archaeological condition on any consent granted may be required. The site is occupied with a large number of derelict glasshouses and associated buildings and infrastructure. Redevelopment of the site would be a positive effect, as otherwise, the site is likely to deteriorate further, with potential negative impacts on the neighbouring residential properties. Therefore, an overall positive impact has been assumed.			
C) Mitigating the effects of climate change	The floodplain of the River Culm lies to the west of the site. The majority of the site falls within flood zone 1 the lowest probability of flood risk with the remaining 4% of site on the western portion part of the site falling within flood zone 3. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation. Taking into account flood risk and climate change an overall negative effect is considered, as well as the impact of surface water run-off from development on this site.	-2	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. Given that the policy specifies the retention of land within the floodplain. Criteria within the policy seek carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, a positive effect.	+1
D) Safeguarding and minimising	Development option is located on horticultural land (the glass houses); the glasshouses land, while not technically brownfield land, has existing buildings on site, and therefore the impact of redeveloping it would be positive, as the site has been derelict for a number of years.	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
resource use				
E) Promoting economic growth and employment	Though the site has previously been used for horticulture, this is not technically classed as employment land. Neither has any employment activity taken place on the site for the last ten years.	+1		+1
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street could benefit from the custom of the residents from this development. There would be some positive effect.	+1		+1
G) Meeting housing needs	Option provides for 120 new dwellings of which 35% should be affordable a contribution towards future housing need, a significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+3		+3
H) Ensuring community health and wellbeing	The site is located some distance from the town centre and remote from Cullompton town services/facilities. The option will have an impact on Cullompton Air Quality Management area which will require some mitigation. The site is in very close proximity to the motorway, the noise from which may negatively impact on residential amenity, a negative effect. Given the impact from the motorway, and separate from the main element of the town, an overall negative impact has been assumed.	-2	Criteria require appropriate noise mitigation and sound proofing to minimise the impact of the adjacent motorway.	-1
I) Delivering the necessary infrastructure	The site is the subject of a current planning application (now granted) where access could be achieved, although junction capacity may be an issue. There is a bus service between one and four journeys per day available on the A373. The requirement for a transport assessment is an uncertain effect. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more	-1/?	Criteria within the policy seek the provision of a pedestrian and cycle link to the town centre across the motorway and implementation of a transport plan. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places. Primary schools are at capacity and are both located on constrained sites making expansion either difficult or proportionally expensive. There may be capacity issues with the M5 from allocating further development on the east side of the motorway (hence the negative overall score) and more information will be required from the Highways Agency before a site can be allocated. Delivery of the site could be brought forward in conjunction with the strategic East Cullompton Site (CU11), and the infrastructure requirements will change if that option is pursued. Its scoring therefore reflects it coming forward as a sole site at present.		and facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Additional primary school capacity will be needed to accommodate the developments. This would be most suitably provided through a new 420 school at the North-West Cullompton site and a new school or schools providing for around 650 pupils within the East of Cullompton allocation. Additional secondary school capacity will need to be undertaken in consideration of the aspirations of the local schools and communities.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Part of the site now has planning permission and could come forward in the short term.
Spatial extent: (District wide / local)	This site option will help meet provide housing within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in

	the district.

Policy CU17: Week Farm

A site of 10.7 hectares at Week Farm is allocated for employment development, subject to; 15,000 sq metres of employment floorspace within use classes B2-B8, vehicular link from the Kingsmill employment area to Honiton Road, development should not to commence until the completion of the necessary improvements to M5 Junction 28, archaeological investigation, protection of existing public rights of way, transport assessment, 2 ha of green infrastructure including the retention of land in the flood plain.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site is visible from the far ridge to the east and west. The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. Given the site is located in an area less sensitivity to change and development only a slight negative effect is considered.	-1	Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review also provide some mitigation therefore a neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	This site lies within a landscape that has evidence of prehistoric and Roman activity recorded in the County Historic Environment Record. To the west, recent archaeological work has demonstrated the presence of prehistoric and Roman settlement in and around Cullompton. While no such sites are recorded within the area under consideration (though this may just reflect the absence of any formal archaeological work in this area) the Historic Environment Team would regard there to be potential for the site contain archaeological deposits associated with the known prehistoric and Roman activity in the vicinity. The Historic Environment Team would therefore advise that any planning application for the development of this site should be supported by the results of an appropriate programme of archaeological work to allow the archaeological potential of the site to be understood along with the impact of any development upon the heritage assets in the site. There is the potential therefore for a slight negative impact as a result.	-1/?	Criteria within the policy seek mitigation measures through archaeological investigation.	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
C) Mitigating the effects of climate change	The site is bounded to the west by the River Ken and its associated floodplain. The east part of the site is located in Flood zone 1 the lowest probability of flooding with the remaining western part in Flood Zones 2 and 3. As the site is proposed for commercial development a number of uses could be classed as 'less vulnerable' development and would therefore be compatible with Flood Zones 1, 2 and 3a, therefore only a slight negative effect is considered. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigations. Development of the site may increase surface water run-off on the site, a negative effect.	-2	Criteria within the policy seek the retention of 2 ha of green infrastructure to include the retention of land in the flood plain. A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. Development should be focussed in areas of least flood risk first and ensure any development in flood zone 2 and 3a are compatible with these flood zones, overall a neutral effect.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. Option would result in the loss of 5.4ha (east) of Grade 1 excellent quality agricultural land, 2.8ha (north) of Grade 3 good to moderate quality agricultural land and 2.5ha (west) Grade 4 poor quality agricultural land, a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district.	-2		-2
E) Promoting economic growth and employment	Proposed policy will help deliver 15,000 square meters of employment floorspace within use classes B2-B8 that will contribute towards bringing jobs into the area, a significant positive effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site.	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	There would therefore be a positive impact.			
F) Supporting retail	Site option does not result in the loss or gain of retail land, a neutral effect.	0		0
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0		0
H) Ensuring community health and wellbeing	The site is located some distance from the main part of Cullompton, potentially reducing opportunities for walking to work. However, given the scheme is to permit heavier industries such as B2-B8 uses, the location, adjacent to existing employment land is appropriate. The policy also requires the protection and enhancement of the existing public rights of way. Development at this location could have an impact on air quality, particularly given the type of vehicles (i.e. HGVs) which would be associated with B2/B8 uses.	-1	Criteria require the implementation of a Transport Plan and other measures to minimise carbon footprint and air quality impacts. Although there is still anticipated a minor negative effect.	-1
I) Delivering the necessary infrastructure	Highways Agency has a holding direction on significant development until improvements have been made to J28 of the M5. The policy requirement is for no development to commence until necessary improvement works to J28 (M5) have been completed. There is potential access onto the site via Honiton Road, and Saunders Way through the existing adjoining serviced employment land. Adjoining land was allocated in a previous Local Plan Review and is serviced land, readily available for development. Given the capacity limitations for junction 28 of the M5 and traffic implications for the Honiton Road alongside proposed mitigation measures a minor negative effect is considered. The requirement for a transport assessment is an uncertain effect.	-1/?	Criteria within the policy seek a vehicular link from Kingsmill employment area to Honiton Road, a neutral effect. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0/?

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity

	issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once developed, development will be permanent. The site could come forward in the short-medium term, given that improvements to J28 are due to take place in the near future.
Spatial extent: (District wide / local)	Development would be focussed in Cullompton, the second town in the district with good connections to the M5 strategic road corridor, but the employment here could have a wider draw across the district and beyond.

Policy CU18: Venn Farm

A site of 4.4 hectares is allocated for employment development, subject to; 10,000 sq metres of employment floorspace within use classes B2-B8, vehicular access which directs traffic to and from the site via Saunders Way, no development until necessary improvements to M5 Junction 28, archaeological investigation, transport assessment and measures to minimise carbon footprint and air quality impacts, environmental measures, retention of areas within flood plain as green infrastructure.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is flat and can only be viewed from very distant ridgelines, a slight negative effect.	-1	Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review also provide some mitigation therefore a neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential and within a floodplain of the River Culm. Ground disturbance in this area may expose archaeological and palaeo-environmental deposits, a slight negative effect. The Historic Environment Team would therefore advise that any planning application for the development of this site should be conditional upon an appropriate programme of archaeological work being undertaken in mitigation for the impact of the development upon the heritage assets that may be affected by development within the site.	-1/?	Criteria within the policy seek mitigation measures through archaeological investigation.	0/?
C) Mitigating the effects of	The eastern part of the site is within flood zone 1. The western part of the site is within flood zones 2 and 3. As the site is proposed for commercial	-2	Criteria within the policy seek the retention of area within the flood	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
climate change	development a number of uses could be classed as 'less vulnerable' development and would therefore be compatible with Flood Zones 1, 2 and 3a, therefore only a slight negative effect is considered. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation. The site currently has some surface water issued and development on the site may increase surface water-run off without appropriate mitigation, a negative effect.		plain as green infrastructure. A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. Development should be focussed in areas of least flood risk first and ensure any development in flood zone 2 and 3a are compatible with these flood zones, overall a neutral effect.	
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. The option would result in the loss of 3.9ha of Grade 3 good to moderate quality agricultural land and 0.8ha of grade 4 poor quality, a negative effect.	-1		-1
E) Promoting economic growth and employment	Proposed policy will help deliver 10,000 square metres of employment floorspace that will contribute towards bringing jobs into the area, a significant positive effect. Criteria within the policy seek a suitable amount of employment floor space. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site.	+3		+3
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect.	0		0
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral	0		0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	effect.			
H) Ensuring community health and wellbeing	The site is located some distance from the main part of the town, which would reduce opportunities for walking to work. The option may have an impact on Cullompton Air Quality Management area which will require some mitigation not currently set out in a policy.	-2	Criteria require the implementation of a Transport Plan and other measures to minimise carbon footprint and air quality impacts.	-1
I) Delivering the necessary infrastructure	There are capacity issues at J28 however improvement works are planned. Suitable highways access is unknown. Vehicular access which directs traffic to and from the site via Saunders Way. The requirement for a transport assessment is an uncertain effect.	-1/?	The policy requires a suitable vehicular access and that no development should commence until necessary improvements to M5 Junction 28. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0/?

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once developed, development will be permanent. The site could come forward in the short-medium term, given that improvements to J28 are due to take place in the near future.
Spatial extent: (District wide / local)	Development would be focussed in Cullompton, the second town in the district with good connections to the M5 strategic road corridor, but the employment here could

	have a wider draw across the district and beyond.

Policy CU19: Town Centre Relief Road

A relief road providing traffic to the town centre will be provided subject to; public consultation on its proposed route, provision of replacement open space and sporting facilities within the Cullompton Community Association Fields and elsewhere, footpaths and cycle ways & Environmental measures.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The Town Centre Relief Road route is an integral part of the development strategy for Cullompton designed to relieve traffic through the town centre in conjunction with a road through the North West urban extension. The evidence in 2010 concluded that a new road to the east of the town centre is essential if the objectives of traffic, air quality improvements with town centre improvements are to be achieved. Careful consideration will be taken to finalise the route which could be located either side of the motorway. The aim will be to minimise impact on the CCA fields. The route of the Relief road could lead to the severance of wildlife corridors and wildlife networks, a negative effect. The CCA fields are also designated as a priority habitat, which may be negatively affected by the development, requiring mitigation or alternative provision.	-2	Criteria within the policy seek measures to protect and strengthen trees, hedgerows and other environmental features which contribute to the character and biodiversity, maintain wildlife networks within the site and surrounding countryside, although this is still considered to have an overall negative effect.	-2
B) Protection and promotion of a quality built and historic environment	Site option does not impact positively or negatively on the quality of the built or historic environment, a neutral effect.	0	The inclusion of a criterion within the policy for a public consultation exercise before the route is determined should help in the selection of the most appropriate design solution. Hence, a slight positive impact has been scored.	+1
C) Mitigating the effects of climate change	The proposed route of the Cullompton Town Centre Relief Road crosses a large part of flood zone 3, a negative effect. The site has been increased from the west side of the M5 to both sides of the M5 to provide more a greater option for locating the road and protecting as much of the CCA fields as possible. Road infrastructure is classed as essential infrastructure	-3	Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. Policy's elsewhere in the Plan seek the	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	and must pass the sequential test and exception test if in flood zone 3a or 3b. The site also may be impacted by fluvial overtopping of the Spratford Stream and an unnamed watercourse, a negative effect. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation. Development on the site would increase surface water run-off without mitigation, a negative effect.		provision of sustainable urban drainage scheme to deal with all surface water from the development. The development has passed sequential and exception tests as Devon County Council confirms this is the only option that can deal with the air quality within the town. A positive effect.	
D) Safeguarding and minimising resource use	The land is greenfield, with some used for sports and recreation purposes. The agricultural classification is grade 4, some of the lowest quality, and its loss is therefore considered a slight negative effect.	-1		-1
E) Promoting economic growth and employment	Site option may, depending on where it is located, result in the loss of employment land, a negative effect. The Town Centre Relief Road is expected to provide traffic relief to the town centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business, a positive effect.	+2		+2
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect. The Town Centre Relief Road is expected to provide traffic relief to the town centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business, a positive effect.	+2		+2
G) Meeting housing needs	Site option does not result in the loss or gain of residential land, a neutral effect	0		0
H) Ensuring community health and wellbeing	Cullompton is a declared Air Quality Management Area. It has an approved Air Quality Action Plan. The Action Plan identifies a number of measures to improve air quality, including the provision of a relief road. There are air quality problems through Nitrogen Dioxide in parts of Station Road, Higher	+1	Criteria within the policy seek provision of replacement open space and sporting facilities within Cullompton Community	+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Street and Fore Street. The source of this is road traffic. The completion of the relief road system with associated traffic management measures will reduce the level below those that have an adverse effect. In addition it will provide traffic relief to the Town Centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business. The evidence in 2010 concluded that a new road to the east of the town centre is essential if the objectives of traffic relief, air quality improvement and with it town centre enhancement, are to be achieved. The Town Centre Relief Road is an integral part of the existing development strategy for Cullompton, designed to relieve traffic through the town centre in conjunction with a road through the North West Urban Extension to link Tiverton Road to Willand Road, a significant positive effect on air quality within the town centre. Careful consideration will be taken to finalise the route which could be located either side of the motorway. The construction of the road could have an impact on the area of open space and recreation value, a negative effect. Careful consideration will therefore need to be taken in finalising the route and the aim will be to cause minimum impact on the CCA fields.		Association Fields or elsewhere in Cullompton, enhancement of the existing footpath to form a shared use foot and cycleway and a public consultation exercise before the route is determined. Given the potential for impact on the CCA fields but the proposed mitigation measures and significant improvements to air quality, an overall positive effect is considered.	
l) Delivering the necessary infrastructure	The Town Centre Relief Road is an integral part of the existing development strategy for Cullompton, designed to relieve traffic through the town centre, a positive effect. The proposed route of the Town Centre Relief Road will likely have an impact on the area of open space and recreation value (Green Infrastructure). Additional housing development has now taken place at Knowle Lane and Tiverton Road, contributing to Junction 28 improvements and funding for the Town Centre Relief Road, but work on the Town Centre Relief Road has not yet commenced. The delivery of the road depends upon the delivery of the North West urban extension (Policy CU1). The Council will also seek external sources of funding to pay for the road. Overall the Town Centre Relief Road is a key piece of local infrastructure and its delivery will have a significant local impact.	+3		+3

Secondary/cumulative/synergistic effects:	This policy supports many of the other Cullompton policies and is a necessary piece of local infrastructure which is required to mitigate traffic and air quality impacts associated with existing and future developments in the town.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Development will only take place once sufficient Community Infrastructure Levy monies have been collected and therefore is not likely to happen in the short term. Once built out, development will be permanent.
Spatial extent: (District wide / local)	The Town Centre Relief Road will improve travel movements for Cullompton.

Policy CU20: Cullompton Infrastructure

The policy safeguards the Cullompton Railway Station and Car Park and seeks Community Infrastructure Levy (CIL) and planning obligations to deliver; the provision of the Town Centre Relief Road and other measures in the Cullompton Air Quality Action Plan, Mitigation to reduce traffic impacts on the Trunk and Local Road network in association with the East Cullompton Urban Extension, improvements to increased capacity at M5 Junction 28 and town centre regeneration and enhancement, Extra care housing provision, Expansion of library facilities, Primary and secondary education facilities; Bus service enhancements; Provision of railway and bus stations, Expansion of emergency fire and rescue services, Provision of healthcare facilities and Community facilities.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The Town Centre Relief Road route is an integral part of the development strategy for Cullompton designed to relieve traffic through the town centre in conjunction with a road through the North West urban extension. The evidence in 2010 concluded that a new road to the east of the town centre is essential if the objectives of traffic, air quality improvements with town centre improvements are to be achieved. Careful consideration will be taken to finalise the route which could be located either side of the motorway. The aim will be to minimise impact on the CCA fields. The route of the relief road could lead to the severance of wildlife corridors and wildlife networks, a negative effect. The proposed location of the train station is not anticipated to have a wildlife impact.	-2	Policy CU19 Town Centre Relief Road include measures to protect and strengthen trees, hedgerows and other environmental features which contribute to the character and biodiversity, maintaining a wildlife network within the site and lining to the surrounding countryside. Although there is still considered to be an overall negative effect.	-2
B) Protection	The town centre regeneration and enhancement measures are anticipated	0		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
and promotion of a quality built and historic environment	to have a positive effect on the Cullompton Conservation Area. The policy will also seek funds to support the enhancement and regeneration of the town centre.			
C) Mitigating the effects of climate change	The proposed route of the Cullompton Town Centre Relief Road crosses flood zone 3, a negative effect. Road infrastructure is classed as essential infrastructure and must pass the sequential test and exception test if in flood zone 3a or 3b. The sequential and exception tests are passed as Devon County Council confirm this is the only option that can deal with Air Quality within the town. The reopening of a train station at this location, could enable local residents to commute to work by train, rather than by car – particularly to Exeter, where a large number of the town's residents work. This would have a significant impact on reducing carbon emissions and take a number of cars off the road network. The position of the train station is partly within flood zone 3 and overtopping of the Spratford Stream increased fluvial flood risk. A negative effect. One Critical Drainage Area is identified at Cullompton. A flood risk assessment will be required at the planning application stage to determine specific recommendations for mitigation.	-3	Policy CU19 Town Centre Relief Road is needed to deal with the Air Quality in Cullompton adequately. Provision of a sustainable urban drainage scheme would deal with all surface water from the development and arrangements for future maintenance. Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. The provision of more sustainable means of transport (the reopening of the train station) would help to reduce carbon emissions through private travel, a positive impact.	+2
D) Safeguarding and minimising resource use	The site identified for the railway station is currently comprised of brownfield land, whilst the area of search for the Town Centre Relief Road is grade 4 agricultural land (low quality land). Overall, a slight positive impact has been assumed.	+1		+1
E) Promoting economic growth and employment	The Town Centre Relief Road is expected to provide traffic relief to the town centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business, a positive effect. Junction 28 of the M5 motorway to the east of Cullompton has been	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	identified as being at close to capacity during peak hours and therefore has limited capacity to accommodate additional development. The delivery of Junction improvements will unlock housing and employment capacity within Cullompton, a positive effect.			
F) Supporting retail	The Town Centre Relief Road is expected to provide traffic relief to the town centre, thereby allowing for environmental improvements, better facilities for pedestrians and economic benefits for business, a positive effect. The policy will also ensure funds are collected to go towards town centre regeneration and enhancement.	+2		+2
G) Meeting housing needs	Junction 28 of the M5 motorway to the east of Cullompton has been identified as being at close to capacity during peak hours and therefore has limited capacity to accommodate additional development. The delivery of Junction improvements will unlock housing capacity within Cullompton, a positive effect. The policy also supports Extra care housing provision.	+2		+2
H) Ensuring community health and wellbeing	The Town Centre Relief Road route is an integral part of the development strategy for Cullompton designed to relieve traffic through the town centre in conjunction with a road through the North West urban extension. Careful consideration will be taken to finalise the route which could be located either side of the motorway. The aim will be to minimise impact on the CCA fields. The construction of the road is likely to have an impact on the on the area of open space and recreation value, a negative effect. The Town Centre Relief Road is an integral part of the existing development strategy for Cullompton, designed to relieve traffic through the town centre in conjunction with a road through the North West Urban Extension to link Tiverton Road to Willand Road, a significant positive effect on air quality within the town centre. The policy supports the Expansion of library facilities, Primary and secondary education facilities; Bus service enhancements; Provision of railway and bus stations, Expansion of emergency fire and rescue services, Provision of healthcare facilities and Community facilities. Overall, there is a balancing act between these effects, a neutral effect has been assumed.	0	Policy CU19 Town Centre Relief Road includes provision of replacement open space and sporting facilities within the Cullompton Community Association fields and/or elsewhere in Cullompton. A neutral effect.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
I) Delivering the necessary infrastructure	The Council plans to use the Community Infrastructure Levy to secure funding for offsite infrastructure delivery in the majority of cases, but there will be circumstances where it is still appropriate to use a planning obligation. The Council's strategic infrastructure policy is set out earlier in this document under Policy S8, but there are infrastructure requirements specific to Cullompton that are listed under Policy CU19. The Council will use the Community Infrastructure Levy and other sources of funding to deliver the infrastructure listed, and where planning obligations are sought, this policy will be the basis for negotiation. • The Local Transport Plan includes a long-term aspiration to reopen Cullompton Railway Station. A broad location north of Station Road is now identified as a possible site for the new station. The Local Plan Review protects land for a car park associated with any reopening of the station, a positive effect. • The Cullompton Air Quality Action Plan identifies a number of additional measures that will contribute towards improved Air Quality in the town centre. The Town Centre Relief Road is an integral part of the existing development strategy for Cullompton, designed to relieve traffic through the town centre, significant a positive effect. • Junction 28 of the M5 motorway to the east of Cullompton has been identified as being at close to capacity during peak hours and therefore has limited capacity to accommodate additional development. In consultation with Devon County Council, the Highways Agency has agreed a scheme for the improvement of the junction to increase its capacity, a significant positive effect. • The Cullompton Air Quality Action Plan (AQAP) and the Cullompton Conservation Area Management Plan (CAMP) identify a number of potential opportunities for the enhancement of the town centre, through their delivery a positive effect to the town centre is anticipated.	+3		+3

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	• The improvement to walking and cycling links are identified as action plan measures in the Cullompton Air Quality Action Plan. The provision of shared use surface between Honiton Road and Old Hill Road at Last Bridge has the potential to enhance access to employment opportunities. This improvement also aims to help to reduce car trips between the town and the major industrial area to the east of the M5 motorway, a positive effect. In combination this policy is considered to contribute towards an overall significant positive effect towards Cullompton's infrastructure requirements.			

Secondary/cumulative/synergistic effects:	This policy supports many of the other Cullompton policies and collects funds towards necessary pieces of local infrastructure. This infrastructure is required to mitigate traffic and air quality impacts associated with existing and future developments in the town, and provide opportunities to reduce carbon emissions by providing access to sustainable modes of transport.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The policy will have impacts over the lifetime of the plan, as monies will be gathered during all periods with development only likely to take place in the longer term.
Spatial extent: (District wide / local)	The impacts of the policy are likely to be wider than just Cullompton – as they are likely to provide means to improve transportation infrastructure which will facilitate commuting within the district and across the district's boundary.

Policy CU21: Land at Colebrook (Contingency)

A site of 4.8 hectares is allocated for residential development, subject to; 100 dwellings (28% affordable), until the Town Centre relief road has been provided, upgrading of Colebrook Lane to accommodate additional traffic and two points of access from Siskins Chase, 1.1 ha of green infrastructure and retention of the land in the flood plain for open space, environmental measures, archaeological investigation, transport assessment and air quality improvements.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The central band of the site falls within the 'Sparsely settled farmed valley floors' landscape character area. This area is typified by the presence of rivers or streams and related flat or gently sloping valley bottoms within the low lying areas of the district. The north and south portions of the site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is reasonably enclosed closer to Colebrook Lane, and is part of a rolling landscape. There is limited wider landscape impact, but a more localised impact if the site is developed.	-1	Criteria within the policy seek measures to protect and strengthen environmental features which contribute towards the character and biodiversity of the surrounding countryside and mitigation through 1.1ha of green infrastructure including the protection of amenity local space. Given the mitigation measures but localised impact a neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	This site occupies a large area in a landscape with evidence of prehistoric and Roman activity in the vicinity. Any planning application for development here will need to be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of the development upon it.	-1/?	Criteria within the policy seek mitigation measures through archaeological investigation.	0/?
C) Mitigating the effects of climate change	Kia Ora Farm and fishing lakes to west of site. The Cole Brook runs from the west to the south of the site. The site has been greatly reduced in size, where the Cole Brook circled the bottom half of site, and was then parallel to boundary (on south east side). The north and eastern part of the site falls within flood zone 1.A small section of the site following Cole Brook is in the functional floodplain. Development on the site may increase surface water run-off. A negative effect. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation. Taking into account flood risk and mitigation measures for climate change an overall negative effect is considered.	-2	Criteria within the policy seek mitigation measures through retention of land in the floodplain as informal amenity open space. A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Policy S11 Cullompton supporting text acknowledges the Critical Drainage	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			Area at Cullompton which provides mitigation. Criteria within the policy seek carbon reduction and air quality improvements, this is required to minimise the overall carbon footprint of the development and ensure the impact of the site on air quality is acceptable, a slight positive effect.	
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. Policy would result in the loss of 0.2ha of grade 1 excellent quality agricultural land & 4.6ha of grade 3 good to moderate quality agricultural land, a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Overall a negative impact.	-2		-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land. Development of this scale may be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1		+1
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street could benefit from the custom of the residents from this development. There would be a slight positive effect.	+1		+1
G) Meeting housing needs	Option provides for 100 new dwellings of which 28% should be affordable a contribution towards future housing need, a significant positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+3		+3
H) Ensuring community health and	The site is located some distance from the town centre. The option will have an impact on Cullompton Air Quality Management area which will require some mitigation. The option could contribute towards light and	-1	Criteria require the implementation of a Transport Plan and other measures to minimise	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
wellbeing	noise pollution, a slight negative effect. The site includes 1.1ha of informal open space, allowing opportunities for outdoor play. Balancing all factors, a slight negative impact has been assumed.		carbon footprint and air quality impacts.	
I) Delivering the necessary infrastructure	The width of Colebrook Lane from Swallow Way may present difficulties with access and would need to be substantially upgraded. Development in this location would increase traffic on Tiverton Road, so would not be permissible until a new road linking Tiverton Road to Willand Road has been provided under Policy CU1. The requirements for a transport assessment is an uncertain effect. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places. Overall, therefore, the impact on infrastructure is considered to be slightly negative.	-1/?	Criteria within the policy seeks provision of two points of access from Siskins Close. Further mitigation criteria within the policy state that no development should occur until the Town Centre Relief Road has been provided. Given the mitigation measures set out in criteria within the policy and the fact that infrastructure would need to be in place prior to development beginning, an overall neutral impact has been assumed. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0/?

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Additional primary school capacity will be needed to accommodate the developments. This would be most suitably provided through a new 420 school at the North-West Cullompton site and a new school or schools providing for around 650 pupils within the East of Cullompton allocation. Additional secondary school

	capacity will need to be undertaken in consideration of the aspirations of the local schools and communities.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. However, as the site could only come forward once the Town Centre Relief Road is in place, development is only likely to take place in the medium-long term. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help provide housing for the district. Development would be focussed as an extension to the second town in the district.

Cullompton Alternative Site Options

Acklands, Cullompton

Option

A site of 1.4 hectares could be allocated for residential development, subject to; 45 dwellings (28% affordable), assessment demonstrating that the playing pitches are surplus to requirements, completion of the NW Cullompton link road, implementation of M5 improvements, transport assessment and air quality improvements, and archaeological investigation

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. To the north the views are of higher ground. To the east is modern housing, and more is planned for the northern area. The site is likely to be surrounded, a neutral effect.	0		0
B) Protection and promotion of a quality built and	The site lies in an area of known prehistoric activity, a slight negative effect. In accordance with the NPPF any planning application for development here should be supported by an appropriate programme of archaeological work to allow the significance of any below-ground heritage assets with an	-1/?	Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
historic environment	archaeological interest to be understood along with the potential impact of any development upon them. This would allow any mitigation that may be required to be implemented in advance of construction.		standard worded archaeological condition on any consent granted may be required	
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest probability of flooding, a neutral effect. Development on the site may increase surface water run-off, a negative effect. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine the specific recommendations for mitigation.	-1	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. An overall neutral effect.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land. The site is located on Grade 1 agricultural land of the highest quality. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Given the loss of the highest grade agricultural land, a negative effect is considered.	-2		-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street could benefit from the custom of the residents from this development. There would be a minor positive effect.	+1		+1
G) Meeting housing needs	Option provides for 34 new dwellings of which 28% should be affordable a contribution towards future housing need, a positive effect.	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
H) Ensuring community health and wellbeing	The site is located 900 meters distance from the town centre, as the crow flies. Cullompton town centre has a wide range of services and facilities. The option will have an impact on Cullompton Air Quality Management area which will require some mitigation (which should been included within the policy). The site is agricultural land, but is used informally by the adjacent rugby club as practice space. The option could contribute towards light and noise pollution, a slight negative effect. Primary schools are at capacity and are both located on constrained sites making expansion either difficult or proportionally expensive. Balancing all factors, a slight negative impact has been assumed.	-1	Criteria in the policy seek submission of an assessment demonstrating that the playing pitches are surplus to requirements or demonstration that the loss is to be replaced by equivalent or better provision in a suitable, accessible location.	0
I) Delivering the necessary infrastructure	Current planned junction improvements to Junction 28 will cater for current allocated site and any additional development would provide for concerns over capacity. Suitable linkage to new distributor road would be required and Transport assessments as well as Travel planning is required. A requirement for a transport assessment in an uncertain effect. New school provision will be required early in the development. The secondary school is forecast to have capacity but may require additional infrastructure later in the planning period including land. There is a shortage of early year's provision in the town which will be exacerbated but further development. Given the need for further junction improvements at J28 of the M5 and school capacity issues within the town an overall negative effect is considered.	-2/?	No development should be allowed until suitable measures at Junction 28 or other mitigating works can be undertaken to the satisfaction of the Highway Authority and the Highways Agency. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0/?

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Additional primary school capacity will be needed to accommodate the developments. This would be most suitably provided through a new 420 school at the North-West Cullompton site and a new school or schools providing for around 650 pupils within the East of Cullompton allocation. Additional secondary school

	capacity will need to be undertaken in consideration of the aspirations of the local schools and communities.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. However, as the site could only come forward once the Town Centre Relief Road is in place, development is only likely to take place in the medium-long term. Once completed the development will be permanent.
Spatial extent: (District wide / local)	This site option will significantly help provide housing for the district. Development would be focussed as an extension to the second town in the district.

Tiverton Road, Cullompton
Option

A site of 1.9 hectares south of Tiverton Road is allocated for residential development, subject to; 45 dwellings (28% affordable), no development until a road linking Tiverton Road to Willand Road is provided (a requirement under policy CU1 'North West Cullompton), archaeological investigation, transport plan and air quality improvements and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This site falls within the 'Lower rolling farmed and settled valley slopes' landscape character area. This area is typified by having a gently rolling and strongly undulating landscape which is intensively farmed. The site is fairly enclosed by hedgerows and the land at the bottom of the site rises, with the land beyond rising further. The site at present is viewable from some low distant ridges in the west, and developing it would raise the prominence of the built environment to the west of Cullompton. However, this will be mitigation by the adjacent allocations once built out. Given the small size of the site, its low visibility and mitigation of by the adjacent allocated sites, a neutral effect is anticipated	0		0
B) Protection and promotion of a quality built and	The St. Andrew's Hill roman fort (a scheduled ancient monument) lies to the east. The site lies in an area of archaeological potential to the west of the Roman fort at St Andrew's Hill and in an area where Roman finds have been recorded. Given the archaeological potential of the site, any planning	-1/?	Criteria within the policy seek archaeological investigation and mitigation, which should reduce the impact.	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
historic environment	application for development here must be supported by the results an appropriate level of archaeological works to allow the significance of the heritage asset to be understood along with the impact of any development upon it. A slight negative impact is considered.			
C) Mitigating the effects of climate change	Site is located within flood zone 1, the lower level of flood risk, a neutral effect. Development may result in surface water run-off which would need to be mitigated, a negative impact. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation.	-1	Policy S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. Criteria within the policy seek the provision of a sustainable urban drainage scheme to deal with surface water from the development and arrangements for future maintenance, a neutral effect is considered.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. Option would result in the loss of Grade 1 high quality agricultural land, a negative effect. Grade 1 agricultural land in Mid Devon amounts to 32.4 square kilometres, only 3.5% of the district. Therefore, a negative impact of developing the site has been assumed, despite the small size of the site.	-2		-2
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1		+1
G) Meeting housing needs	Option is not currently well related to the existing built form at Cullompton, but could form an extension to other adjacent sites once they are built out.	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. Option provides for 45 new dwellings of which 28% should be affordable - a contribution towards future housing need, a positive effect.			
H) Ensuring community health and wellbeing	Site option does not result in the loss or gain of community facilities or open space, a neutral effect. The option will have an impact on Cullompton Air Quality Management area which will require some mitigation, whilst there could be light and noise pollution impacts.	-1	The policy requires implementation of a transport plan and other measures to minimise air quality impacts.	0
I) Delivering the necessary infrastructure	The site has no suitable access to the highway, and the existing roads are not ideal at present as they are constricted, a negative effect. Widening of existing adjacent roads would be necessary. There are issues with Tiverton Road, however an adequate site access is achievable. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places. Primary schools are at capacity and are both located on constrained sites making expansion either difficult or proportionally expensive. Given transport infrastructure constraints and education capacity a negative effect is considered.	-2	The policy has been written so that development should only come forward once local infrastructure being delivered by an adjacent site is completed. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with

	consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The impact of this site is likely to be medium-long term, given it cannot come forward before local infrastructure has been completed. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Court Farm, Cullompton

Option

A site of 1.4 hectares at Court Farm is allocated for residential development, subject to; 35 dwellings (28% affordable), transport plan, air quality improvements and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The remaining area is largely surrounded by existing development, visual and landscape impacts are considered minimal, a neutral effect. Much of the remaining area is previously developed, so impacts on biodiversity are expected to also be minimal. However, the Council will review existing species or habitats information held on previously allocated sites.	0		0
B) Protection and promotion of a quality built and historic environment	There are no listed buildings within or adjoining the site. The Cullompton Conservation Area adjoins the site to the south but there is no anticipated impact This site has already been subject to a programme of archaeological investigation and no further work is required on this site.. Most of the site is comprised of existing commercial buildings, in various states of use and repair. Redeveloping the site offers the opportunity to improve the local built environment. Therefore a positive impact is assumed.	+2		+2
C) Mitigating the effects of	There is a river and floodplain to the north of the northern section of this site while the southern portion of site is located in flood zone 1 the lowest	-2	Criteria within the policy seek the provision of a sustainable urban	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
climate change	probability of flooding, a neutral effect. There is potential fluvial flood risk from overtopping of the Spratford Stream and development on the site may result in surface water run-off. One Critical Drainage Area One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation.		drainage scheme to deal with surface water from the development and arrangements for future maintenance, a neutral effect is considered. Sustainable urban drainage scheme should also mitigate for overtopping of the Spratford Stream. S11 Cullompton supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation.	
D) Safeguarding and minimising resource use	0.2ha is contaminated land as a result of textile manufacturing, whilst 0.4ha is from factory work a slight negative impact. Developing the site would require the remediation of the soil, which is considered to be a positive impact. The site is located on previously developed land and will not result in the loss of greenfield sites, which is also considered a positive effect. Because of site contamination overall a slight positive effect is considered.	+1	Remediation of contaminated land within the site.	+2
E) Promoting economic growth and employment	Redeveloping the site will result in the loss of a small number of employment units within the south west corner of the site, a negative effect. These are units which are used, but not of the highest quality. A minor negative impact is therefore associated with their loss.	-1		-1
F) Supporting retail	The site is located close to the town centre and Tesco supermarket. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a small positive effect.	+1		+1
G) Meeting housing needs	Option is well related to the existing built form being located within an existing built up area - positive effect. The option provides for 35 new dwellings of which 28% should be affordable a contribution towards future housing need, a further significant positive effect. The mix of dwellings to	0		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.			
H) Ensuring community health and wellbeing	The site is located close to the town centre, a medical centre and Tesco superstore and there is pedestrian and cycle access to the site from Willand Road, a positive effect. Site option does not result in the loss or gain of community facilities or open space, a neutral effect. Developing the site could have an impact on Cullompton Air Quality Management area which will require some mitigation. Given the positive effect of the sites location near to local facilities, an overall neutral impact has been assumed.	0	The policy requires implementation of a transport plan and other measures to minimise air quality impacts.	+1
I) Delivering the necessary infrastructure	There is an existing access, however the multiple landowners would need to come forward together to see this delivered. This could hamper efforts to bring the site forward. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places. Primary schools are at capacity and are both located on constrained sites making expansion either difficult or proportionally expensive. New school provision will be required early in the development. Potentially a slight negative effect.	-1	Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at

	Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Advice given to the Council suggests this site could take time to come forward, therefore the temporal impacts are likely to be medium to long-term. Once built the effects are permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Bradninch Road, Cullompton
Option

A site of 1.1 hectares at Bradninch Road could be allocated for residential development, subject to; 25 dwellings (28% affordable), access from Exeter Road, archaeological investigation, transport plan, air quality improvements and Sustainable Urban Drainage (SUD).

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	This sites falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The site slopes steeply and development would be very prominent, with large potential for visual impact.	-2	Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review also provide some mitigation therefore a slightly negative impact is considered.	-1
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential with regard to known prehistoric and Roman activity in the vicinity. Archaeological mitigation in the form of a programme of archaeological work undertaken through the application of a standard worded condition on any consent granted may be required.	-1/?	Criteria within the policy seek mitigation measures through archaeological investigation.	0/?
C) Mitigating the effects of climate change	The site is located in flood zone 1 the lowest probability of flooding, however, given the steeply sloping nature of the site there is the potential for surface water run-off to cause impacts elsewhere. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for	-1	The policy includes sustainable urban drainage to mitigate any impact, therefore a neutral effect is anticipated. Policy S11 Cullompton supporting text acknowledges the	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	mitigation.		Critical Drainage Area at Cullompton which promotes mitigation.	
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. Option would result in the loss of grade 3 good to moderate quality agricultural land, a slight negative effect.	-1		-1
E) Promoting economic growth and employment	Site option does not result in the loss or gain of employment land, a neutral effect.	0		0
F) Supporting retail	Option is located some distance from the town centre. The policy contains no retail proposals, however the high street would benefit from the custom of the residents from this development. There would be a slight positive effect.	+1		+1
G) Meeting housing needs	Option provides for 35 new dwellings of which 28% should be affordable a contribution towards future housing need, a large positive effect. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance.	+2		+2
H) Ensuring community health and wellbeing	The site is located 800 metres from the town centre. Option will have an impact on Cullompton Air Quality Management area which will require some mitigation. The neighbouring use to the site is housing but at a lower level, therefore there may be some issues with overlooking. A frequent bus service is available nearby. Considering all impacts, a balanced (and therefore neutral) impact is considered.	0	The policy requires implementation of a transport plan and other measures to minimise air quality impacts. Development should reduce opportunities for overlooking of any adjacent residential properties.	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
I) Delivering the necessary infrastructure	Access to the site would only be possible through land at Exeter Road site CU7, which has access difficulties. The Mid Devon Community Infrastructure Evidence Report indicates that there is a pressing need for new primary places in Cullompton. The two schools in the town, St Andrews and Willowbank currently accept more pupils than their planned admission number for the size of school and facilities available there. There are two secondary schools located within this Local Learning Community, including Cullompton Community College which currently has 283 places spare capacity and Uffculme School, which currently admits 113 pupils more than its planned admission number. It will therefore be necessary to expand the secondary schools in the Local Learning community to provide roughly 334 places. Primary schools are at capacity and are both located on constrained sites making expansion either difficult or proportionally expensive. New school provision will be required early in the development. Overall a slight negative effect is possible.	-1	Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site and the other possible options in the plan within Cullompton have the potential to impact upon traffic, put pressure on services and facilities. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	The estimated development time for this site is two years, and it could come forward in the short term. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Cullompton including for affordable housing. Development would be focussed in Cullompton, the second town in the district.

Land adj Venndale, NW Long Moor Road

A site of 2.9 hectares could be allocated for employment development, subject to; a suitable amount of floorspace (potential for 6,090 sq metres of employment floorspace), vehicular access, no development until necessary improvements to M5 Junction 28, Sustainable Urban Drainage (SUD) and Green Infrastructure.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The sites falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is flat and can only be viewed from very distant ridgelines, a slight negative effect.	-1	Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review also provide some mitigation therefore a neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	This sites lies in an area of archaeological potential Ground disturbance in this area may expose archaeological and palaeo-environmental deposits, a slight negative effect. The Historic Environment Team would therefore advise that any planning application for the development of this site should be conditional upon an appropriate programme of archaeological work being undertaken in mitigation for the impact of the development upon the heritage assets that may be affected by development within the site.	-1/?	Criteria within the policy option seek mitigation measures through archaeological investigation.	0/?
C) Mitigating the effects of climate change	The whole of the site is within flood zone 1. Development on the site may result in surface water run-off, a negative impact.	-1	Criteria within the policy seek the retention of area within the flood plain as green infrastructure. Policy S11 supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			maintenance. Development should be focussed in areas of least flood risk first and ensure any development in flood zone 2 and 3a are compatible with these flood zones, overall a neutral effect.	
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. The option would result in the loss of Grade 3 good to moderate quality agricultural land, a slight negative effect.	-1		-1
E) Promoting economic growth and employment	Proposed policy will help deliver 6,090 sqm of employment floorspace that will contribute towards bringing jobs into the area, a significant positive effect. Criteria within the policy seek a suitable amount of employment floor space, a positive effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site.	+3		+3
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect.	0		0
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0		0
H) Ensuring community health and wellbeing	The site is located some distance from the main part of the town, which would reduce opportunities for walking to work. The option may have an impact on Cullompton Air Quality Management area which will require some mitigation not currently set out in a policy.	-2	The policy requires implementation of a transport plan and other measures to minimise air quality impacts.	-1
I) Delivering the necessary infrastructure	There are capacity issues at J28 however improvement works are planned. Suitable highways access is unknown.	-1	Criteria within the state that the development cannot come forward until improvement works to J28 have taken place. Policy S8 also provides mitigation by setting out that developers will be expected to	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	

NW Kingsmill Industrial Estate, Cullompton

Option

A site of 5.9 hectares could be allocated for employment development, subject to; a suitable amount of floorspace (potential for 15,000 sq metres of employment floorspace), vehicular access, no development until necessary improvements to M5 Junction 28, Sustainable Urban Drainage (SUD), retaining of areas within flood plain and Green Infrastructure.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The sites falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. The site is flat and can only be viewed from very distant ridgelines, a slight negative effect.	-1	Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review also provide some mitigation therefore a neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	This sites lies in an area of archaeological potential and within a floodplain of the River Culm. Ground disturbance in this area may expose archaeological and palaeo-environmental deposits, a slight negative effect. The Historic Environment Team would therefore advise that any planning application for the development of this site should be conditional upon an appropriate programme of archaeological work being undertaken in mitigation for the impact of the development upon the heritage assets that may be affected by development within the site.	-1/?	Criteria within the policy option seek mitigation measures through archaeological investigation.	0/?

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
C) Mitigating the effects of climate change	Development in the area of floodplain should be avoided and in the northwest part of the site is flood zone 2 and flood zone 3. The remaining south western part of the site is located in flood zone 1. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation. As the site is proposed for commercial development a number of uses could be classed as 'less vulnerable' development and would therefore be compatible with Flood Zones 1, 2 and 3a, therefore only a slight negative effect is considered. Development on the site may result in surface water run-off, a negative impact. The River Culm flows along the north and west boundaries which may result in fluvial flooding.	-2	Criteria within the policy seek the retention of area within the flood plain as green infrastructure. Policy S11 supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Development should be focussed in areas of least flood risk first and ensure any development in flood zone 2 and 3a are compatible with these flood zones, overall a neutral effect.	0
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. The option would result in the loss of Grade 3 good to moderate quality agricultural land, a slight negative effect.	-1		-1
E) Promoting economic growth and employment	Proposed policy will help deliver 15,000 sqm of employment floorspace that will contribute towards bringing jobs into the area, a significant positive effect. Criteria within the policy seek a suitable amount of employment floor space, a positive effect. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site.	+3		+3
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect.	0		0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0		0
H) Ensuring community health and wellbeing	The site is located some distance from the main part of the town, which would reduce opportunities for walking to work. The option may have an impact on Cullompton Air Quality Management area which will require some mitigation not currently set out in a policy.	-2	The policy requires implementation of a transport plan and other measures to minimise air quality impacts.	-1
I) Delivering the necessary infrastructure	There are capacity issues at J28 however improvement works are planned. Suitable highways access is unknown.	-1	Criteria within the state that the development cannot come forward until improvement works to J28 have taken place. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once developed, development will be permanent. The site could come forward in the short-medium term, given that improvements to J28 are due to take place in the near future.
Spatial extent: (District wide / local)	Development would be focussed in Cullompton, the second town in the district with good connections to the M5 strategic road corridor, but the employment here could have a wider draw across the district and beyond.

NE Part of Kings Mill, Cullompton

Option

A site of 3.3 hectares at Kings Mill Industrial Estate could be allocated for employment development, subject to; a suitable amount of floorspace (potential for 6,930 sq metres of employment floorspace), vehicular access, no development until necessary improvements to M5 Junction 28, Sustainable Urban Drainage (SUD), retaining of areas within flood plain and Green Infrastructure.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area and is typified as being an open, low lying flat landscape which is agriculturally prosperous. There is a view from the distant ridgeline to the east, a slight negative effect.	-1	Policy S9 'Environment' and DM1 'High Quality Design' in the Local Plan Review also provide some mitigation therefore a neutral effect is considered.	0
B) Protection and promotion of a quality built and historic environment	This site lies in an area of archaeological potential. Ground disturbance in this area may therefore expose archaeological deposits, a slight negative effect. The Historic Environment Team would therefore advise that any planning application for the development of this site should be conditional upon an appropriate programme of archaeological work being undertaken in mitigation for the impact of the development upon the heritage assets that may be affected by development within the site.	-1/?	Criteria within the policy seek mitigation measures through archaeological investigation.	0/?
C) Mitigating the effects of climate change	The south east boundary of the site is directly adjacent to flood zone 2 and 3. As the site is proposed for commercial development a number of uses could be classed as 'less vulnerable' development and would therefore be compatible with Flood Zones 1, 2 and 3a, therefore only a slight negative effect is considered. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation. Development of the site may result in increased surface water run-off, a negative impact.	-2	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. 			first and ensure any development in flood zone 2 and 3a are compatible with these flood zones, overall a neutral effect.	
D) Safeguarding and minimising resource use	Development option is located on greenfield land which would be lost if this site is developed. The option would result in the loss of 3.3ha of Grade 3 good to moderate quality agricultural land, a negative effect.	-1		-1
E) Promoting economic growth and employment	This site has planning permission for B1, B2 and B8 uses, equating to 22,064 square metres of employment floorspace. One unit to the northwest (adjoining the site) has been built under a separate consent. Road access is in place but there are no serviced plots on the remaining land as yet. Proposed policy will help deliver 22,064 square metres of employment floorspace that will contribute towards bringing jobs into the area, a significant positive effect. Criteria within the policy seek a suitable amount of employment floor space, a positive effect.	+3		+3
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect.	0		0
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0		0
H) Ensuring community health and wellbeing	The site is located some distance from the town centre but within walking distance of a bus route, a slight negative effect. Option will have an impact on Cullompton Air Quality Management area which will require some mitigation.	-2	The policy requires implementation of a transport plan and other measures to minimise air quality impacts.	-1
I) Delivering the necessary infrastructure	There are capacity issues at J28 however improvement works are planned. Suitable highways access is unknown.	-1	Criteria within the state that the development cannot come forward until improvement works to J28 have taken place. Policy S8 also provides mitigation by setting out	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once developed, development will be permanent. The site could come forward in the short-medium term, given that improvements to J28 are due to take place in the near future.
Spatial extent: (District wide / local)	Development would be focussed in Cullompton, the second town in the district with good connections to the M5 strategic road corridor, but the employment here could have a wider draw across the district and beyond.

Land South of Springbourne, East of Exeter Road, Cullompton

Option

A site of 1.7 hectares at land south of Springbourne could be allocated for employment development, subject to; a suitable amount of floorspace (potential for 4,760 sq metres of employment floorspace), vehicular access, no development until necessary improvements to M5 Junction 28, Sustainable Urban Drainage (SUD), retaining of areas within flood plain and Green Infrastructure.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural	This sites falls within the 'Upper farmed and wooded valley slopes' landscape character area. These areas are typified by having a steeply	-2	The topography of the site would result in the need for sensitively	-2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
environment	rolling landform, being a lush and fertile land which gives rise to extensive tracts of medium-scale fields of permanent pasture. The site slopes steeply from the west to the east and contains a number of mature trees around the edge of the site. The site overlooks an adjacent property and it broken up into two agricultural fields. The site can be viewed from the west and the east and has a high visual impact, a negative effect.		located development. Introduce measures to protect and strengthen trees, hedgerows and other environmental features which contribute to the character and biodiversity, maintaining a wildlife network. A negative effect is anticipated.	
B) Protection and promotion of a quality built and historic environment	There is no anticipated archaeological impact, a neutral effect.	0		0
C) Mitigating the effects of climate change	The site is located in Flood zone 1 the lowest probability of flooding, a neutral effect. Development on the site may result in increased surface water run-off. A negative impact. One Critical Drainage Area is identified at Cullompton. A Flood Risk Assessment will be required at the planning application stage to determine specific recommendations for mitigation.	-1	Policy S11 supporting text acknowledges the Critical Drainage Area at Cullompton which provides mitigation. Criteria within the policy seek the provision of sustainable urban drainage schemes to deal with all surface water the development and arrangement of future maintenance, an overall neutral effect.	0
D) Safeguarding and minimising	Development option is located on greenfield land which would be lost if this site is developed. Option would result in the loss of 1.7ha of Grade 3 good to moderate quality agricultural land, a slight negative effect.	-1		-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
resource use				
E) Promoting economic growth and employment	Proposed policy will help deliver 4,760 square meters of employment floorspace that will contribute towards bringing jobs into the area, a positive effect.	+2		+2
F) Supporting retail	Site option does not result in the loss or gain of retail development, a neutral effect.	0		0
G) Meeting housing needs	Site option does not result in the loss or gain of housing land, a neutral effect.	0		0
H) Ensuring community health and wellbeing	The site is located adjacent to the Cullompton Bowling Club however there is no anticipated loss of this facility, a neutral effect. The site does not have access to a designated foot/cycle path and is located some distance from the town centre, a slight negative effect. Option will have an impact on Cullompton Air Quality Management area which will require some mitigation, and there are concerns that certain types of employment in this location could draw additional HGVs through the town centre.	-2	The policy requires implementation of a transport plan and other measures to minimise air quality impacts.	-1
I) Delivering the necessary infrastructure	Suitable highways access is unknown, hence inclusion of criteria within the policy which seek a suitable vehicular access.	-1/?	Criteria within the state that the development cannot come forward until improvement works to J28 have taken place. Extension of the existing footpath along the B3181 to connect up to the site. Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0/?

Secondary/cumulative/synergistic effects:	The cumulative impacts of the development of this site has the potential to impact upon

	the traffic, put pressure on services and facilities and the current provision of infrastructure should be mitigated by the policy and supplementary policies which are promoted in the supporting text. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre and capacity issues at Junction 28 of the M5. Overall the development of this site will help meet the housing needs of Cullompton and the district as a whole.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Once developed, development will be permanent. The site could come forward in the short-medium term, given that improvements to J28 are due to take place in the near future.
Spatial extent: (District wide / local)	Development would be focussed in Cullompton, the second town in the district with good connections to the M5 strategic road corridor, but the employment here could have a wider draw across the district and beyond.

Crediton Preferred Site Allocations

Policy CRE1: Wellparks

A site of 22.9 hectares at Wellparks, A377, is allocated for residential development, subject to; 185 dwellings, with 28% affordable housing, 2,220 sq of commercial floor space, 15 hectares of green infrastructure, landscaping which reflects the sloping and visible nature of the site and which protects the setting of Downes Historic Park and Garden. A site design brief should be included within any planning application.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site falls within the 'Lowland plains' landscape character area which is typified by being open, low lying and agriculturally prosperous. The site sits on a slope, rising to the north away from the A377. Development of the site would result in the loss of the agricultural fields which are visible on the right when approaching Crediton from the Exeter direction. The presence of existing buildings on the south east part of the site, which are to be re-used, would mitigate some of the impact, as would the presence of recent development to the south of the site. Some impacts would be expected	-2	Criteria within the policy requires layout, design and landscaping that reflects the sloping, visible nature of the site and and makes provision for 15 hectares of Green Infrastructure on the upper slopes of the site. The northern area of the site is designated as green	-1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	however. The existing and disused buildings could harbour protected species (bats and or owls are known to make use of abandoned buildings). However, at this stage, the Council is not aware of the presence of protected species or habitats (a phase 1 habitat survey undertaken when the site was allocated did not note the presence of protected species).The more northerly parts of the site are most elevated, and therefore are most sensitive to development. In terms of wider landscape impacts, the adjoining development to the south will provide a degree of mitigation. A negative impact on the natural environment is anticipated as a result of developing this site.		infrastructure within the policy, and is not proposed for development.	
B) Protection and promotion of a quality built and historic environment	The site sits between the Crediton Conservation Area (to the west) and the local historic park and garden of the Downes Estate (to the east). A large part of the site is formed of the 'Wellparks' grade II farmhouse and farmstead complex. The setting of this site has traditionally been rural, given its separation from the town. However, urban encroachment has already begun to bring the site within the semi-urban fringe, particularly with the recent supermarket development to the south. A number of listed buildings also adjoin the south east corner of the site. Whilst the conservation area lies to the west, the site is largely screened from views from within the conservation area by the steep topography immediately to the west of the site. The development of the site would further impact on the historic value of the buildings. To the east of the site lies the historic estate of Downes. It is not anticipated that development of this site will impact on Downes given the topography which separates the sites. The impact on the built and historic environment is considered to be a negative effect.	-2	The policy contains provisions that development should respect the setting of Downes. Development is subject to layout, design and landscaping that reflects the sloping, visible nature of the site, locally distinctive design and the need to protect the setting of Downes Historic Park and Garden and respect the character and setting of the listed buildings at Wellparks and Downes House.	0
C) Mitigating the effects of climate change	The entirety of the site falls within flood zone 1, being the area of least flood risk but is in close proximity to the floodplain. The sloping nature of the site means that surface water run-off could be problematic once the site is developed.	-1	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
			run-off and arrangements for future maintenance. Overall, the inclusion of a Sustainable Urban Drainage (SUD) scheme is thought to mitigate any negative impacts on local flood risk. This development is proposed as a mixed-use proposal and such schemes give residents the opportunity to live in close proximity to their place of work, thereby reducing the reliance on travel to further places of employment, reducing carbon emissions as a result. A positive impact.	
D) Safeguarding and minimising resource use	This is a greenfield site which is currently within an agricultural use. The whole site is grade 3 agricultural land, which would be lost if the site was developed. Though not the highest quality agricultural land, development of the site would have a negative impact on this indicator. The south east corner the location of the employment is a previously developed site, consisting of a number of existing farm buildings. Though some new buildings are proposed, the re-use of the existing buildings minimises the need for significant new building, and reduction of resources needed for their construction.	-2		-2
E) Promoting economic growth and employment	Crediton has had limited employment development within recent years, and this site could meet a large proportion of the town's employment needs and creating local jobs. Proposed policy will help deliver 2,220 square metres of commercial floorspace that will contribute towards bringing jobs into the area, a significant positive effect. Criteria within the policy seek a suitable amount of employment floor space, a positive effect.	+2		+2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.			
F) Supporting retail	The policy contains no retail proposals; however, retail does fall within the overall definition of commercial development. It is possible, therefore, that retail proposals could come forward on these sites if allocated. The supermarket and high street are both in relative close proximity to the site, and would benefit from the custom of the residents from this development. There would be a positive effect.	+1	Any such proposals would also need to be considered against sequential test set down in the 'Development outside town centres' policy. This should mitigate any harmful impacts against existing retail.	+1
G) Meeting housing needs	Crediton is a town with challenging topography, with few sites likely to be able to contribute towards meeting the housing need. This site would be able to meet a large proportion of Crediton's estimated housing need over the plan period. The policy also includes provision for 28% affordable housing, thereby providing a significant proportion of new housing within the town for those unable to access housing via other means. Overall, the impact of the policy is very positive.	+3		+3
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctor's surgeries, schools and a non-emergency hospital. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. The site is located off the A377, and adjacent to the new link road. Employment traffic generated by the site will be able to make use of the link road (when heading towards Tiverton), or via the A377 direct to Exeter, only needing to drive through the town centre when heading west along the A377. There will likely be some negative off-site air quality impacts as a result however. Option will contribute towards light and noise pollution, a slight negative effect although this is likely to be considerably alleviated now the new link road is complete. This housing site will be accessed via the link road, with residents bound for Tiverton or Exeter not needing to drive through the town centre. Development of the site is therefore unlikely to have a negative impact on existing air quality within the town	-1	The delivery of green infrastructure as part of the site will be accessible by residents, and could include a mixture of play equipment, footpaths amongst other features and could therefore be considered to have a slight positive impact on the health of residents.	+1

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	centre.			
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. It directs traffic away from the town centre and the canyon-like Exeter Road. The Mid Devon Community Infrastructure Evidence Report has incorporated pupil generation impacts of developments which have already secured permission but not yet been built, such as Wellparks. These pupils have been included in the projected number on roll for Spring 2017, to reflect anticipated future pupil numbers. Developer contributions will be required in order to fund these improvements. Overall, the infrastructure is already in place, or nearing completion. Given that the site will be accessed via the new link road. The delivery of this site may put the primary schools under short-term pressure, but the development could support their longer-term expansion. The overall impact is therefore considered to be neutral.	0	Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and facilities; overall a neutral effect is considered.	0

Secondary/cumulative/synergistic effects:	The development will help meet the economic and housing needs in Crediton including affordable housing. Development of the relief road contributes towards reducing traffic in the town with a consequential positive impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time for this site is 4 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing and economic land within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Policy CRE2: Red Hill Cross, Exhibition Road

A site of 3.1 hectares at Red Hill Cross is allocated for residential development, including provision of 135 dwellings (of which 28% are to be affordable), landscaping to reflect the sloping nature of the site, a footpath link to Old Tiverton Road, extension to the cemetery.

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site sits on the border of two landscape character areas, the 'Lowland plains', and 'Sparsely settled valley floors'. This reflects the site's position above but in relatively close proximity to the flood zone around the River Creedy. It is on rising land, and is visible when approaching Crediton along the A3072. There will be a visual impact when heading into the settlement, as only a limited amount of housing is visible, when heading in this direction at present. Therefore a slight negative impact has been scored.	-1	The policy seeks a layout, design and landscaping that reflect the local distinctiveness, the visibility of the site and its sloping nature.	0
B) Protection and promotion of a quality built and historic environment	There are no heritage designations in close proximity to this site. A neutral impact is therefore anticipated.	0		0
C) Mitigating the effects of climate change	The site is located in flood zone 1, but is in very close proximity to the floodplain. Its elevated nature means that it is unlikely to be at risk of flooding, but surface water run-off from the site could exacerbate periodic flooding of the nearby River Creedy.	-1	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Overall, the inclusion of a Sustainable Urban Drainage (SUD) scheme is considered to mitigate any negative impacts on flood risk, and therefore a neutral impact has been anticipated.	0
D) Safeguarding and minimising resource use	The site is grade 2 land, being high quality agricultural land. Approximately only 11% of land within the district is within the grade 2 category. Therefore, the loss of this land has a negative impact on this indicator.	-2		-2

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
E) Promoting economic growth and employment	The policy contains no commercial development proposals, however, there is an economic benefit associated with the delivery of sites for housing. Development of this scale would be a boost to local construction firms and associated trades who would benefit from being able to undertake contract work on the site. There would therefore be some positive impact.	+1		+1
F) Supporting retail	The policy contains no retail proposals. Future residents of the site may undertake their shopping within the town centre, providing it with an additional customer base. The town centre is walkable, but is some distance from the site. Whilst there may be some positive benefit to local retail.	+1		+1
G) Meeting housing needs	This site makes a significant contribution towards meeting the housing needs of the population of Crediton. The policy contains a requirement for 28% affordable housing. The mix of dwellings to be achieved on site is already specified within a supplementary planning document, and will be tailored to achieve the appropriate balance. The site sits adjacent to existing bus routes ensuring that residents who do not own a car can access services and facilities within the town.	+3		+3
H) Ensuring community health and wellbeing	Crediton has a wide variety of services, including doctors surgeries, schools and a non-emergency hospital. Crediton is currently designated as an Air Quality Management Area, due to poor air quality within the town centre. This is likely to be considerably alleviated now that the new link road is complete. Residents living at the new development will not be required to drive through the town centre when accessing Exeter or Tiverton, thereby minimising any potential negative impact on local air quality. Overall, the impact is considered to be neutral.	0		0
I) Delivering the necessary infrastructure	The provision of the Crediton Link Road represents a significant upgrade to the local road network. It directs traffic away from the town centre and the canyon-like Exeter Road. The Mid Devon Community Infrastructure Evidence Report has incorporated pupil generation impacts of developments which have already secured permission but not yet been	0	Policy S8 also provides mitigation by setting out that developers will be expected to contribute to, or bear the full cost of, new or improved infrastructure and	0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	built, such as Red Hill Cross. These pupils have been included in the projected number on roll for Spring 2017, to reflect anticipated future pupil numbers. Developer contributions will be required in order to fund these improvements. Overall, the infrastructure is already in place, or nearing completion. The delivery of this site may put the primary schools under short-term pressure, but the development could support their longer-term expansion. The overall impact is therefore considered to be neutral.		facilities; overall a neutral effect is considered.	

Secondary/cumulative/synergistic effects:	At present the extent of the built environment is relatively well contained within the landscape and is not often visually prominent. Allocation of edge of town of sites will help to meet Crediton's housing need but would likely have landscape impacts given the surrounding steep local topography. The development will help meet the housing needs in Crediton including affordable housing. Development could contribute towards traffic in the town with consequential impact on air quality within the town centre.
Temporary/permanent effects: Timescale: Short (1-5 years), Medium (6-15 years) Long (15+ years)	Within the short term, construction traffic associated with the development will contribute towards traffic increase within the town. The estimated development time for this site is 4 years. Once developed, development will be permanent.
Spatial extent: (District wide / local)	This site option will help provide housing within Crediton including for affordable housing. Development would be focussed in Crediton, the third town in the district.

Policy CRE3: Cromwells Meadow

A site of 1.3 hectares at Cromwells Meadow is allocated for residential development including provision of 35 dwellings (of which 28% are to be affordable).

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
A) Protection of the natural environment	The site sits on the border of two landscape character areas, the 'Lowland plains', and 'Sparsely settled valley floors'. This reflects the site's position above but in relatively close proximity to the flood zone around the River Creedy. It is on higher ground than the nearby floodplain, and is partially	0		0

Sustainability objective	Commentary	Impact	Mitigation	Post Mitigation
	visible when approaching Crediton along the A3072. There will be some visual impact when heading into the settlement, but some housing is already visible from the existing Cromwells Meadow estate, which is on higher ground than the proposed site, and which thereby mitigates against any impact.			
B) Protection and promotion of a quality built and historic environment	There are no heritage designations in close proximity to this site. A neutral impact is therefore anticipated.	0		0
C) Mitigating the effects of climate change	The site is located in flood zone 1 with 3% of the site along the eastern boundary being within flood zone 2. The site boundary was amended to make the site smaller taking out the majority of the flood zones 2 and 3. The majority of the site is on rising ground and is unlikely to be at risk of flooding, but surface water run-off from the site could exacerbate periodic flooding of the nearby River Creedy. There are no specific criteria within the policy regarding the inclusion of renewable energy developments. Development on the site may increase surface water run-off, a negative impact.	-2	A policy requirement in the Local Plan Review seeks mitigation measures through the provision of Sustainable Urban Drainage Schemes to deal with surface water run-off and arrangements for future maintenance. Overall, the inclusion of a Sustainable Urban Drainage (SUD) scheme is considered to mitigate any negative impacts on flood risk or surface water run-off, and therefore a neutral impact has been anticipated.	0
